♦ Regarding the *corpus* of Deleuze – which I hesitate to include in my collection, a 'cabinet of corpses' as my anonymous reader will call it – I note precisely its vital productivity, as also witnessed by its proliferation into 'several Deleuzes', by the fervent production of Deleuze studies, conferences, journals, symposia, and so on. Certainly, the work is alive. And yet, someone is dead. What difference does it make to the future, to future writing, that there will be no more texts arriving in the future? Ought (not) the corpus – by virtue of its exposure and lack of defences – impose a certain limit (boundary)? Demand of us an audacious modesty? A reserve

and prudence, also in the sense these words have in the erotic domain in relation, precisely, to an other's corpus?

PART II

Hypotheses

The oblique path I will be plotting here does not lead around the work ('autour de travail') of Deleuze, or encircle (define, delimit, outline) the body that bears his signature without being self-contained. A relation more distant (circumspect), though not any less violent than the reverent *touch* of the faithful disciple, will be sought here. In fidelity to Deleuze – whose philosophical portraits, to borrow a Derridean idiom, 'faithfully betray' their subject, and who laments the failure of *application* ('travail médiocre, travail raté') but marvels at the speed with which the thought of Bergson moves – the immodest ambition pursued here is to make a Deleuzian move, however minor and modest: to breach a passage to a plane where death may be posited as *something* (creative). It is on that plane, and only at the very end of this journey, that I hope to intersect with, and perhaps even succeed to intercept, Deleuze.

As for meeting, or rather, evading, not entering, my interlocutor's objection to an overvaluation of 'my' presence, these will be my order-words: do not speak of 'my' death, do not speak of the death that is – in so far as it *is* – essentially (*wesenmässig*, says Heidegger) *mine*; do not mistake, in other words, death for the dying (*mourir*) that is indeterminate: co-terminus with a life, with *living* dying, with the dying that is *living*; nor speak of death as an abstraction: a rarefaction/subtraction or an absolute – each time the end *of* the world ('chaque fois la fin du monde comme totalité unique' [Derrida 2001: 9]). Approach it instead as the production of an event *in* the world – impersonal, belonging to no one, even though it is always someone or something that dies, someone or something that must die for it.

I will search neither for *(a)signifiance* nor calibrate indifference, but ask instead: what absolutely new immaterial thing is the creation of death and death alone? What irreducibly *new* reality does the death of any animate being – a man, a dog, or a fly – introduce for the living into the flux of flowing matter, transforming the order of relations within (the Whole, *le Tout)* – irreversibly? And one must speak of an event for the *living*, for the disjunction between dying and death is also confirmed by the animal. Even if we grant to Heidegger that the animal cannot

die, it does encounter, has the capacity to experience the encounter with the cadaver. Writing in the summer of 2004 for a dying Derrida, who questioned Heidegger on this very point of the poverty of the animal ('weltarm', 'weltlose' [Derrida 2006]), Cixous reminds us of the heartrending scene in Joyce's *Ulysses* where the dog Tatters undergoes the 'experience of the encounter with the cadaver: "He stooped, stalked around it, brother, nosing closer, went round it, sniffing rapidly like a dog all over the dead dog's bedraggled fell . . . Here lies poor dogsbody's body" ' (Cixous 2007: 177). What the animal example (of which there are many) confirms is not the common 'subjectivity' of man and animal but, on the contrary, the exteriority of the event as irreducible to the 'subjective' dimension of an interior experience, whether or not we would reserve the latter as unique privilege for the 'subject'.

The truth of the cadaver – as hypothesis I have named it in advance – is as liberating (from dread and anxiety) as it is counter-intuitive: it is, it gives (*es gibt*) the first Image. In other words, we do not know what an image is. Common usage and its very Platonic conception – victims of an *objective* (structural) illusion – fail to grasp the profound reality of the image: that it does not come 'after' its object (as secondary representation, reflection, imitation, copy); rather, it is made *after* (in the image of) the first Image, which is neither representation (of something on the outside) nor a (natural) reflection or repetition in the water's mirror (whose mirage needs the presence of a Narcissus or a snow-capped mountain on the outside in order to reflect it, as absent, on the inside). The model to which every image bears resemblance and whose resemblance ('image') qua image it repeats is the cadaver. The cadaverous of every image is a memory image, in remembrance of the cadaver as the first Image.

All this already resonates with, or rather, finds *a posteriori* expression, as we will shortly see, in the principal motif that governs Godard's cinema: an image that deserves the name is never a *solitude*, but an act of memory. It recalls other *images*.[4] The initial insight, however, I owe not to Godard but to Blanchot – and this is not the first time that I turn to him to negotiate the difficult non-passage the Deleuzian fold introduces in the field that is contemporary thought.[5] By a strange coincidence, it is also the same passage as before that now takes me outside the old dilemma (another kind of non-passage) between sense and nonsense, significance and indifference, reverence and calculation (Baross 2000). 'The strangeness of the cadaver', says Blanchot in his seminal essay, 'Les deux versions de l'imaginaire', 'is also the strangeness of the image' (Blanchot 1962a: 266).[6]

I cannot retrace here the path along which Blanchot dissolves his analogy and posits the cadaver as itself image par excellence. I cite only the three conclusive moves. The *first* detaches the cadaver from 'this' world: 'what we call mortal remains evades common categories: something is there before us, which is neither the living in person (*le vivant en personne*), nor any sort of reality, nor the same as the one who was alive, nor an other, nor another thing' (Blanchot 1962a: 268). The *second* complicates this first thesis: establishes the cadaver as pure image to which then it immediately confers the status of first Image.

If complication means movement, thought passes here as Deleuze would want it: with infinite speed, from one *niveau* to another, from an actual to a virtual real within the space of only a few phrases. In order to preserve the rich linguistic *ambivalence* that *drives*, literally, Blanchot's meaning in two different directions, I cite the original: 'Qu'on le regarde encore, cet être splendide d'où la beauté rayonne: il est, je le vois, parfaitement semblable à lui-même; il se ressemble. *Le cadavre est sa propre image*' (Blanchot 1962a: 270–1, emphasis mine). ('If we look at him (it) again, this splendid being that radiates beauty: it (he) is, I can see, perfectly like itself (himself), it resembles itself. *The cadaver is its own image*.')[7] Thought, we can see, traverses the length of these phrases, its movement passes along the effects of language, relying for its passage on the sliding of meaning in the place of the strategically positioned pronouns – 'il'/'le'/'lui-même'. Their referent, in Blanchot's *precise* phrasing, remains rigorously undecidable. Simultaneously 'he'/'him' and 'it'. But if meaning hesitates, if the semantic play oscillates between the personal and impersonal, between a splendid being that retains something subjective ('il', the 'departed') and the splendid being of the *cadaver itself* – thought breaches a passage. It makes its move, slides from actual to virtual object on different planes, at the very place (of the pronouns) where the two 'objects' are simultaneously co-present. It slides, however, without deciding the undecidable, without attributing their difference. Complicating rather than replacing the first thesis, it turns the linguistic indetermination into a more complex formulation, extracts from the cadaver its *own* (*propre*) image: it perfectly resembles *itself* (*parfaitement semblable à* lui-même), it *is* its own image.

Having established the cadaver as pure image, Blanchot immediately confirms it, with the *élan* of the same uninterrupted move, as the *first* image: 'This is why [because the cadaver is its own image] the living, in fact, is still without resemblance.' Self-resemblance, that is, pure image,

is a posthumous acquisition. It arrives with and to the cadaver. Blanchot is very precise on this last point and even interrogates himself as to the (in)accuracy of the expression: '(parfaitement semblable) *à lui-même*'. But no, he says, after having given way to doubt, it is the right formula. 'Lui-même' designates a 'being impersonal, removed and inaccessible' (Blanchot 1962a: 270). It has no longer any relation with this world, where it still appears, *except that of an image*.

The *third* and final move completes the dissolution, dispenses with every form of analogy and parallelism between image and cadaver, by eliminating the last remnant of an absent referent: 'if the cadaver resembles to such a degree it is because, at a certain moment it is resemblance par excellence . . . It is the *semblable* [here neither 'likeness' nor 'equivalence' in the two existing translations would do], *semblable* to an absolute degree . . . But what does it resemble? Nothing' (Blanchot 1962a: 271).

The Cadaver-Image

The cadaver is its own image. But what does this mean? A repetition of the same without difference? Or as Blanchot says, an object 'doublé par soi, uni à la solennelle impersonnalité de soi par la ressemblance et par l'image' (Blanchot 1962a: 270)? An object incessantly sinking back to its own image as the unity of two aspects, an actual-virtual in perpetual exchange? Or rather, the cadaver is itself (the pure effect of) this exchange? Either way, if an image resembles (repeats this) cadaverous duplicity, it will not do so as mere reflection or weak, secondary copy. On the contrary, it is starting from this tremor on the interior – itself a repetition of the first re-semblance – that an image will summon and be summoned by other images. It is by virtue of this (virtual) vibration that it has the *potentia* to recall and be recalled, to haunt and be simultaneously haunted by other images – that is, to *give* birth to memory that comes to pass (takes place) only in the *medium* of the image.[8] It is also owing to this tremulous inner vibration that an image has the power to forge pure image-relations: montage and circuit. The one gives birth to something more powerful than the expressed power of any one image: a montage effect; the other – simultaneously with the first but taking place on another plane – constitutes multiple series: circuits that at once remount the past and open (to) the future.

Herein lies the first paradox and the reversal of the mytho-poetic fantasy that translates the cadaverous into something demonic, a

vampiric power that feeds itself on life. Clichés for this image abound, especially in early cinema, which cultivates, indeed, narcissistically nourishes (itself on) this myth. 'Picturing' the dark forces animating and emanating from the image (see Wegener's *Student of Prague*, and several early adaptations of Poe's *The Fall of the House of Usher*), silent cinema indirectly re-claims those forces for itself. And yet, the vampiric is not the truth of the image, whose power lies elsewhere. In fact, it is not the image but the word that opens a gaping hole in the universe. ('When I say "this woman" ', writes Blanchot elsewhere, 'this person who is here right now . . . plunge(s) into nothingness' [Blanchot 1981: 42].) The image, on the other hand, in so far as it paradoxically bears the mark and memory of the work of death, gives birth to something absolutely new. And with the cinema, as we will see, it accomplishes a miracle: a future that is open to the future.

'Why not concentrate on the dying involved in repetition?' asks another missive from my interlocutor. Certainly, there is death in repetition: the next beat comes to/takes the place of the previous one, on whose passage its own coming to pass depends. But the cadaver *is* repetition. It resembles *itself*, is repetition in the same place, which is why 'the cadaver is not in its place' (Blanchot 1962a: 269). 'Its' place is where all foundation founders. A heterotopia (Foucault), it does not communicate with any other space, just as the remains, the object-thing in the room, does not compose with any other thing: the familiar furniture, the scattered sheets of paper on the desk, the jacket hanging in the closet. Together with the 'departed', these are at an infinite distance from the 'thing' in the room.

Still, the cadaver is no (simple) thing. On the one hand, it resembles *itself*: it is a self-same without difference *and* a double without being a fusion (amalgam) – both at once, simultaneously. On the other hand, it *resembles* itself: *is* resemblance. Resemblance constitutes its being, which is neither incarnated nor tangible ('indéplaçable, intouchable', says Blanchot [1962a: 269]), nor an inert effigy, a look-alike that Merleau-Ponty called, apropos the Cartesian who cannot see *himself* in the mirror, a *mannequin*. Not unlike the close-up in whose faciality Deleuze intuits precisely the duplicity of the cadaverous – 'réfléchissant et réfléchi'[9] – the cadaver-image is neither actual nor virtual but the pure effect of their exchange. It *is* re-semblance: the trembling repetition of a semblance that incessantly refers back to itself as if to its double or reflection. A pure effect (virtuality), the cadaver *is*, as an electric current *is*, as a musical tone *is* – as long as the vibration continues. But until then,

it is image without being the image of anything else. As Blanchot says, it resembles 'nothing'.

Even less so than Plato's *phantasma*, this pure image has no place in 'this' world; it is at an infinite distance both from 'here' where we are, standing just next to it, and from the departed, who was still with us perhaps just a few minutes ago. Except that this 'few minutes ago' (or two days ago, or two hours ago) does not compose with the *time* of the cadaver either. (Heterotopias are thoroughly 'chronique', temporal, says Foucault [1986: 22].) To the heterogeneity of the site in space, to the loss of every foundation ('l'absence et la perte de tout fondement') corresponds, here in the room, something *in* but also *of* time. The time of the cadaver cuts into the flow of *durée*, into the seamless continuity of ex-changes, metamorphoses, mutations, becomings. For this reason we cannot speak of 'cadaver becoming'/'becoming cadaver'. The latter is not only discontinuous with everything else (here and now) but also with the dying, which it does not end and which, in so far as it is co-terminus with life, is unending.

Dying is interminable ('mourir n'aboutit pas à la mort', writes Blanchot elsewhere [Blanchot 1962b: 103]), but the cadaver is incessant. Unlike the interminable, the incessant is not continuous, it only cannot stop continuing (the dog barked incessantly). If it is impossible to speak of 'becoming cadaver', it is equally without sense ('sans sens', as Nancy would say) to speak of the cadaver's becoming. Incessant, it does not cease to re-semble itself, 'to be' the pure effect of the same semblance re-sembling itself in the same place. A pure virtuality – and here I already borrow Deleuze's language with regards to the time-image: 'an actual-virtual circuit on the spot' (Deleuze 1989: 80), and nothing else. At least for a little while, until the re-semblance collapses and the object sinks back to the world of things, the flux of matter, where it once again composes with other things: the soil, the air, liquid matter ... and the worms, which 'in the context of "immanence, a life" ' – as my irreverent interlocutor reminds me – have their right to its elements.[10]

The cadaver's inner vibration is what every image qua image repeats. This is its only possible mode of repetition (the *miracle* of Lazarus is not the resurrection of the already putrid corpse but the impossible possibility of the second cadaverisation). It is the effect of this cadaverous repetition (there is death in repetition) that Narcissus recognises and *surrenders to* in the trembling surface of the water's mirror as he cries out: 'I recognise my own *image*!'

'Fatal beauty', says Godard of the cinema (Godard 1988b: 2B).

Cadaver/Crystal

Incessant vibration, the false movement of perpetual exchange in the *same place* – this does not translate to movement-image, which is a temporal perspective, a mobile cut in duration. The effect of repetition rather than of movement, the cadaver-image and the cadaverous of the image correspond with an altogether different sort of temporal reality: that of the time-image.

This hypothesis, we said, is not born out of perception or observation. The 'image' (cadaver as time-image) is conceptual: transformative, productive of a possible world. It will not be, therefore, derived from the direct experience of encountering the cadaver. Confirming one more time the profound affinity linking image to thought (Godard: 'the cinema is a form that thinks'), the concept is mediated by the (cinematographic) image. It appears that the principle of reversibility that Deleuze applies to the direct time-image holds here as well,[11] holds especially well with regard to the first time-Image – the revelation, or better still, the *pedagogy* (Serge Daney's term for Godard's cinema) of the photographic/cinematographic image. It is the most recent of images that give the cadaver-image visible form, repeat it in the depth of their interior, as the pure virtuality that since time immemorial has been haunting the image. A vertiginous anachrony, indeed. But this belatedness is not fortuitous; it is not by chance that the *révélateur* (in the photographic sense of the 'developer') of this *phantasma* is machine-made and mechanically reproduced: image by repetition. Consequently, this revelation too is an affair of time, is indissociable from the temporalising of the machinal and the machinery of image itself.

Images, as is well known, temporalise. The photographic image, and this is Barthes's lesson, contracts a whole life time into a single divided instant – always according to the same formula, whether or not the subject is dead, says Barthes: 'he is dead and he will die'.[12] Despite the name, the *still* photograph does not *capture* the immobile reality of a single instant that it cuts into duration; it rather *fashions* a new temporal reality: the *simultaneity* of two *incompossible* times – a present past ('he is dead') and a future present that actually or virtually will have also passed ('he will die'). In the space of the photograph, says Derrida, 'we are already haunted by the future that carries our death'. 'Notre disparition est déjà là' (Derrida and Stiegler 1996: 131). It awaits the cinema, however, to perfect the art of the cadaverous, its art as cadaverous, now in the above-defined sense of the term. Without letting go of the photographic accomplishment, the moving image shakes off

the funerary mortuary function, the haunting that the former 'fixes' (as one fixes precisely an image or a butterfly) in the photograph's own time. It does so, not by the simple (mechanical) addition of movement to the still image, or by mobilising the image itself (the shot becoming a *mobile* cut in duration), but rather by virtue of the apparatus. An apparatus of repetition, a machine for the making of time(s).

Due to the technological nature of the apparatus, 'primitive cinema' already projects images that themselves project: memories of the future, histories that come to pass for the first time in its 'medium' (in every sense of this rich word). With time, the cinema teaches itself to interiorise the cadaverous dimension, to fold it back to itself as the expressed power of its own image. The passage from Murnau's *Nosferatu* to Tarkovsky's *Solaris*, from Dreyer's *Vampyr* (where the camera takes on the perspective of the corpse) to Resnais' *Je t'aime, je t'aime*, measures this displacement/complication. Once detached from a figure – spectre, ghost, or vampire, who cannot die and yet is dying from this inability – the cadaverous is installed, is given new life, in the depth of the images themselves. Due to this complication, the image acquires new powers and inaugurates a new regime: like the hysteric who cannot forget, images now involuntarily remember (recall) other (perception, memory, and world) images, which in turn reciprocally both haunt and *parasite* them, and with which they incessantly compose new – ever deeper, ever larger – circuits of time or time-images.[13] (In a recent example, Wong Kar-wai's *In the Mood for Love*, the repetition of the street light filmed against the beating rain is not a sign for the passage of time: this is another day, another hour, etc.; it functions rather as a refrain which simultaneously effectuates two disconnected regions of time: nesting inside the other is the any-time-whatever that shelters a singular love affair, their meetings and missed encounters, outside the order of world-time. But this latter, which envelops the first, is itself a pure recollection, a crystallised mythical memory-time of an irretrievably lost life-form – not of a person but of a city, Hong Kong.)

Composition is in fact unique to the cinema's method of temporalising. The Deleuzian pedagogy is clear on this point: on the one hand, the cinema forms images with (two) sides (crystals); on the other hand, it assembles circuits or machines that make time (pass). Circuits unite actual and virtual images – perception and recollection, real and imaginary, dream and memory, world and pure recollection, physical and mental images – that continually 'follow each other, run behind each other, and refer back to each other' (Deleuze 1989: 69) around a point of indiscernibility – *the shortest circuit and the simplest crystal*.

I will limit my concern to this most contracted point, unique among the crystals in that it is both limit and circuit. On the one (horizontal) plane, in relation to itself, the purest crystal redoubles over itself: is an actual image and its *immediate* and *simultaneous* double. In one word, it is cadaverous, or in the words of Blanchot, it *resembles itself*. On another (vertical) plane, however, in relations to all other circuits, the same crystal redoubles as *internal* limit that defines an *open* whole; it is taken up (repeated) by a whole as its extreme point and narrow base that bears everything and starting from which all other, vaster and deeper circuits – circuits of the future – develop.

In short, the crystal is the cinema's first and originary time-image. As such it recalls (already assembles with) the other, the cadaver-image – except that the Deleuzian schema appears to exclude this very possibility, permitting only two other positions: the crystal is either the (same as the) cadaver-image, in which case the latter is absorbed into the cinematic whole *with its singularity and irreducible heterogeneity effaced* (with the additional consequence of also depriving the cinema of its power of creating something new); or, alternatively, the cadaver, which is its own image, *maintains no relation* with the simplest crystalline structure or the circuits the cinema fashions – not even a negative relation of the reverse side, since the crystal is *internal* limit and the whole it defines is without an *outside*. In this second case, the cadaver-image simply falls away, it cannot but fail to compose with the cinema (whose creations then come from nothing). In one case, we preserve resemblance but lose the singularity of our object; in the other, we protect its singularity but at the cost of obliterating the resemblance, that is, its status as time-image.

This, in fact, is a false problem. To exit from its dialectic we need to re-inscribe *resemblance* on the interior of the whole, as a thing not of space but of time: as *re*-semblance, that is, repetition. If, as my interlocutor reminds me, there is death in repetition, it is because the interval separating the crystal from the cadaver *in their resemblance* is an abyssal gap *in time*. If, on the other hand, as Derrida also showed us in *Archive Fever*, there is no future without repetition, the interval that repetition cuts in time as its condition of possibility is *creative* of the future. It differentiates. The first condition confers to the resemblance 'cadaver/crystal' a *temporal* reality; whereas the second, which relies on the first, confirms our hypothesis: in *resemblance*, the cadaver-image is taken up as the first time-Image by the cinema, which repeats, that is, differentiates it on a wholly other plane.

This complex relation, we said, is the pedagogy of the image, that is, the effect of a 'secondary repetition' that reveals (revelare: re, 'again' + velum, 'veil') what comes first. In fact, the reprise here is reciprocal and itself forms a 'circuit' of non-chronological time:

a) On the one hand, the cinema's crystal *retrospectively* recapitulates – exhibits for the first time in history – the cadaver-image as itself a time-image, a crystal. If the cadaver resembles itself to such a degree that it is resemblance itself – 'si absolument lui-même qu'il est comme doublé par soi' – it is because it crystallises with its virtual double: '[est] uni à la solennelle impersonnalité de soi par la ressemblance et par l'image' (Blanchot 1962a: 270). Deleuze's 'crystal', however, is not just a name. A concept, it transports Blanchot's cadaver-image to another plane where, as circuit, it composes with other circuits – machines for giving birth to time.

b) On the other hand, the reciprocal effect or backward flow from the direction of the cadaver, now exhibited as a singular time-image, is to make *a posteriori* the cadaverous dimension of the image visible as itself a repetition *in memory* of this first image, which repetition differentiates what it repeats: opens it to the future and opens a future.

The one question that still remains concerns now the singularity of the *cinematic crystal* as internal limit to a whole: where to locate this limit in relation to the creative interval, this operator of difference, *in time*?

On the one hand, the crystal is base and support to *a* whole and not *the* whole, to circuits of time, not to the whole of time. On the other hand, the crystal has two faces or sides; the interval runs through it. One face is turned towards the future, towards (future) circuits the cinema assembles and continues to invent; the other face is towards a non-chronological past that is older than memory, is at an infinite distance from the plural, anachronic times of the cinema and its 'histoire(s)'. Whilst remaining internal to the whole (of Kronos), the crystal cuts a (creative) interval into Time. Starting from one side, it is *seed* for all future circuits (the future times of the cinema), an opening to an open future: the future of the cinema (double genitive) and future cinema. The other side, however, faces the *arché* of the Image, which is also the arch-image *whose repetition gives birth to the cinema*. For what is unique to the cinema is precisely this repetition, which is for the first time in the history of the image and is irreducible to the mechanical reproduction of images, although not separable from it.

In Deleuze, as in Derrida, there is no future without repetition. His third repetition in *Difference and Repetition*, we said, breaks

with the past. But so does the cinema. Even its simplest time-image (the shortest circuit and crystal) differentiates (pluralises) time in time – in the cinema's time.

We see time in the crystal, says Deleuze, in three different states, each of which involves the future (there is time that splits itself in each moment in two heterogeneous directions 'one of which is launched towards the future while the other falls into the past' [Deleuze 1989: 81]; there is time that leaves the crystal, gives itself a future in a leap towards, in an opening of the future [Deleuze 1989: 88]; and, in the crystal in the process of being made, time's dividing into two, its differentiation is the 'bursting forth of life' [Deleuze 1989: 91]). And yet, we said, the cadaver is cut off from the future. It is neither a becoming nor is becoming (something else). Into the flux of becoming, it cuts a non-passage – an *écart*, partially analogous to the living body. But whereas the body's selection/extraction from the flux only *changes* the future of the past (which future finds cinematic expression in the three types of movement image: perception, affection and action image), in the place of the cadaver, a hiatus opens in what we may call *world-time*: things – the traffic of people, objects and words, even animals – flow around it, as if an island in its river. An island of (other) *time* in the river of time.

What is the time of the cadaver? This difficult question asks not in what time it is situated but rather what order of time constitutes it. Tentatively perhaps, we may advance a few propositions: as its own image, the cadaver does not preserve the past, contract all the past lived into the density of the corpse. Nor is it a perpetual frozen present, an *amber* of dead time (a captured and immobilised insect-time). It is not a or the *past* that is captured in the present; it is rather the present that is cut off in its place from the future, from future presents arriving, without which the present present could not be passing. This is exactly what we see in the cadaver-crystal: time at the point of its non-passage, a frozen and paralyzed exchange – a *freeze-frame*, which, as we know from the cinema, is never the same as a simple photograph which fixes time; it itself is fixed in time. In the case of the cadaver-image the actual image and its virtual double are maintained at the point of trembling, on the threshold of reversibility, lacking the force to complete the exchange.

Does this mean that the cadaver is outside time, in an abyss of time? No, the incessant *is* its time or, following Bergson's lesson on time's productivity, the cadaver is the work (*désoeuvrement*) of the incessant as time. What corresponds with it in the temporal region is not an abyss

of time but an abyssal time, which is in time, whence it solicits every other (concept of) time.

The incessant, then, is what we see in the cadaver's crystal – if, that is, we approach it from the direction of the cinema. For this 'vision', as we said, will not be derived from the object-thing in the world as it gives itself to direct perception; it is the revelation (in repetition) of a purely cinematic creation (even if retrospectively, the latter will expose its long presence in literature, in painting): the time-image.

This pedagogy too is reciprocal. Once we begin to see the cadaverous through the cinema's crystal, and vice versa, we learn one more lesson regarding – that is, how to see through – this double lens. It is also here, at this last point and lesson, that our path intersects with, perhaps even constitutes a forcing (fecundation) of Deleuze: if the time-image of the cinema is neither a pure creation nor a secondary copy, but a repetition of the first image, its *differentiation*, its *heterogenisation*, then the stillness of the cadaver teaches something extraordinary about the nature of this differentiation: in the cinema's crystals time passes *once again*; what we witness is a resurrection – of time that passes, the resurrection of the image opens and is itself an opening to the future.

This is how I propose to read Godard's enigmatic formula (an attribution to Saint Paul): 'L'image viendra, au temps de la résurrection' (the image will come at the time of the resurrection [Godard 1998b: 214]). Contrary to common analysis – that the cinema mummifies *durée* (Bazin) – the direct time-image liberates the frozen trembling, the incessant, into a fluid passage. Starting from the shortest circuit it composes ever larger, deeper and more complex circuits, incessantly. In other words, it effectuates a future whole in the course of making itself.

All this not just resonates with – recalls in hallucinatory fashion – Deleuze. It accords with the lesson Deleuze himself learns from the cinema: 'one leaves the theatre to get to life… imperceptibly, on the thread of the stream, that is, of time' (Deleuze 1989: 88).

Postscript: Response to an Anonymous Reader

Let me answer the 'provocation' you sent with your comments by way of a detour – citing Blanchot, who does not think of himself when he writes: the relation between *master* and *disciple* is one of 'infinity' (Blanchot 1969: 5). Infinite here means: a distance not measurable by itself. Paradoxically, this often most intense and personal of relations is also divested of every dimension of the 'subjective' – the genius, the talent, the charm or charisma of the master (even if these attributes

never fail to irradiate the inter-relational space). It is not what the master knows that matters, says Blanchot, but the 'unknown' (*inconnu*) that he represents, which affirms itself precisely in the infinity of their distance. While this formulation may be at some distance from Deleuze, who says, 'Sartre, my master' (Deleuze 2002: 109), we know how crucial the years at Vincennes were for inextricably tying his 'research' to the seminars, for Blanchot, a 'noble way of being together, of thinking according to the division, master–disciple' (Blanchot 1969: 3).

The disciple is someone who has entered (is caught by) the curvature the master's discourse introduces in space and time. This *structural* (impersonal) dissymmetry in turn explains her (fatal) predicament or, as Derrida describes his own situation vis-à-vis Foucault, the 'unhappy consciousness (*conscience*) of the disciple'.[14] She must begin to speak (for speak she must) in the virtual or actual presence of the master, or better still, after his interventions have radically reworked the field, changing the very condition of speech itself.

One temptation – which only intensifies with the death of the master, in the face of a future without more future words or works to come – is a false (corrupting) faithfulness. Foucault called it 'commentary'. Deleuze himself contemptuously described it as turning the master's works into a container of content to be mined for 'significance' (Deleuze 1990b: 17). Ironically, such reading (writing) too opens the path towards an infinite: the infinite exhaustion/rarefaction of the work. 'One will comment, one will interpret, one will ask for explanations, one will write the book of the book, *to infinity*' (Deleuze 1990b: 17).

The other temptation is disputatious contrariety – a re-activity whose self-deceiving comedy Deleuze ever so gently but mercilessly exposes in a patient and long letter to his 'severe critic'. Needless to say, both of these tendencies fail to break with and out of the binding asymmetry. As Blanchot explains, the continuity (of faithfulness) is never continuous enough; discontinuity (discordance) is never discontinuous (divergent) enough. (Perhaps one notable and rare exception is Derrida's 'terribly daring' challenge to Foucault that questions, in the master's presence, the justification of the sense of the latter's 'entire project'. It may be true that only a Derrida can 'break the glass . . . the mirror'; on the other hand, one could also say that, despite his painful protestations, Derrida had never been a 'disciple' of Foucault and his undoing of the infinity of the *relation* as purely subjective, an 'infinite speculation *on* the master', shows him to be already on another path [Derrida 1978: 32].)

As I confess in the essay right away, my writing here is guilty of yielding to the temptation of the second kind. At least initially, for it

corrects itself in its course. Nevertheless, the inspiration to write derives from a re-active impulse: to issue a counter-provocation, to demonstrate to my interlocutor that the measure of the good life – of benediction, salvation – is unthinkable without reference to death, even for Deleuze, whom I try to catch in the course of a series of *gestes*, affirmations that pass through domains indelibly marked by an awareness, an anticipation, a calculation of death. My 'cabinet of corpses', as you call them, is in the service of this counter-demonstration, or, more precisely, is an opening towards such a demonstration as possible.

Possible though not necessary. The path is opened but is not followed through to the end. The project is not rejected or disowned, however – only interrupted when another, new path is opened. The *intuition* leading to this change of heart comes to me only now as I write this postscript in response to your provocation: whether or not death illuminates life or vice versa is a weak question to ask of Deleuze. (Badiou's example comes to mind, whose attempt at reversal – 'this philosophy of life is essentially . . . a philosophy of death' – only leads back to Deleuze [Badiou 2000: 12.3].) In this case, the interruption of the common reflex is accomplished when the writing creates an opening to what it does not yet know. The method for this is a hypo-thesis (I have no time here to recall Derrida's beautiful passages comparing himself to a blind man, thrusting himself forward headlong, guided, as if an antenna, only by a *hypo*thesis [Derrida 1993: 2].) Mine is fashioned after Bergson: if death is something rather than nothing, it must create something absolutely new – the cadaver, which is not another object but the first (time) image. This hypothesis indeed leads to something unexpected and unforeseen: the *secret* relation that links the cadaver-image to the cinema, whose cadaverous dimension has nothing to do with spectres and ghosts of shadows. The latter are only reflections of a more profound indebtedness to the cadaver as the first image, which image the cinema, if and when an act of pure creation, infinitely differentiates – repeats (remembers and recalls) again and again, otherwise.

In your letter, you find the 'thesis' (your term) regarding the cadaver too 'subtle', and the lessons learnt implicit, 'if not cryptic here and there'; you ask for a concluding section which would return to the interlocutor's provocation (why speak of life starting from death?), and perhaps more pressingly, explicitly address the enigmatic last essay, 'Immanence: a life'. You will forgive me if in this quest for explication I see a strange kinship with the translator's decision to omit the ellipsis from Deleuze's original title of the same essay: 'Immanence: une vie . . . '.

With one stroke, the omission eliminates the pragmatics of *suspension*, the *indefinition* that places the title at the limit of the un-sayable, converting it to a stammer. I hope you will see why a 'conclusion' would amount to a similar closure of an accomplished opening. First, the trajectory of the writing is not circular or even linear. Instead, the essay is structured as a montage of two discourses of unequal length that operate on discontinuous and heterogeneous planes. One discourse, not without justification, points in the direction where death is present on the reverse side of life in Deleuze's work. And reverse is not the same as the outside. The other transposes death to a wholly other plane. If I dare speak of a *theoretical* accomplishment here, it is only by reference to this translation opening to an altogether different question/questioning of death. On this second plane, the concerns of the first discourse (is death the limit against which life – benediction, salvation – needs to be thought?) are not invalidated. They simply fall away or rather cannot take place. Yet, with regards to the whole, these same questions continue to operate (insist) in and through the montage, which institutes a reciprocal interplay across the interval between the two planes.

If a montage is not a sum or summation but an opening, the question it begs for is, as Deleuze says: what passes in between? 'Qu'est-ce qui se passe "entre"?' (Deleuze 1990b: 165).

Notes

1. An early version of this essay was read at the conference 'Gilles Deleuze: Texts and Images', held at the University of South Carolina, 5–8 April 2007. It is dedicated to Constantin Boundas, who introduced me to the work of Deleuze and whose infinitely polite but persistent provocations have always showed me how to take one more step.
2. To my knowledge only René Schérer, more than a literary friend of Deleuze, dares to turn his gaze to this bloody spectacle to propose that only a *philosophical* reading of it is possible: 'On ne peut parler que *philosophiquement* [my emphasis] de la mort de Gilles Deleuze.' Significantly, he speaks not of a fall but of flight: 'il s'est *envolé*'; 'il a pris son *envol* dans une défenestration rare et sublime arrivant à s'égaler à l'événement de la mort . . . '. By offering this rare and sublime *image*, which recalls my reading above of Godard's reversal of Hamlet's leap into a soaring flight, Schérer takes the first step towards such a reading: an *a posteriori* affirmation of the act that *Logic of Sense* phrases as 'saying yes to death by the love of life' (Schérer 1998: 10).
3. For a discussion of this confrontation see Nancy 2003: 57–99.
4. 'Une image en appelle une autre, une image n'est jamais seule, contrairement à ce qu'on appelle "les images" aujourd'hui qui sont des ensembles de solitudes' (Godard 1998a: 173).
5. For a discussion of this fold see Nancy 1996: 107–13.

6. Under the same title 'The Two Versions of the Imaginary' there exist two different translations for this text, one by Ann Smock, the other by Lydia Davis, in *The Space of Literature* (1982) and *The Gaze of Orpheus* (1981), respectively. My translation borrows from and frequently modifies both.
7. Both existing translations destroy this ambiguity. One by Anne Smock: 'let us look again at this splendid being from which beauty streams: he is, I see this, perfectly like himself. The cadaver is its own image' (Blanchot 1982: 258). The other is by Lydia Davis: 'If we look at him again this splendid being who radiates beauty: he is, I can see, perfectly like himself; he resembles himself. The cadaver is its own image' (Blanchot 1981: 83).
8. 'We witness the birth of memory, as the function of the future which retains what happens in order to make it the object to come of the other memory' (Deleuze 1989: 32).
9. 'Réfléchissante et réfléchie', says Deleuze (1983: 125) of the close-up that facialises the object framed. But whereas the two aspects of this 'face' are reflective surfaces that open to the outside – make visible affects on both sides of the face, on its exterior and interior – the cadaver's redoubling is a closure: in resembling itself, it closes upon itself.
10. In truth, it is difficult to say when the remains (*dépouille*) ceases to be a cadaver. In the essay already cited, Cixous reminds me of this difficulty by way of another literary example, this time supplied by Stendhal's *Charterhouse of Parma*: 'Fabrice's horse stopped [here another animal encounters the cadaver] before *the border thing* [my emphasis], someone's cadaver or else body? Or else an alreadynolongerbody and notyetcadaver ? . . . Fabrice turned green at the sight not of the whole but of the part that still detained the indecisive being in human life: the filthiness of the feet' (Cixous 2007: 177). The dirty feet sticking out of the ground may be still cadaverous, even if the rest is already neutral, organic matter. But so is the amputated hand displayed as war trophy on the jeeps of ragtag soldiers in some African city – even though the person it once belonged to may still be alive.
11. 'The direct time-image is a phantom which has always haunted the cinema, but it took modern cinema to give a body to this phantom' (Deleuze 1989: 41).
12. For Barthes' meditation on the impossible time of the photograph, see his *Camera Lucida*. The photograph in question, taken at the end of the nineteenth century, shows a young man before his execution in his prison cell. Barthes captures the bifurcation of time that the photograph fixes for all future presents by the celebrated phrase: 'he is dead and he is going to die' (Barthes 1981: 95). See also my 'Toward a Memory of the Future: Cinema, Memory, History', forthcoming.
13. For further discussion on the cinema's temporalising see the following essays: 'A Fourth Repetition' (Baross 2006a), 'The Future of the Past: the Cinema' (Baross 2006b), 'The Future of Deleuze, an Incomplete Project' (Baross 2006c) and 'Toward a Memory of the Future', forthcoming.
14. See especially Derrida's long preamble to his 'severe' critique of *Folie et déraison*. The time it takes for Foucault to answer is perhaps an indication of the depth of the wound it delivers. Writing at once an apology and a confession, Derrida hesitates between being 'challenged, rejected and accused' and being the challenger himself; or between the 'consciousness of an admiring and faithful disciple' and an 'unhappy consciousness', and then again, between having a master and having only interiorised the master (Derrida 1978: 31–63).

Paris and its Doubles: Deleuze/Rivette

Garin Dowd Thames Valley University

Abstract

This essay sets out from the premise that the films of Jacques Rivette merit sustained reconsideration in the framework provided by Deleuze's *Cinema 2: The Time-Image*. In particular it explores the concepts of 'the powers of the false' and 'fabulation' as ways of engaging with Rivette's cinematic oeuvre, with a particular focus on his Paris-set films. On this basis the article seeks to add to the readings undertaken by Deleuze himself and, in the light of Rivette's cine-thinking, to examine in tandem both films to which Deleuze directly responded, such as *Le Pont du nord*, and later post-Deleuze renegotiations of the city such as *Secret défense*.

Keywords: Powers of the false, fabulation, the virtual, bifurcation, urban space, the time-image

In his early study of Nietzsche Deleuze asserts: 'our highest thoughts take falsehood into account; moreover, they never stop turning falsehood into a higher power, an affirmative and artistic power that is brought into effect, verified and becomes true in the work of art' (Deleuze 1983: 105). The second of Deleuze's two volumes devoted to cinema returns to the theme of the 'powers of the false' first introduced in *Nietzsche and Philosophy*. In *Cinema 2: The Time-Image* the emergence of the powers of the false is seen as symptomatic of the broader transformation which Deleuze associates with the break with the movement-image – that is with the precepts and modus operandi, not to mention the conceptual support-structure, of 'sensory-motor'-driven or organic cinematographic presentation. What this emergence seeks to displace is a cinematographic model dependent on a certain stance vis-à-vis representation, verisimilitude and realism. 'The space of a sensory-motor situation', *Cinema 2* informs us, 'is a setting which is already specified and presupposes an action which discloses it, or prompts a reaction which adapts to or modifies it' (Deleuze 1989: 7). Organised as it is by a vector of transcendence guaranteed to consolidate 'good form', organic

cinematographic presentation secretes what Deleuze calls chronological time. In chronological time, overseen by the 'sensory-motor situation', interventions which jar with the narrative presupposed by that situation are only capable of being viewed as 'contingently abnormal' (Deleuze 1989: 128). Organic cinema 'presupposes the independence of its object, and hence presupposes a discernibility of the real and the imaginary' (Deleuze 1989: 7). By contrast, the cinema which Deleuze identifies as 'crystalline' adopts strategies of representation which see it, like the *nouveau roman*, offer up descriptions which replace its own object. The object is erased but another reality is powerfully brought out in the act of constructing through speech or vision. In such a cinema the imaginary and the real become indiscernible (Deleuze 1989: 7).

Pascal Bonitzer, now one of the film director Jacques Rivette's regular collaborators as screenwriter, once recalled with amusement an article on the latter's *Céline et Julie vont en bateau* (1974) written under the influence of *Anti-Oedipus* which was rejected by the editors of *Cahiers du cinéma* because it was out of step with the Althusserian turn which the journal had taken in the early to mid 1970s (Bonitzer 1998: 50). His anecdote serves as an introduction to the present study. For the connection between the thought of Deleuze and the cinema of Rivette has emerged with some hesitation.[1] In the two volumes on cinema written by Deleuze, while there is no doubting the importance for him of Rivette, in his account of the adventures of the movement- and time-images in the twentieth century Rivette's work occupies at first glance a place more marginal than either that of Jean-Luc Godard or Alain Resnais (see Deleuze 1985: 213–14 and 1989: 10–12, 19, 76–7, 194).[2] Despite the fact that discussion of the work of Godard and Resnais respectively is considerably more substantial than the space devoted to Rivette, a detailed examination of the opening pages of the second volume nonetheless reveals just how central Rivette is to the subsequent elaboration of Deleuze's taxonomy.

The 'visionary aestheticism' of Visconti, the 'emptied spaces' of Antonioni which have 'absorbed characters and actions' (Deleuze 1989: 5), and the effacement of the 'distinction between the spectator and the spectacle' in Fellini are components emerging from the neo-realist tradition – all of which find themselves continued in Rivette. The trajectory of Deleuze's argument here is marked by an important and informative digression – the discussion of Robbe-Grillet in which Deleuze notes how the *nouveau roman* replaces its own object and fabricates through indirect speech and vision (Deleuze 1989: 7). It is to Robbe-Grillet that Deleuze will return in the key chapter as far the

present essay is concerned, 'The Powers of the False'. Deleuze subscribes to the view of André S. Labarthe that *L'année dernière à Marienbad* (1961), to which Robbe-Grillet contributed the scenario, is the last of the great neo-realist films. In this it forms for Deleuze the logical link between the Italian neo-realist tradition and the French *nouvelle vague*. As in *L'année dernière à Marienbad*, in Antonioni's films, from *L'Eclisse* (1962) onwards, the severance of character from territory means that what we encounter is emptied space 'occupied' or haunted by emptied character. '[T]his space refers back again to the lost gaze of the being who is absent from the world as much as from himself' (Deleuze 1989: 9). The gaze is adrift and dislocated, thus creating an optical drama lived by the character. In Robbe-Grillet's novel *Dans le labyrinthe* (1959) for example, in which an unnamed city is the location for a soldier repeatedly to encounter a child as they circulate in a 'quadrillage' of identical streets, the oneiric space flattens out in several self-reflexive devices such as the 'engraving generator', which is itself the source of the characters in the city (Robbe-Grillet 1983: 17), and the check tablecloth which in its gridding and interplay of chaos and order becomes just one of the novel's innumerable *mises-en-abyme*. 'On' this scene, 'in' this place, objects come into prominence only through their being covered, traced in their contours by an at once enveloping and revealing substance. They are absences which are pulled back into Being by means of being covered either by dust (if they are interior objects) or snow (if they are exterior objects). In coming into the zone of emergence the city and table are simultaneously and paradoxically buried. In articulating what he sees as the common ground between neo-realism and the *nouvelle vague*, for Deleuze there is in Rivette both a consolidation of several innovations with which the fiction of Robbe-Grillet is identified and a new set of departures. The two main film directors identified by Deleuze at this juncture are Godard and Rivette. Together with Jacques Tati they continue to create a cinema of optical and sound situations, as opposed to the cinema of action, or sensory-motor cinema.

Rivette is moreover identified by Deleuze as a filmmaker melded with his terrain, an inheritor of Nerval – a 'singer of Paris and its rustic streets' (Deleuze 1989: 11). It is not surprising to read this in the work of the philosopher who so admired Edith Piaf.[3] But Rivette's Paris is one which is often emptied (and in this respect unlike that depicted in one of Piaf's songs – 'La foule'), as if its population were exhausted by the actual characters, in the manner of Antonioni (*Paris nous appartient*, *La Bande des quatre*), or it is the launch-pad for hallucination (*Céline et*

Julie vont en bateau), experiments in reformulating and deconstructing the traditional heterosexual couple (*L'Amour fou*), or playful trans-genre exercises (*Haut bas fragile*), all united in their common recourse to a repertoire of 'fantasies, memories, or pseudo-memories . . . fable and children's games' (Deleuze 1989: 10).[4] The emptied terrain is occupied by a visionary character which does not coincide with itself, which, staring back at its emptied space, produces and perceives only pure optical and sound situations. Thus Deleuze writes of *Paris nous appartient* (1961) that 'the stroll culminates in a twilight fantasy where the cityscape has no reality or connections other than those given by our dream' (Deleuze 1989: 11). In other films Rivette is shown to compound the loss of circumscribed terrain by rendering unreliable the boundary between spectator and spectacle, both poles inhabiting the mirage itself, which in *Duelle* (1976) – the exemplar for Deleuze – takes the form of the two women of the spectacle proceeding to eliminate all witnesses to their cosmological conspiracy 'projecting an eternal mirage on to the earth' (Deleuze 1989: 11).[5]

I. The Powers of the False and Fabulation

The problem of the powers of the false is linked to the allied questions – also central to Deleuze's work more generally – of population and of territory (Deleuze 1987: 51). In particular, through their joint implication in the presiding concept of the time-image, for Deleuze both the notions of the powers of the false and of territory (itself resonant with the concept of territorialisation – not explicitly a concern in the cinema books) pertain to a modern conception of time which he describes as belonging to the specificity of the 'urban'.[6] For, although the concept of the powers of the false has a specific function in Deleuze's argument, it finds a complementary expression under the banner of another Deleuzian concept (this time derived from Bergson rather than Nietzsche) – fabulation. To fabulate is essentially linked by Deleuze with a political problem: 'the people are missing'. The latter notion is on the one hand historically specific (say, in the case of a postcolonial filmmaker – Senegalese director Ousmane Sembène, for instance), but on the other, functions as a conceptual placeholder to identify traits in films which, while less explicitly concerned with politics, experiment with modes of address, enunciation and representation such that fabulation is also concerned in both geopolitical and ontological terms with ground, with territory, with foundation and, ultimately, with the *effondrement* ('ungrounding') advocated at the close of *Difference and Repetition*

(Deleuze 1994: 292). Writing of ontological repetition there, Deleuze had suggested that:

> Perhaps the highest object of art is to bring into play simultaneously all these repetitions [physical, psychic, metaphysical, ontological], with their differences in kind and rhythm, their respective displacements and disguises, their divergences and decenterings, to embed them in one another and to envelop one or the other in illusions the effect of which varies in each case. (Deleuze 1994: 293)[7]

Fabulation, as the engine of the 'powers of the false', under certain conditions, is an undertaking which confronts thought with its own limit. In cinema it entails 'having a thought', *thinking otherwise*. What we encounter is, in Stephen Zepke's words, 'a creative will of cine-thought emerging in a new cinematic aesthetics' (Zepke 2005: 105). Unlike the philosophical model of error, which will measure transgressions in terms of their deviation from truth, considered as prior and as standard, the powers of the false entail an alliance which does not recognise truth or the truth–falsity distinction in the first place.

In the specific context of *Cinema 2* fabulation is exemplified, *inter alia*, by the work of Ousmane Sembène. This is why the *griot* is Sembène's way of figuring in *mise-en-abyme* the role of the film director. In foregrounding the *griot*'s function Sembène is able to show how stories have either been silenced or their context heavily contaminated, and how in this specifically postcolonial context it is necessary to create a counter-memory, to speak for the absent, to 'falsify' for those who will remain absent, and for those who never were (Deleuze 1989: 222). The cinema of Rivette of course, does not approach or embody fabulation in the same way or to the same ends as does the work of Sembène.[8] Nonetheless, in the conjunction of the theme of territory and the powers of the false, his oeuvre is marked by a mode of fabulation. Rivette's first full-length feature, *Paris nous appartient*, had already raised the question of a population and a territory (and their relation) in its very title. Later, *Le Pont du nord* (1981) articulates a conflict between very specific geographical coordinates (in a northern part of Paris in the nineteenth arrondissement around La Villette, then being massively redeveloped) and their modulation in the film's narrative within an imaginary global conspiracy.[9]

Other Paris-set films which embrace the typical Rivettian combination of plot and *complot*, in particular *Secret défense* (1998) and *Histoire de Marie et Julien* (2002), concern access to the hidden and buried layers of intrigue, the unravelling of which serves less to resolve than

to keep open a constitutive ambiguity. If, as Balint Kovács observes in an essay on Deleuze, 'the narrative principles of modern cinema consist in making possible the realisation of virtually existing suprasensible worlds' (Kovács 2000: 163), then Rivette is an important figure in this regard.

According to Deleuze part of the specificity of the work of Rivette is that it revisits the work of the pre-war French school (Grémillon, Epstein, Vigo, L'Herbier): 'I think expressionism conceives light in relation to darkness, and their relation is one of struggle. In the pre-war French school it's quite different: there's no struggle, but alteration; not only is light itself motion, but there are two alternating lights, solar and lunar' (Deleuze 1995: 49). In his essay published in *Cahiers du cinéma* on Rivette's film *La Bande des quatre* Deleuze develops this theme. The essay is organised as a taxonomy featuring three 'circles' – roles (theatre), attitudes and postures (life), and masks (conspiracy) – which are themselves enclosed in an encompassing circle. 'We are all rehearsing parts of which we are as yet unaware (our roles). We slip into characters which we do not master (our attitudes and postures). We serve a conspiracy of which we are completely oblivious (our masks). This is Rivette's vision of the world (Three Circles)' (Deleuze 2006: 256). Deleuze extrapolates from this to provide an account of Rivette's entire oeuvre based on the ideas of modulation, transformation and intersection: 'In a certain way, Rivette has never filmed anything else but light and its lunar (Lucia) and solar (Constance) transformations. Lucia and Constance are not persons, but forces' (Deleuze 2006: 258).[10] Through its interplay of two lights and two women, solar and lunar, *Duelle* (the earlier film) had already in Deleuze's assessment marked a return to concerns associated with the pre-war French school.[11] The struggle between characters associated with these lights is conducted in a shifting terrain which disrupts any dialectical confrontation. In place of dialectical opposition, Rivette presents a world marked by divergent series which are 'endlessly tracing bifurcating paths' (Deleuze 1993: 81), or by cuts and interstices which might be said powerfully to exemplify that aspect of modern cinema which for Deleuze is concerned, in Zepke's words, with 'the interstice of images . . . Indiscernibly virtual and actual, their actual individuation emerges from the virtual' (Zepke 2005: 115).

In this respect there is a fundamental disagreement between the approaches of Deleuze and of Jacques Rancière to cinematographic modernism. In contrast to Deleuze, who views the sensory-motor schema as producing effects of totalisation, narrative coherence and the solace of good form, Rancière proposes that all cinema, and not just the

particular directors favoured by Deleuze, is founded upon what he calls a 'thwarted fable'. Accounts such as the one Deleuze provides of Rivette would be examples of Deleuze's quest for a 'dramaturgy of ontological restitution' (Rancière 2006: 5) which Rancière finds to be contradictory, based as it is on extracting from film narratives (such as Hitchcock's *Rear Window*) allegories of the rupture with sensory-motor schema (such as the immobility of Jeff/James Stewart). It is beyond the scope of this essay to engage in this debate further than simply to note that Rancière restores a dialectical imperative which Deleuze would resist. For Rancière *opsis* (emergent and accidental visions) runs against the grain of *muthos* (enabling narrative), and this is for Rancière the *thwarted fable* (Rancière 2006) This is quite distinct from Deleuze's bifurcating paths, wherein the act of fabulation is implicated in a pervasive virtuality, even if both philosophers find in cinema an allegory for a politics which features the idea of what Rancière describes as a 'surging-forth from the shadows'.

II. Bifurcation, Folding, Fabulation

In Jorge Luis-Borges' renowned tale 'The Garden of Forking Paths' two competing impulses can be discerned: on the one hand there is a disposition towards encompassment and synthesis, and on the other, one towards divergence and bifurcation. Deleuze's brief reading of Borges' tale as put forward in *The Fold: Leibniz and the Baroque* (it is also referred to in *Cinema 2*), positions the text as a neo-baroque reworking of the 'Baroque' philosopher Leibniz's theory of possible worlds (Deleuze 1993: 62). Deleuze's conceptualisation of what he calls the neo-baroque, with its emphasis on folding, has the merit of what has been described by one commentator as 'complicity with the world . . . a thought of inflexion and fluidity, of a geometry regulated by rapports more than by distances' (le Dantec 1992: 140). In addition one of the most notable aspects of Deleuze's concept of the fold is the specific model of virtuality which it entails.[12] Deleuze takes from Leibniz a theory of virtuality which he returns from the brink of dogmatic closure to which the author of the *Monadology* is committed. Reading Leibniz somewhat against himself, Deleuzian virtuality, in the form of possible worlds, does not, as it does in Leibniz, work in such a way as to shore up the actual, the state of things. John Rajchman's succinct summary of the difference between Leibniz's possible and Deleuze's virtual will serve our purposes here: ' "Virtuality" is not the "possibility" of something that might be "realised"; it is already real, and it does not stand in a representational

or mimetic relation to what "actualises" it' (Rajchman 1998: 125). In Leibniz's *Monadology* each individual monad is the intellectual mirror of the entirety of existence. Each, to a degree peculiar to it and dependent on the force at its disposal (its position in a hierarchy of beings lends the monad its force), is said to 'express' the entire universe (Leibniz 1991: 25). In Leibniz's scheme the virtual designates that part of a given monad which houses the unconscious expression of the universe. It also includes under its jurisdiction worlds which are said to be possible. However, in Leibniz any discordance between possible worlds is ruled out by recourse to an overriding principle which declares that worlds which are incompossible with pre-established Divine harmony only have a contingent status. The virtual of possible worlds shores up the actual of this world.

What is ruled out, however, in the neo-baroque (Deleuzian) version of the possible world is the harmonic modulation of the fold by means of which the subject (the Leibnizian monad) is formed. Instead of a divergent world wherein the election was between the compossible and the incompossible (with the compossible winning out in Leibniz), we witness an inclusive disjunction, a bifurcation: the incompossible is not simply rejected but becomes, instead, constitutive of the subject. In the work of certain directors – Rivette, Raúl Ruiz and Werner Schroeter most notably – we encounter what amounts to an elaboration of a thinking of incompossibility first formulated in Leibniz.

Fabulation, as Deleuze understands it, is another way of thinking through the virtual once it is returned from the threshold to which Leibniz takes it. Fabulation is a speech/enunciative act (conceived in the most general terms) which can engender a people (it cannot realise that people, but it can summon it forth in germinal or viral form). '(A)s Bergson was able to see, fabulation – the fabulating function – does not consist in imagining or projecting an ego. Rather, it attains these visions, it raises itself to these becomings and powers' (Deleuze 1998: 3).[13] Fabulation, then, summons a protean, virtual people which always retains a germinal status and never acquires the status of Being. 'The people' as a collective is not actualised in a state of things but retains a virtual status in the specific sense in which Deleuze understands virtuality. This people is not prepared for, nothing pre-exists, no script is written which will accommodate it to us. Fabulation is also 'free indirect discourse' wherein it will be impossible to disentangle the contributing and constitutive voices one from the other. Rivette's work, especially of the more emphatically experimental phase, is attuned to this consequence of fabulating utterance. On the one hand this is

true in so far as collaborative collective utterance – through Rivette's frequent work on scenarios with his cast – is made possible through the circumstances of filming.[14] The director as filmmaking subject is not a unity but a multiplicity traversed by forces and vectors of becoming. Writing of Blanchot in terms which equally apply to Rivette, Deleuze refers to 'the presence to infinity of another thinker in the thinker, who shatters every monologue of the thinking self' (Deleuze 1989: 168).

In order to register the intensity of fabulation, rather than neutralise it in the name of intentionality and the ego, Deleuze argues that what is required is the 'intercesseur': 'Creation's all about mediators . . . Whether they're real or imaginary, animate or inanimate, you have to form your mediators. It's a series. If you're not in some series, even a completely imaginary one, you're lost . . . you're always working in a group, even when you seem to be on your own' (Deleuze 1995: 125). The mediators Rivette seeks out are on the one hand his intertextual points of reference. These include references arising from direct adaptation. *Out 1: Noli me tangere* (1970–71) is loosely derived from Balzac's *L'Histoire des treize*, *Noroît* (1976) is based on Tourneur's *The Revenger's Tragedy* (1608), *Hurlevent* (1985) on the first few chapters of Brontë's *Wuthering Heights*, while *La Belle noiseuse* (1990) is adapted loosely from Balzac's 'Le Chef-d'oeuvre inconnu'. Other intertextual elements are summoned in the shape of works of theatre, literature and film, for example Racine's *Andromache* in *L'Amour fou* (1969), Henry James' 'The Other House' and 'A Romance of Certain Old Clothes' in *Céline et Julie*, Pirandello's *As You Desire Me* in *Va Savoir* (2001), Brisseau's film *Un jeu brutal* in *La Bande des quatre* (1989). In addition mediation comes in the form of his collaborators: Bulle Ogier, Juliet Berto, Jean-Pierre Léaud, Pascal Bonitzer, et al. These mediators then designate certain of the 'kinetic populations' which traverse the Rivettian oeuvre, equivalent to the mediators Deleuze describes as operative in his own work: 'What mattered was not the points [. . . which. . .] functioned simply as temporary, transitory and evanescent points of subjectivation – but the collection of bifurcating, divergent and muddled lines which constituted . . . a multiplicity and which passed between the points, carrying them along without ever going from one to the other' (Deleuze and Parnet 1987: ix).[15]

III. Relation, Belonging and Non-derived Images

Deleuze's claim – made at the mid-point (to date) in Rivette's career – that the director was 'the singer of Paris' (Deleuze 1989: 11)

in the tradition of Gérard de Nerval has been upheld by his output. From *Paris nous appartient* (1961) to *Histoire de Marie et Julien* (2003), roughly half of Rivette's output is set (or partly set in the case of *Secret défense*) in Paris. What one might call 'the problem of Paris' is articulated in the paradox which Rivette takes from Charles Péguy and which appears on screen in his first feature film: Paris belongs to us and Paris belongs to no one. This for Deleuze is an essential characteristic of the new type of character required by the cinema of the time-image: 'It is because what happens to them does not belong to them and only half-concerns them, because they know how to extract from the event the part that cannot be reduced to what happens: that part of the inexhaustible possibility that constitutes the unbearable, the intolerable, the visionary's part' (Deleuze 1989: 19–20).

The question of belonging also gives rise to that of attribution. By asking in his very first feature film the question which destabilises the attribution of Paris, which disorients it, uncouples it, Rivette poses the problem of both the dispossessed people and the dislocated city. He poses in his own medium the question at the heart of Deleuze's conception of the time-image: to whom is the image to be attributed? Maurizio Grande, in his own Deleuzian analysis, has classified the status of the image in Rivette in terms of 'images non-dérivées' (Grande 1997: 297). The world, in Rivette's vision, becomes an enormous hallucination, to which, or within which, a stable enunciative subject and/or object cannot be appended or isolated. In his response to *Noroît* following its only theatrical screening in 1976, Jonathan Rosenbaum points out how, like *Duelle*, it is structured 'on the successive elimination of every character, developing towards a confrontation between a moon ghost and a sun fairy' (Rosenbaum 1983: 162). Thus the magic sweets in *Céline et Julie vont en bateau* elicit the world of the family romance, fabulation, the birth of a possible world. But we never simply accompany these characters the better to return with them. For we will not return: the *dérive* causes the baseline to alter, to alter for all time and to always-in-advance have altered. Film, character and scenario each take off on a transversal trajectory which by definition rules out a return to the point of departure. As Coureau explains, 'Le cinéma de Rivette propose bien une géographie faite d'instables et précaires tentatives d'installation au sein de territoires' ('Rivette's cinema proposes a geography made of unstable and precarious attempts at installation in the heart of territories') (Coureau 1998: 51). In the words of Guattari, character and terrain in Rivette would be examples of ontological threshold crossing: 'I have crossed a threshold of consistency. Before the hold of this

block of sensation, this nucleus of partial subjectivation, everything was dull, beyond it, I am no longer as I was before, I am swept away by a becoming other, carried beyond my familiar existential Territories' (Guattari 1995: 93). 'Paris' for Rivette is the occasion for and ground of such a territorial fabulation.

This point can be illustrated by considering the status of urban wandering in *Le Pont du nord*, the film which occupies the same position in Rivette's career as *Passion* does for Godard: that of provisional summary (Deleuze 1989: 10). The film appears at the end of those *années* Giscard Rivette so abhorred. What happens to the characters of *Le Pont du nord* does not belong to them. The two central characters (played by mother and daughter Bulle and Pascale Ogier) attempt to unravel a labyrinthine thread inherited from Cervantes – the coordinates and vectors to which they respond deriving loosely from the trials of Don Quixote. But the foray undertaken here is one into a world where the so-called 'Maxes' (a clandestine movement with unspecified political motives) wreak havoc. The quest undertaken by the duo is dominated not by the line leading from beginning of quest (a problem posed to which the endeavours of the characters respond) to resolution of difficulty (or failure to resolve it), but by a continuum of branchings, graftings and bifurcations. For Lauren Sedofsky *Out 1: Spectre* (the short version of the 12-hour-plus *Out 1: Noli me tangere*) had already established this:

> it proposes to the spectator a plural vision ... thoroughly independent cuttings of reality. To this extent Rivette participates in a contemporary acceptance of phenomenological incompleteness. In *Spectre* he works actively against all totalizing principles, including his own, thereby dissolving the plot (understood as conspiracy and narrative). (Sedofsky 1974: 19)

The problem posed to the characters, as so often (and arguably always) in Rivette is one of representation: the map which they use to accompany, trace and establish their itinerary is the equivalent of Mallarmé's throw of dice which cannot abolish chance. The problem of representation is carried along by the film, inserting itself at each moment. Thus, at one point, the protagonists are found suspended, trapped in a labyrinth or spider's web of their own making. The film unfolds, then, according to a neo-baroque logic of the event. Subject and object are lost in the folds, the characters becoming 'nothing other than these optical haloes that are drawn at the intersection of the radii of curvature that fold the surface of images' (Cache 1995: 3). Towards

the end of the film a 'Max' exchanges martial arts kicks with Baptiste (Pascale Ogier).

Within a classic narrative denouement – quest, evasion, confrontation – the presence of the antagonists in the same frame suggests the convention of a conflict bringing to potential conclusion the problematic posed by the film up to and including this point. But within this moment of framing another frame intervenes. As the frame which accompanies our viewing of the film is traversed by celluloid and is veering towards resolution (i.e. the end of the film approaches), it is transgressed and multiplied by the emergence of the 'crystalline' effect of another frame (a viewfinder). In the second frame, or in the partition of the moment, the viewer sees, simultaneously, the Max and Baptiste engaged in combat and one actor (playing a Max in the film) and another (Ogier) practising the moves to be employed in that (simulated) sequence. Not one after another, or even alongside one another: to what is at work here one cannot respond 'now we see that it has been a film within a film all along'. The moment and the partition of that moment (the frame and the deframing) are given contemporaneously and disjunctively. While this rehearsal is not theatrical rehearsal – a concern in several other films by Rivette – it nonetheless performs here a related function to theatrical rehearsal, which, in the hands of Rivette, offers a paradoxical index of what cinema cannot itself achieve: the inscription of the contingent in every repetition. In the performances of Pirandello in *Va Savoir*, for example, external contingencies determine elements of the performance every night. The performance in the space behind the proscenium arch differs depending on who is in the audience and visible to the actress. Cinema screening, by contrast, is always repeated as the same. Ménil's claim that the theatre (including the idea of rehearsal in particular) of Rivettian cinema exists only as a function of a strictly speaking cinematographic project (Ménil 1998: 67) is all the more evident in *Le Pont du nord*.

In ending with this conjoining of rehearsal and filming *Le Pont du nord* operates a paradoxical closure and opening, script (plot) and conspiracy (*complot*) given together in what Deleuze would call an inclusive disjunction. For Deleuze this is an example of the crystal image, made possible by the break with the modus operandi of classical cinema: 'The crystal-image is, then, the point of indiscernibility of the two distinct images, the actual and the virtual, while what we see in the crystal is time itself, a bit of time in a pure state' (Deleuze 1989: 82). As Youssef Ishaghpour writes of the ending: 'La fin du *Le Pont du nord* est comme le chiffre du cinéma de Rivette: La fiction donnée

comme fiction devant la caméra' ('The end of *Le Pont du nord* is like the key to Rivette's cinema: Fiction given as fiction in front of the camera') (Ishaghpour 1986: 211).

Within the space constructed in Rivette's films one is concerned less with a spent time which can be exchanged and cancelled in favour of closure and resolution than with *durée* itself. His films seem apt illustrations of Deleuze's discussion:

> The universe is made up of modifications, disturbances, changes of tension and of energy, and nothing else. Bergson does indeed speak of a plurality of rhythms of duration; but in this context he makes it clear – in relation to durations that are more or less slow or fast – that each duration is an absolute, and that each rhythm is itself a duration. (Deleuze 1988: 76)

This is borne out in *La Bande des quatre* which divides its scenes by means of shots of metro trains serving as blocks of sonic and visual affect. They intervene; they are between scenes, at once cutting across and conjoining. Theirs is a trajectory separated from departure or destination; they are intermediate states of dislocation and dis-locution.

As Deleuze writes, apropos Leibniz's *Monadology*, ultimately, despite the conservative intentions of its author, it concerns 'a world of captures rather than of closures' (Deleuze 1993: 81). In the films of Rivette it can be argued that one witnesses molecular conspiracy (capture) staged as the subversion of a global encompassing molar conspiracy (closure). Jonathan Rosenbaum attributes the Lang influence, with its strong theme of conspiracy, which returns with considerable force in *Secret défense*, to the long-standing admiration inaugurated in Rivette's 1957 review of *Beyond a Reasonable Doubt* for *Cahiers du cinéma* (Rosenbaum 1983: 165). For some commentators this theme is synonymous with an integral aspect of modernity. As Hélène Frappat points out however: '[L]a modernité consiste à inventer des complots d'ou toute intention a disparu' ('Modernity consists in inventing conspiracies from which all intention has disappeared') (Frappat 2001: 213). It is the fact that in his presentation of conspiracies, in *Paris nous appartient* and *Le Pont du nord* for example, there seems to be both a lack of any intent on the part of the conspirators as well as a lack of any human intentionality to ground and sustain them, that makes Rivette's most pervasive genre 'coordinate' so lacking in anchorage. In place of this Rivette creates what has been called a 'cosmological' perspective on conspiracy. In seeming to locate itself upon this genre coordinate Rivette's oeuvre indicates all the more its slippage from all coordinates, including those imposed upon it in the name of interpretation. In place of resolution or of Hegelian

sublation, what Rivette films is usually a crystalline moment, one of coalescence and rapport; capture, provisional enclosure with the crystal of time (just as the duo from *Le Pont du nord* are enclosed in the spider's web).[16] Thus the film-within-a-film sequence in *Le Pont du nord*; thus the doubles which proliferate in many of the works but especially in *Duelle* and *La Bande des quatres*, or even the double painting and erasure which forms the axis of *La Belle Noiseuse*; thus also the repetition, in the form of a reverse mirror image, in *Céline et Julie vont en bateau*. The equivalent of the crystalline merger of the virtual and the actual, in Rivette one is left in the throes of an inexhaustible possibility – incompossibility rather than a conclusion. This, arguably, is the Hawksian side of Rivette.

If, then, the site to which either character or theme would be adhered does not serve in fact to locate or consolidate either then both are left adrift, dislocated and in abeyance. Which is why so many Rivette protagonists are always *en route* (Baptiste in *Le Pont du nord*, circling on a moped the statue of the lion in the *place* Denfert) and often found at dawn, on the threshold of day and night, life and death.

It is this insistence, first on place – the streets of Paris, and then on characters-actors who cannot *belong*, that provides the shifting territory of the 'fabulist'. Paris for Rivette is a garden of bifurcating paths. The scene in *Secret défense* where Sandrine Bonnaire's character crosses Paris and journeys to the estate in the country by various modes of public transport – a particular fascination of the director – comprises three long takes. Antoine de Baecque in an otherwise quite acerbic article representing a strong statement on the alleged irrelevance of this manifestation of the 'Rivette system' to contemporary French cinema, writes eloquently of this scene: 'Time, then, dilates, the body see-saws with deliberation, hastening from train to train, from speed to speed; the world is ceaselessly sucked in by the fantastic and the irrational; everything flows (liquids play an important role in the film) and nothing can settle until death is achieved' (de Baecque 1998: 71). The scene reveals several aspects of Rivette's singular project. First there is a concern with vectors, second with duration, Bergsonian *durée*, but third it reminds us of Rivette's approach to his actors.

As a director Rivette is notable for the extent to which he has attempted to theorise film acting. In an interview he refers to his attempts to 'treat the text as material which plays a role exactly similar to the other materials in the film: the actors' faces, their gestures, the photographic texture . . . the words carried by the images are not filmed

for their meaning but rather for their materiality, as events and not as meanings' (Rivette [1973] in Rosenbaum 1977: 52).

In interview with Serge Daney in the film *Le Veilleur* (directed by Claire Denis), Rivette reveals what it is that fascinates him about actors such as Jean-Pierre Léaud. They manage, he argues, to act with their entire bodies. This is why Rivette cannot restrict the actor's body to close-ups of the 'privileged part of the fragmented body, the face' (as he explains in the film). He needs to have the entire body, not the signifying, metonymic fragment. Rivette's cinema requires a specific type of actor as well as a new approach to them as co-creators. Bulle Ogier and Juliet Berto created their own roles through part improvisation and writing – in films in which, as has been said of *Out 1*, good and bad acting ceased to matter, what was at stake being 'behaviours' Geraldine Chaplin described to Jonathan Rosenbaum the rigours of working with Rivette on *Noroît*, while recently in an interview on the DVD release of *Histoire de Marie et Julien* Emmanuelle Béart describes the particular challenges working with him continues to present to actors. His approach has counterparts in cinema and of course theatre. While the experimental fervour of the post-1968 era which characterises his work in the 1970s may no longer be in evidence, there remain, in films such as *Haut bas fragile* (1995) and *Va Savoir*, in different ways and to different degrees, elements deriving from the period. Sedofsky's account retains its force: 'Like Artaud, Rivette has created a "non-theological space" (Derrida) which admits the tyranny of neither text nor auteur. It is a space in which the actor's grammar of gesture and voice may play creatively, without impediment' (Sedofsky 1974: 19).

IV. *Secret défense*

Sandrine Bonnaire's portrayal of detachment from the socius had already been deployed to great effect in Agnès Varda's *Sans toit ni loi* (1985) and Claude Chabrol's *La Cérémonie* (1995) when Rivette developed her character for *Secret défense*. Her character Sylvie is only partly participatory in the world of human exchange, interacting with humans only at the level of DNA as she conducts her research – interaction with the molecular DNA as opposed to molar human subjects (Deleuze and Guattari 1988: 345). The only other interaction with anyone outside her family takes place in commercial situations (or states of transit), buying a ticket or a drink to steady her nerves en route to Walser (Jerzy Radziwilowicz) at the estate. Sylvie exists only as

a force of intervention, refusing relation, and inhabits what Deleuze calls 'vectorial' as opposed to 'encompassing' space (Deleuze 1985: 218). She perpetuates a question, sends a vector into the estate, and threatens to unearth its buried secret. Indeed, as the scene from which the film gets its title demonstrates (as Sylvie walks past the sealed room where missiles are being constructed Walser jokingly whispers 'Secret Défense!' – Top Secret), we are reminded that the secret has a kind of radioactivity: 'It is as if the past surfaces in itself but in the shape of personalities which are independent, alienated, off-balance, in some sense embryonic, strangely active fossils, radioactive, inexplicable in the present where they surface, and all the more harmful and autonomous. Not recollections but hallucination' (Deleuze 1989: 113).

At work in her Parisian laboratory Sylvie is attempting to find a 'cure' for cancer. The cure however must 'kill' the cancerous cells, as the scene in which she observes the promising results of an experiment makes clear. Likewise, in her view and that of her brother, to cure the malaise that stalks and unsettles their present requires the death of Walser, their father's former associate. The photograph uncovered by Sylvie's brother sets Sylvie off on a path leading towards Walser, as assassin of their father and supplanter of the latter both in their mother's affections and in the role of company head. However, as she sets off on this trajectory, the contact which takes place with him initiates another path, incompossible with the first: Walser as avenging the suicide of the younger sister after the sexual abuse suffered at the hands of the murdered father. Time, here, is off its hinges: the original and suspended sorority is repeated in the two local sisters, both of whom sleep with Walser. But the murdering Walser's role is accidentally now occupied by Sylvie; beginning with the intention of revenge, she replicates Walser's own earlier murderous act, but misdirects her own vector of intervention: as Sylvie holds a gun to Walser not believing his account, Walser's young lover intervenes only to be accidentally shot as she struggles to defend him. The two surviving sisters eventually confront each other, the local woman deliberately shooting Sylvie in what she regards as revenge for her own sister's death. The goal to which each character is directed – is vectorially disposed – is to be reached by means of a killing and yet in killing in each case one fails to reach that goal. Each occasion, then, is a 'false' death, comes about as the result of a wrong move, one brought about by the intervention of the incompossible, the impossible. What happens to Sylvie does not belong to her.

Deleuze says of theatrical representation in Rivette that it 'is a mirror-image but, precisely because it is constantly failing, is the seed of that which does not manage to come to completion or to be reflected' (Deleuze 1989: 76). Theatricality in *Secret défense* is somewhat distinct from the literal theatrical doublings of *Céline et Julie vont en bateau*, *L'Amour fou*, or *La Bande des quatre*, and from the painter–model frontality of *La Belle Noiseuse* (which is a kind of bridge in this respect taking us from the latter films to *Secret défense*), but it is present in the form of the stand-in at different levels: two sisters, Ludivine and Véronique, are played by the same actor (Laure Marsac), Sylvie acts in the place of her brother, Walser acts in a paternal role towards Sylvie, Walser and Sylvie's mother together play out a scenario extending over 15 years, within which he plays the role of faithful lover. None of these roles is allowed to be completed: each collapses in its own failure to represent, to render actual the virtual. 'Only the breakdown in artifice, the deconstruction of the plot, can identify the film as fabulation' (Sedofsky 1974: 19), or as Rivette himself says of the films up until and including *Céline et Julie vont en bateau*: 'In each case there was a first part where we assembled a story of a search, and a second part where little by little we wiped it out' (Rivette 1974: 23).

If Rivette's work attests to possible worlds in their bifurcation, inclusive disjunction and becoming, and if in this respect it maintains itself as generative locus of incompossible series without resolution, then it is in this sense that his work provides an emblem of a people to come, in Deleuze's sense. 'The people' does not designate a collective of individuals bound together in the imagined community of a nation. Instead of being an imagined community, the people to come, progeny of fabulation, is both the object and subject of a collective utterance.

For Jean-François Lyotard, in the megalopolis there is 'only transit, transfer, translation and difference. It is not the house passing away, like a mobile home or the shepherd's hut, it is in passing that we dwell' (Lyotard 1991: 198). Paul Virilio's neologism, *trajectif*, is helpful here (Virilio 1996). That which is trajective is to be distinguished both from the subjective and the objective. It collapses the binary distinction between these terms. In many respects the work of Rivette obeys a trajective logic: it does not have a centre, because within any posited centre we encounter a series of doubles ('Paris and its doubles').[17] This imposition of a labyrinthine imperative deprives his films of fixed coordinates, those which permit the identification and differentiation of subject and object. The viewer, once deprived of these coordinates,

is presented instead with a collection of vectors and trajectories in a cinematographic *dislocation*.[18]

The films of Jacques Rivette respond to the distinct velocity of the contemporary world, to its altered density. He – and Virilio might agree – is one of those who have invented a system of divergence, of decoy, at the threshold of dubious consistencies and subject positions (Virilio 1996: 25). In Deleuzian terms, to adapt Claire Colebrook, 'from the thought of the constitution of this or that space from this or that desire, one can think space as such in its infinite divergence: a thousand plateaus' (Colebrook 2005: 205). The work of Rivette has, for more than half a century, generated many molecular populations. Through the medium of a cinema predominantly located in the city, the space of the people, but also of the state and of the state apparatuses, Rivette has continuously invented collective assemblages of the type advocated by Deleuze, for whom 'The utterance is the product of an assemblage – which is always collective, which brings into play within us and outside us populations, multiplicities, territories, becomings, affects, events' (Deleuze and Parnet 1987: 51).

The practical political impact of a cine-thinking such as that of Rivette is not to be measured in the light of any discernible transformations which it manages to effectuate through influence upon a mass of people as such. Rather it is to be measured in the extent to which it stages levels of becoming (Deleuze 1998: 1) and trajective possibilities which do not belong to a molar model of liberation (arguably still the case with Rancière in his notion of the division of the sensible), but which, rather, function at a molecular level and engage with the *socius* at that level. Such lines of flight are dramatised in a filmic space which is also that of thought itself, as Deleuze says in *Dialogues* – cinematic thought, cinematic relation. In detecting the forces of resistance which can make power bend, 'the virtual is an opening for this combat, for this struggle of thought and of language against that which, in thought and in language, is at the same time power and servitude' (Parente 1998: 564). Deleuze's description of *Le Pont du nord* focuses on one side of Rivette – the molar conspiracy 'which distributes roles and situations in a malevolent game of snakes and ladders' (Deleuze 1989: 214) – whereas in *Secret défense*, with global power structures 'occluded' under the false immunity named in the film's title, at a molecular level another conspiracy – 'a collision of love or hatred' (Deleuze and Parnet 1987: 52) – is at work. It is the role of such an aesthetic problematisation of the contemporary to be, in Deleuze's and in Nietzsche's terms, untimely – that is, a critique of the

present world. For Rivette, it is apparent, as it is for Deleuze, that 'Time out of joint' is 'the time of the city and nothing else' (Deleuze 1998: 28).

Notes

1. Considering that Deleuze devoted an essay to the director, Anglophone commentary on Deleuze's writings on cinema has to date been relatively silent with regard to Rivette. In a French context, perhaps not surprisingly, there have been more frequent critical conjunctions (see for example Chauderlot 2001, Coreau 1998 and Ménil 1998).
2. Deleuze's 1989 *Cahiers* essay on Rivette's *La Bande des quatre* (1988) provides confirmation of the importance of the director to his understanding of cinema (see Deleuze 2006).
3. The admiration is emphasised in *L'abécédaire de Gilles Deleuze*.
4. Of course several of these films were made after the completion of Deleuze's book.
5. Rivette had the cast watch Mark Robson's Val Lewton-produced *The Seventh Victim* (1944), a film concerning the elimination of traitors and witnesses in a narrative about devil worship in Manhattan's East Village.
6. See Alliez (1996b: preface by Deleuze) on 'conducts of time', with Kant, for example, as 'the first *philosopher* of cities' (Alliez 1996a: 231) and Stengers (1997: 177–212) on the clock and the development of urban time.
7. At the end of the paragraph (Deleuze 1994: 294) Deleuze indicates the extent to which his thinking about this matter was already turning towards cinema (*L'année dernière à Marienbad* in particular).
8. Deleuze's emphasis on other aspects of Rivette is such that he is not mentioned in the 'Powers of the False' chapter.
9. On conspiracy see Watts (2005).
10. The essay revisits concepts developed in *Cinema 2* which was written before *La bande des quatre* was released. 'The attitude of the body is like a time-image, the one which puts the before and after in the body, the series of time; but the gest is already a different time-image, the order or organisation of time, the simultaneity of its peaks, the coexistence of its sheets' (Deleuze 1989: 195). Rivette there is one of the directors discussed in the context of the Brechtian idea of the 'gest [as] the development of attitudes themselves . . . a direct theatricalisation of bodies . . . independently of any role' (Deleuze 1989: 192). The film takes further the ideas developed in the films Deleuze does discuss, namely *L'amour par terre* and *L'amour fou* (Deleuze 1989: 193–4).
11. *Duelle* is a film which subsequent relative inaccessibility has rendered more peripheral in Rivette commentary than Deleuze might have imagined at the time he was writing. The fate of *Noroît* and *Merry Go Round* rendered them even less accessible (until its release on DVD in 2006, *Noroît* had only received isolated festival screenings since its completion in 1976).
12. Deleuze's theory of virtuality traverses much of his work. The crucial distinction between the virtual and the possible however appears in Deleuze (1988: 96–103).
13. 'Utopia isn't the right concept: it's more a question of a "fabulation" ' (Deleuze 1995: 174). He goes on to reiterate the assertion that we ought to take up Bergson's concept and make it political. Zepke suggests that 'the artistic power

of the false marks Deleuze's creation of the indiscernibility of Bergson and Nietzsche' (Zepke 2005: 106).
14. The collaborators multiply in *Haut bas fragile* with seven individuals listed.
15. On kinetic populations see Deleuze (1994: 216–7).
16. For Deleuze, Eisenstein is cinema's Hegel (Raessens 1997: 270).
17. 'Paris and its doubles' is one of the three titles which appear at the start of *Out 1: Spectre*, the four-hour refashioning of Rivette's 12-hour *Out 1: Noli me tangere*.
18. See Benoît Goetz (2002).

From Negation to Disjunction in a World of Simulacra: Deleuze and Melanie Klein[1]

Nathan Widder Royal Holloway, University of London

Abstract

This paper will articulate an underappreciated side of the psychoanalytical Deleuze: his relation to Melanie Klein, particularly as it appears in *The Logic of Sense*. Deleuze's engagement with Klein largely follows his familiar strategy of re-reading a thinker off of a twist in one or two of that thinker's key concepts. With Klein, this twist involves re-reading her story of psychic development on the basis of disjunction rather than negation, so that the psychic surface that emerges generates a persistent non-correspondence between self and other and between concept and thing. Deleuze thereby makes Klein a central figure in his ontology of sense and his analysis of how the physical surface of bodies generates a metaphysical surface of thought. However, Deleuze's ultimate turn is a Nietzschean one towards overcoming, the thought of eternal return, and the demolition of the Oedipal Law. As this final turn makes clear, even in his early writings that engaged more directly and affirmatively with psychoanalytical thought, Deleuze was already on an anti-Oedipal path.

Keywords: Gilles Deleuze, Slavoj Žižek, Melanie Klein, ontology, psychoanalysis, Oedipus complex

In a very strange book that is purportedly concerned with Deleuze's thought yet devotes at best 20 per cent of its pages to it, Slavoj Žižek proclaims his intention to carry out a '*Hegelian buggery of Deleuze*' (Žižek 2004: 48), which he later modifies to a 'Freudo-Lacanian buggery' (81). For Žižek, this means showing how Deleuze has an unacknowledged proximity to and reliance on the very thinkers he seems to caricature and oppose the most. To this end, Žižek focuses on *The Logic of Sense*, which he considers to be Deleuze's most Lacanian work. Noting Lacan's own approval of the text, he proclaims an identity between Deleuze's 'quasi cause' and Lacan's *objet petit a* (27) and, oddly

enough, also declares the 'quasi cause' to be Deleuze's 'name for the Lacanian "phallic signifier"' (83). Žižek maintains that this thesis 'goes "against the current"' (xi) because the Deleuze who is 'much closer to psychoanalysis and Hegel' (xi) has been obscured by the dominant popular image that defines him primarily through his collaborative works with Guattari.

According to Žižek, Deleuze was already struggling in *The Logic of Sense* with a commitment to two opposing logics embedded in his ontology of the virtual: on the one hand, the virtual is a surface effect of actual physical processes; on the other hand, it is the productive foundation of the actual (Žižek 2004: 20–1).[2] Both logics conform to the idea of the virtual as a sense that exceeds linear physical causality and representation, but the second 'comes dangerously close to "empiriocriticist" formulas: the primordial fact is the pure flow of experience, attributable to no subject, neither subjective nor objective – subject and object are, as all fixed entities, just secondary "coagulations" of this flow' (22). The logic of production thus leads to the vitalist ontology often associated with Deleuze; however, this vitalism, far from being a form of materialism, is really 'a *post-metaphysical idealism*' (24; see also 22–6). The other logic leads to genuine dialectical materialism, which alone 'can effectively *think* the "immaterial" void, the gap of negativity, in which mental Events emerge. Idealism, by contrast, substantializes this void' (89). Žižek holds that Deleuze never directly confronts these dual logics of representation and production, materialism and idealism, which are 'fundamentally incompatible' (20). This failure supposedly leads him – mistakenly in Žižek's view – towards Guattari and a crude ontology of production in *Anti-Oedipus*: 'Deleuze [was] pushed toward Guattari because Guattari presented an alibi, an easy escape from the deadlock of his previous position' (21). Deleuze thus bypasses engagement with the central paradoxes that lead post-Hegelian and psychoanalytic theories towards a true materialism built upon contradictory entities such as the phallus, the *objet a*, and so on, in which meaning and sense emerge from a foundational lack. The political implications of this skirting of the issue are profound. 'The ontology of productive Becoming', Žižek claims, 'clearly leads to the Leftist topic of the self-organization of the multitude of molecular groups that resist and undermine the molar, totalizing systems of power' (32) – in other words, Deleuze's turn to Guattari leads directly to the naïve politics of Hardt and Negri's *Empire* (2000). The other ontology may appear sterile and apolitical, but it really 'involves a political logic and practice of its own' and it opens a domain that

is 'crucial in transforming reality' (32). Deleuze seems not to have recognised the politics associated with this ontology, since '*not a single one* of Deleuze's own texts is in any way directly political; Deleuze "in himself" is a highly elitist author, indifferent toward politics' (20).[3]

However, in *The Logic of Sense*, where Deleuze had not yet 'disavow[ed] his own roots' (Žižek 2004: 83), 'the basic premise of Deleuze's ontology . . . that corporeal causality is *not* complete' (27) is developed into a psychoanalytical account of the corporeal origin of incorporeal sense. Providing little or no textual support, Žižek holds Deleuze's account to follow Lacan by giving a foundational role of symbolic castration:

> As it was clear to Deleuze (and not only to Lacan), the notion of castration answers a very specific question: how does the universal symbolic process detach itself from its corporeal roots? How does it *emerge* in its relative autonomy? 'Castration' designates the violent bodily cut that enables us to enter the domain of the incorporeal. (85)

The phallus, of course, is therefore the signifier of this process, which raises sexuality – the one drive that, being both excessive and lacking, is capable of surpassing bodily needs – to the level of neutral, desexualised thought.

> Therein lies the materialist 'wager' of Deleuze and Lacan: the 'desexualization,' the miracle of the advent of the neutral-desexualized surface of Sense-Event, does not rely on the intervention of some transcendent, extrabodily force. It can be derived from the inherent impasse of the sexualized body itself. In this precise sense – shocking as it may sound to vulgar materialists and obscurantists in their unacknowledged solidarity – the phallus, the phallic element as the signifier of 'castration,' is the fundamental category of dialectical materialism. Phallus qua signifier of 'castration' mediates the emergence of the pure surface of Sense-Event . . . it is the 'pseudo cause' that sustains the autonomy of the field of Sense with regard to its true, effective, bodily cause. (91)

This logic, Žižek argues, is jettisoned by the ontology of production found in *Anti-Oedipus* and its division of productive becoming and reified being (92). He thus declares that *Anti-Oedipus* is 'arguably Deleuze's worst book . . . the result of escaping the full confrontation of a deadlock *via* a simplified "flat" solution' (21).

There is certainly a complex and subtle relationship between Deleuze and Lacan – and between Deleuze and Hegel – which, sadly but not unexpectedly, Žižek does little to illuminate. His reading, which attributes to Deleuze a variety of sharp divisions (the central

one being '*The Logic of Sense* versus *Anti-Oedipus*' [Žižek 2004: 21]) and unequivocal positions (for example, that *Anti-Oedipus* is a wholesale rejection of psychoanalysis), is self-serving and simply erroneous.[4] Although there are important and explicitly positive resonances with psychoanalysis in Deleuze's mid to late 1960s solo writings, Žižek is unprepared to do more with them than equate various Deleuzian concepts with Lacanian counterparts. The results in this regard are astonishing: Žižek does not even appear to notice that the psychoanalytical account of the genesis of sense in *The Logic of Sense*, worked out over some 50 pages and eight series of the book, is carried out through a reading of Melanie Klein, not Lacan.[5] Deleuze's turn to Klein is particularly damaging to Žižek's thesis, as she specifically contests the centrality of the castration complex while referring the Freudian Oedipal complex of the child's third and fourth years back to earlier processes of object relations. Given her distinctive position in post-Freudian psychoanalysis and her key differences from Lacan, this would seem to be prima facie evidence that Deleuze, while certainly not rejecting his 'roots', was already thinking independently of them.

Deleuze typically engages with other thinkers by adding a distinctive 'twist' to their thought, resulting in readings that are not particularly faithful, but also not simply invented. With his reading of Klein, Deleuze retraces her revised story of pre-Oedipal and Oedipal development with the twist of inserting the Kleinian infant into a world of simulacra rather than one of substantial objects with stable boundaries. The world of simulacra is no longer a temporary one that the infant outgrows, as it is for Klein, who sees the infant synthesising part-objects into whole and complete objects as its ego develops. As a result of this move, Kleinian processes of splitting and synthesis, which she links to death and life instincts, are in Deleuze's hands no longer dialectical negations and reconciliations. Klein was famously alone among post-Freudians in taking the existence of the death instinct seriously, holding it to operate from birth. Deleuze's alterations of Klein, however, turn the death drive into a force not of negation, but of disjunction. It compels psychic development to go beyond the corporeal and physical and towards a metaphysical surface of sense and thought; but, as this Deleuzian surface is also a surface of nonsense, this process culminates not in the consolidation of the ego, but in its dissolution.

The following discussion will first introduce Klein's reworking of Freud's understandings of the nature of negation and the role of the death instinct in driving psychic development, showing how Deleuze in turn replaces negation with a principle of disjunction in order to

construct an account of the psychic surface that breaks with both Freud and Klein. It will then analyse Klein's pre-Oedipal paranoid-schizoid and manic-depressive positions and the processes of splitting and synthesis that effect the transition from the former to the latter, all of which are the central focus of Deleuze's adoption and reworking of Klein's thought. Finally, it will explore Deleuze's use of these adapted Kleinian themes in his re-reading of the Oedipus complex and the passage from sexual instincts to a desexualised surface of thought, areas where Klein uncritically follows Freud. Deleuze's reading of Klein is certainly not a Lacanian one, assuming such a thing were possible. And indeed, even while it incorporates Lacanian concepts such as the phallus in the Oedipal stage of development, it culminates with a turn to Nietzsche – that is to say, not with the ascendancy of the phallic Law but with creative overcoming and revaluation. In later writings, Deleuze is harshly critical of Klein, holding her to obsessively Oedipalise childhood experiences.[6] Nevertheless, without discounting that changes take place from *The Logic of Sense* to *Anti-Oedipus* to *Dialogues*, it seems that even if the early Deleuze engages affirmatively with the Oedipus story, it is already with the intention of doing something different. Deleuze's early psychoanalytical writings, as will be seen, show him already to be on a decidedly anti-Oedipal path.

I. Surfaces of Negation; Surfaces of Disjunction

In the account of sense developed in *The Logic of Sense*, the notion of *surface* plays a fundamental role. Invoking the language of surface is not meant to oppose sense to a deeper or more substantial essence, as though sense were something superficial. Rather, the surface refers to a plane that brings together but also holds apart distinct domains, much like the ocean's surface separates but also connects water and air. Such a surface belongs to neither domain yet constitutes both. It is therefore a site of differentiation, but it is also a difference in its own right – in Deleuze's terms, it is a 'difference in itself' that serves as a 'differenciator': 'Sense is never only one of the two terms of the duality . . . it is also the frontier, the cutting edge, or the articulation of the difference between the two terms, since it has at its disposal an impenetrability which is its own and within which it is reflected' (Deleuze 1990: 28).[7] Nevertheless, the surface is not a singular phenomenon, as Deleuze indicates by his discussion of two kinds of surface in the early pages of the text. On the one hand, there is a surface formed at the interstices of material bodies; on the other hand, a surface of sense is

embedded in language, allowing the proposition's various functions – the designation of facts, the manifestation of a subject's intentions, and the signification of universal concepts – to operate and 'make sense'. The first surface refers to material simulacra, while the second refers to phantasms of thought. Deleuze's ultimate concern is a second-order surface where these surfaces of thought and thing intersect.[8]

For both Freud and Klein, this second-order surface is the psychic surface, which mediates the mind's contact with the external world. Negation is at once the differenciator and the form of differentiation articulated and carried out on this surface. Freud and Klein differ fundamentally on negation's primary location – external versus internal, real versus phantastic – but they share a traditional understanding of it being a force that, through its powers of separation, denial, repression, and even destruction, at once distinguishes objects and consolidates their distinct identities: through negation, water is water because it is *not* air and vice versa. Thus, for both Freud and Klein, the development of the psychic surface sees it more or less accurately mapped onto the body's physical surface in such a way as to secure the distinction between inside and outside and the adequate correspondence between phantastic objects and real objects.

For Freud, negation enables a compromise with repressed instincts, allowing them to become conscious – to reach the psychic surface – only in the form of denials: I express my desire for my mother only by insisting it does not exist (Freud 1961b: 235–6). It is also an expression of the death instincts turned outwards, both as a desire to possess or destroy external objects and as a symbol of negation that resides within statements and without which the intellect could not achieve independence from the pleasure principle. In its intellectual form, negation firms up the separation of inside from outside: the affirmation and negation of attributes assigned to subjects correspond to the pleasure-ego's oral processes of introjection and projection and thus to the desire to externalise the bad and internalise the good; judgements of existence, linked to the subsequent reality-ego, rest on the idea that what is external is objectively real while what is internal is subjective, phantasic, and imaginary (Freud 1961b: 237–8). All of these real and intellectual negations function throughout the stages of sexual development, in which libido instincts, separating themselves from their original link to vital functions, pass through oral, anal and genital phases, organising the body and its erotogenic zones and allowing external reality to be measured in terms of its promotion or hindrance of libido satisfaction (see Freud 1966: chs 20–1).

Freud holds negation to be absent from the unconscious, where contraries easily condense into one another, and where there is no reference to linear time, with its negative difference between past, present and future, or to death, which is an abstract concept known only to the mind's higher strata (see Freud, 1961a: 57–8; 1966: 178). For this reason, he maintains the development of the psychic surface is driven by external negations, such as the temporary loss and return of objects, which allow the ego to unify and distinguish itself from outside reality (Freud 1994: 3), and the realistic (if not necessarily real) castration threat that underpins neurotic anxiety and the Oedipus complex (Freud 1965: 85–6, 93–4). Such firm and factual separations – the mother's obvious presence or absence, and so forth – thereby consolidate the internal distinctions of the psyche and provide a measuring rod for the adequacy of the child's phantasies to reality. Although the death instinct is an internal source of negation, its existence remains speculative, as it can be glimpsed only obliquely in negations directed outside the self (sadism) or turned back against the self (masochism); but even these indirect signs arise only in response to the denials and frustrations of the external world, making the death instinct's negativity derivative. Thus, at the conclusion of his 'Negation' essay, when linking affirmation and negation to the primordial instincts, Freud declares: 'Affirmation – as a substitute for uniting – belongs to Eros; negation – the *successor* to expulsion – belongs to the instinct of destruction' (Freud 1961b: 239, emphasis added).[9] Once actualised, the death instinct's negativity is crucial to completing the psychic surface; in being turned outwards and then back, it establishes conscience and the superego. These final negations exceed the ego's reality principle, internalise the real negativity of external authority figures, and desexualise libido energies so they can be sublimated into thought. But they are once again linked by Freud to actual external events through his insistence on the reality of childhood events of trauma and on there being a real event of primal patricide at the foundation of individual and collective psychic life. Freud's aspiration to scientific rigour leads him to this privileging of the external world's negations in the constitution of the psychic surface: as he states in the *Introductory Lectures*, he prefers to represent the origin of psychic conflict in terms of an external frustration that is supplemented by an internal one because 'it hints at the probability that the internal impediments arose from real external obstacles during the prehistoric periods of human development' (Freud 1966: 350).

Klein inverts many of the priorities in Freud's conception of early development. She pushes the start of the Oedipus complex back, first

to the beginning of the second year and ultimately to the second six months of life (see Klein 1998: 129 and 1975: 2), holding it to be largely completed by age three (Klein 1998: 151). Moreover, she links the formation of the Freudian superego to a series of pre-Oedipal developments, but she also posits the existence of an infantile superego and a pregenital sense of guilt that are far more persecutory than what Freud sees as the culmination of the Oedipus complex (Klein 1998: 133, 186–7). Although initially accepting the thesis of primary narcissism (Klein 1998: 85, 128), she eventually holds all narcissism and auto-eroticism to result from object relations, thereby taking the processes of introjection and projection to be primary (Klein 1975: 13, 51). As a result, it is no longer possible to privilege real and external negations in psychic development, and the worlds of phantasy and reality are intertwined: 'external and internal situations are always interdependent, since introjection and projection operate side by side from the beginning of life' (Klein 1975: 139). Early psychic life is governed by the often violent interplay between these two worlds, each mirroring but also distorting the other, but external negations are fundamentally displaced, as Klein maintains that the death instinct's destructiveness and a corresponding unconscious fear of death are present from birth. Consequently, the origins of anxiety, mastery of which is both the primary task of the ego (Klein 1986: 216) and the essential determinant of normal versus neurotic psychic development (Klein 1989: 176–7), cannot be located in external frustrations such as those linked to weaning, the loss of the mother, or castration threat imposed by the father. Castration anxiety 'is a modification, in the course of development, of the earliest anxiety situation', which is created by the projection of excessive cruelty onto both parents by 'the early sadistic super-ego' (Klein 1998: 213). Moreover, 'if we assume the existence of a death instinct, we must also assume that in the deepest layers of the mind there is a response to this instinct in the form of fear of annihilation of life. Thus . . . the danger arising from the inner working of the death instinct is the first cause of anxiety' (Klein 1975: 29). The psychic surface now arises only when, through phantasy, these destructive impulses are thrust outward – the sadistic phantasies wrapped up in the oral-sucking phase constitute the child's first relation to the external world (Klein 1998: 292–3) and they continue in the anal-sadistic phase where faeces and urine are seen as poisons (Klein 1998: 219–20) – and are then modified so that the anxiety displaced onto the external world does not overwhelm the still weak infantile ego and prevent the stabilisation of symbolic relations (Klein

1998: 232). Conversely, schizophrenia develops when 'the capacity for personification and for transference fails, amongst other reasons, through the defective functioning of the projection-mechanism' (Klein 1998: 208), leading to 'a severe inhibition of the capacity to form and use symbols, and so to develop phantasy life' (Klein 1975: 138). As it is also for Deleuze, schizophrenia amounts to a failure to establish a psychic surface able to mediate the connection between words and things (Deleuze 1990: 82–93). A controlled deployment of sadistic phantasy is therefore crucial to psychic development.

Against both Freud and Klein, Deleuze refuses to accept negation as the differenciator and driving force in the surface's development. Instead, he posits a differenciator that carries out a 'disjunctive synthesis' among the differences related at and through the surface. Negation certainly establishes a disjunction among differences, but Deleuze holds that its disjunction remains a kind of exclusion. With negation, differences only communicate to the degree to which they still mirror one another, making it yet another way in which difference is submitted to the principles of identity, as what diverges no longer relates. In contrast, the challenge, Deleuze holds, is to make 'divergence . . . no longer a principle of exclusion, and disjunction no longer a means of separation. Incompossibility is now a means of communication . . . the whole question, and rightly so, is to know under what conditions the disjunction is a veritable synthesis' (Deleuze 1990: 174). Such a synthesis requires that 'everything happens through the resonance of disparates, point of view on a point of view, displacement of perspective, differentiation of difference, and not through the identity of contraries' (Deleuze 1990: 175). Such a disjunctive synthesis, relating the differences it brings together *through their difference* rather than any unity, constitutes the surface as the site of an 'event'. This event is not merely a factual or real occasion, but a communication between real and phantastic worlds, which never correspond. Thus, 'on one side, there is the part of the event which is realized and accomplished; on the other, there is that "part of the event which cannot realize its accomplishment"' (Deleuze 1990: 151–2).

Being committed to negation, Klein certainly does not theorise psychic development in terms of this kind of resonance. Indeed, for her, normal development culminates with the ego consolidating itself in such a way that the psychic surface not only maintains the negative separation of inner and outer worlds but also allows the former to become sufficiently stable so that it can mirror the distinct objects found in the latter. Even though she rejects Freud's privileging of real negations, Klein in many

respects follows his 'scientific' approach of treating the real separations between real objects as the standard to determine successful formation of a stable psyche. However, the resonance and communication of divergences is precisely what Klein portrays in her analysis of the infant's initial situation, a condition in which it encounters only fragmentary 'part-objects' that are simultaneously good and bad, loving and terrifying. The negative force of the infant's aggressive instincts, along with the real stability of the external divisions to which its phantasms ultimately conform, allow the infant eventually to organise its world into fairly unambiguous, stable, and complete objects. But for Deleuze, no such external stability exists and aggressive instincts are not forces of negation but rather of disjunction. In Deleuze's account, therefore, the synthesis of part-objects never fully overcomes their divergence.

II. From the Paranoid-Schizoid Position to the Manic-Depressive Position

The major part of Deleuze's engagement with Klein deals with her theory of pre-Oedipal positions.[10] The Kleinian infant first encounters a chaotic world of part-objects, from which 'springs . . . the phantastic and unrealistic nature of the child's relation to all objects . . . The object-world of the child in the first two or three months of its life could be described as consisting of hostile and persecuting, or else of gratifying parts and portions of the real world' (Klein 1998: 285). The breast, which contains all nourishment but does not guarantee its presence or generosity, is the prototype for good and bad part-objects alike. Through phantasy, the infant's loving and aggressive impulses are projected onto it, so that it becomes at once benevolent and persecutory; but these aspects are also introjected and become extreme imagos operating within the psyche. Projection corresponds to object-relationship while introjection corresponds to superego formation (Klein 1989: 178). Phantastic imagos mirror and are mirrored by external objects: 'for all children in the beginning external reality is mainly a mirror of the child's own instinctual life' (Klein 1998: 233); 'from the very beginning of psychic development there is a constant correlation of real objects with those installed within the ego' (Klein 1998: 266). This explains the child's fixation on its mother even if, because of severe distortion in its perceptions of both the internal and the external worlds, its phantasy life remains inadequate to reality. A resonance thus emerges between a

simulacrum of part-objects[11] and a phantasm of imagos, with the infant unable to clearly distinguish the real from the imagined.

For Klein's infant, part-objects are not only mixed together but are also merged. The mother being considered the source of all good things, the father's penis is thought to be within her (Klein 1989: 195). Indeed, 'according to the child's earliest phantasies (or "sexual theories") of parental coitus, the father's penis (or his whole body) becomes incorporated in the mother during the act' (Klein 1998: 219). Moreover, reflecting the ambivalence in the child's sexual and aggressive impulses, these part-objects are seemingly intractable amalgamations of good and bad, making them both loved and hated objects, and this ambivalence is also internalised through introjection. Both parents come to be seen as castrators (Klein 1998: 190; also 1989: 131) and are even united into a single terrifying imago (Klein 1989: 253). As real and phantastic objects double one another, with reality tests applied to the external parents serving as an indirect way of judging the corresponding internal imagos,[12] a dialectic arises between inner and outer worlds that reinforces infantile anxieties.

> From the beginning the ego introjects objects 'good' and 'bad', for both of which its mother's breast is the prototype – for good objects when the child obtains it, for bad ones when it fails him. But it is because the baby projects its own aggression on to these objects that it feels them to be 'bad' and not only in that they frustrate its desires: the child conceives of them as actually dangerous – persecutors who it fears will devour it, scoop out the inside of its body, cut it to pieces, poison it – in short, compassing its destruction by all the means which sadism can devise. These imagos, which are a phantastically distorted picture of the real objects upon which they are based, become installed not only in the outside world but, by the process of incorporation, also within the ego. Hence, quite little children pass through anxiety-situations (and react to them with defence-mechanisms), the content of which is comparable to that of the psychoses of adults. (Klein 1998: 262)

Responding like a tiny Manichean, the infant struggles to secure itself from anxiety by strictly separating good and bad. It does this through both phantasies and real actions, unable completely to tell the difference. It thus it takes its most sadistic phantasies to be acts it has really carried out on its parents.[13] Its ego being weak and dispersed, splitting is the infant's primary defence mechanism. Its sadistic and aggressive impulses being ascendant, the infant aims to divide part-objects, expelling and destroying what it deems bad and introjecting and possessing the good. But as its world lacks any stable boundaries, these separations cannot be sustained. To ward off the anxiety generated internally by its own

death instinct, the infant directs its aggression against bad part-objects, but anxiety then returns as a fear of these objects retaliating (Klein 1998: 220); meanwhile, the infant cannot project its aggression onto external part-objects without also identifying with these part-objects and so re-internalising the bad, the end result being that it suffers persecutory anxieties from both internal and external attackers. Attempts to introject the good object so as to protect it are ultimately ambiguous because of continuing anxiety and the infant's sense that its inside is also a bad place (Klein 1998: 264–5). Furthermore, 'the ego is incapable of splitting the object – internal and external – without a corresponding splitting taking place within the ego' (Klein 1975: 6), so that the ego's own defence mechanisms weaken it. On the one hand, the ego becomes excessively dependent on external objects it idealises as good (Klein 1975: 9); on the other hand, while the ego strengthens itself by introjecting good part-objects, it cannot avoid incorporating bad or sadistic objects as well. Finally, since good and bad cannot be cleanly separated, attacks on bad part-objects necessarily bring harm to good part-objects as well (Klein 1975: 6), and good objects are easily transformed into bad ones (Klein 1998: 268).

All of this defines the paranoid-schizoid position that dominates the first months of life: 'The accumulation of anxieties of this nature, in which the ego is, as it were, caught between a variety of external and internal persecution-situations, is a basic element in paranoia' (Klein 1975: 11–12). It is marked by an early superego that works off the anxiety aroused by the child's sadism, as opposed to the adult superego that 'arouses less anxiety and more sense of guilt' (Klein 1998: 252). However, as sexual development approaches the genital stage, where sexual instincts finally attain independence from vital and aggressive ones, libidinal impulses grow stronger and sadistic ones weaken (Klein 1989: 175). With this, the most terrifying and anxiety-producing imagos retreat, the discrepancy between the superego's phantastic objects and the ego's real objects diminishes, and the ego's suppression of the id becomes less violent (Klein 1989: 154–5). As early sadism subsides, the infant can synthesise part-objects into complete objects, coming to see its mother as a person, for example. But in achieving this synthesis of good and bad part-objects, the resulting unity is a whole but damaged love object.

The infant now enters a new, manic-depressive position, characterised by feeling the loss of the loved object – 'Not until the object is loved *as a whole* can its loss be felt as a whole' (Klein 1998: 264). Its stronger ego being more capable of love but also now able to assume

responsibility for itself, 'depressive anxiety is intensified, for the infant feels he has destroyed or is destroying a whole object by his greed and uncontrollable aggression . . . he now feels that these destructive impulses are directed against a *loved person*' (Klein 1975: 50). A quest now begins to repair the damaged parent, its specific form guided by the choice of primary sexual object at the genital stage: the boy, whose libido changes to the aim of penetration, retains the mother as his primary object, while the girl, keeping the receptive aim of the earlier oral phase, turns to the father (Klein 1998: 186). The project is encouraged by a new sense of omnipotence, which works as a defence against depressive anxiety but which is also closely bound up with unconscious sadistic impulses, so that 'the child feels again and again that his attempts at reparation have not succeeded, or will not succeed' (Klein 1998: 350). The penis – visible in the boy's case and introjected from the father in the girl's – becomes the representative of this power (Klein 1998: 244; also 1989: 233) and thus a tool of reparation. For the boy, 'the penis is then felt to be a good and curative organ, which shall afford the woman pleasure, cure her injured genital and create babies in her' (Klein 1998: 315), while for the girl, the discovery that she cannot make these reparations leads her to penis-envy (Klein 1989: 216). At this point, obviously, the Freudian Oedipus complex appears: 'Anxiety and guilt add a powerful impetus towards the beginning of the Oedipus complex' (Klein 1975: 50). Its resolution, like its inception, is made possible by the passage through the two pre-Oedipal positions, as a result of which 'the demarcation between conscious and unconscious is more distinct. These developments make it possible for repression to take a leading part among the defences' (Klein 1975: 86). Through its use of repression, the ego can now fulfil the demands of the superego without risking itself: 'since in repression the splitting predominantly effects a division between conscious and unconscious, neither part of the self is exposed to the degree of disintegration which may arise in previous stages' (Klein 1975: 86). Repression is also a pre-requisite for symbol formation, which functions primarily to direct the sublimation of libido energies towards non-sexual interests (Klein 1998: 86; see also 221, and 1975: 83, 115, 137–8). The next several years are filled with vacillations and regressions, but culminate in the resolution of the Oedipus complex and the establishment of the final form of the superego.

The development Klein traces depends on the separations between real objects being sufficiently stable so that phantastic imagos can adapt to them. Because there are real complete objects to which the child can conform, it is able to move from the paranoid-schizoid to the

manic-depressive position and then to the Oedipus complex. Deleuze breaks with Klein precisely on this point: the child, he holds, never outgrows the original chaos of part-objects, because reality is a simulacrum – a multiplicity of differences that never form a unity because they are synthesised through a 'difference in itself' that both connects them and sustains their discontinuity. As such, the phantasm of imagos that relates to this external reality at and through the psychic surface can never amount to a good or bad copy of this reality, and the issue of whether phantasms have real or imaginary causes is thereby displaced. The two domains relate not through their correspondence but rather through their difference: 'phantasms, even when they are effects and because they are effects, differ in nature from their real causes' (Deleuze 1990: 210–11). However, the phantasm itself is also a disjunctive synthesis, and, as such, it is constituted as an event within thought that allows thought's linguistic propositions, which relate it to things, to 'make sense'. As such, negation – whether held to originate in the psyche or in the outside world – cannot account for the separations between the constituents of the internal and external domains, nor the separations between the domains themselves. Indeed, it is not even a matter of the two worlds being separated but also mediated in a way adequate to reality, but of their folding into and resonating with each other: 'The question of whether particular events are real or imaginary is poorly posed. The distinction is not between the imaginary and the real, but between the event as such and the corporeal state of affairs which incites it about or in which it is actualized' (Deleuze 1990: 210).

But the effects of replacing negation with disjunction go beyond just preventing any final stability for Klein's infant. It also changes completely the mechanism of the child's passage through pre-Oedipal positions. The infant may never be successful in this world of simulacra, but it nonetheless endeavours to split the good from the bad, and, eventually, to repair a complete good object and identify with it (Deleuze 1990: 187–8). However, Deleuze maintains, since good is associated with purity and fullness, all part-objects are necessarily bad: 'every piece is bad in principle (that is, persecuting and persecutor), only what is wholesome and complete is good' (188). Furthermore, and against Klein, Deleuze contends that because of the ambivalences associated with introjection and projection, these processes cannot secure the synthesis that constitutes the good object: 'introjection, to be precise, does not allow what is wholesome to subsist . . . the equilibrium proper to the schizoid position and its relation to the subsequent depressive position do not seem capable of coming about from the introjection

of a good object as such, and they must be revised' (188). But given that reality does not offer whole objects with stable boundaries to serve as a guide, where within the simulacrum of corporeal part-objects does the child find inspiration for its enterprise? The answer for Deleuze is in the simulacrum's differenciator, here termed the 'body without organs' – 'what the schizoid position opposes to bad partial objects . . . is . . . an organism without parts, a body without organs, with neither mouth nor anus, having given up all introjection or projection, and being complete, at this price' (188). Deleuze associates this body without organs with the urethral attacks of the anal-sadistic phase (188–9), noting that Klein makes no such distinction between urine and faeces (351–2 n. 3). Circulating through the dispersed part-objects, this fluid body without organs provides a principle of purity that the child can use to organise itself and its surroundings. But its resistance to introjection also places it on another level, which corresponds to the manic-depressive position that follows the paranoid-schizoid position.

> It seems to us that the good object is not introjected as such, because it belongs from the very start to another dimension. The good object has another 'position.' It belong to the heights, it holds itself above, and does not allow itself to fall without also changing its nature . . . The superego does not begin with the first introjected objects, as Melanie Klein says, but rather with this good object which holds itself aloft. (189)

Thus, although the splitting process does not move the infant out of the paranoid-schizoid position, the mechanism for this transition is immanent to it, as the good object 'forms itself in the current of this [schizoid] position, with borrowings, blockages, and pressures which attest to a constant communication between the two [positions]' (190). The way the body without organs, arising from within the simulacrum of part-objects, generates the *appearance* of a transcendent reference point, an 'idol on high' (192), raises the infant to the manic-depressive position. From there, it sets the conditions for the intervention of the castration threat and thus the introduction of the Oedipal drama.

III. From Oedipus to the Thought of Eternal Return

For Klein, the passage through the Oedipus complex brings the superego and external objects into alignment so as to comply with both the requirements of reality and phantastic commands (Klein 1989: 180). Upon reaching this level, 'the internalized imagos will approximate more closely to reality and the ego will identify itself more fully with "good"

objects' (Klein 1998: 264). As the child learns that its own aggression was the source of bad objects, it comes to see its parents more accurately (Klein 1975: 242). Thus, although every synthesis of good and bad part-objects also renews the splitting of imagos, 'this splitting is carried out on planes which gradually become increasingly nearer and nearer to reality' (Klein 1998: 288).[14] In contrast, Deleuze rejects the possibility of such correspondence because the complete good object that leads psychic development from the paranoid-schizoid to the manic-depressive position and beyond is not a real object but only a simulation. At this point Lacanian elements enter Deleuze's account, as the good object becomes associated with the phallus.[15] The phallus 'marks always an excess and a lack . . . It is essentially an excess, as it projects itself over the genital zone of the child, duplicating its penis, and inspiring it with the Oedipal affair. But it is essentially lack and deficiency when it designates, at the heart of the affair, the absence of the penis in the case of the mother' (Deleuze 1990: 227–8). Nevertheless, this does not make it a foundational negativity. Instead, 'oscillating between one and the other [excess and lack] and even being both at once' (227), the phallus is fundamentally a differenciator of difference. As such, its negativity is at best derivative. Furthermore, acting as a differenciator, the phallus does not ultimately consolidate the ego but instead effects its dissolution.

Consigned to the heights, 'the good object is by nature a lost object. It only shows itself and appears from the start as already lost, as *having been lost*' (Deleuze 1990: 191). Its ambivalence is thus fundamentally different than the ambivalence of part-objects in the paranoid-schizoid position: it is both loving and threatening because it is pure, mysterious and good (191). Characterised as transcendent, the good object begins the separation of the incorporeal from the corporeal – 'the depressive position prepares us for something which is *neither action nor passion*' (192) – but, as a hidden source, it lacks the connection to subjects, objects, and concepts required for the incorporeality of language and thought. The good object 'has the dimensions of a language without having its condition; it awaits the *event* that will make it a language' (193). In other words, it must be reinvested, not into the part-objects that belong to an opposing world of depth, but onto a surface that can cause the two domains to resonate.

This is achieved through the good object's organisation of erotogenetic zones on the body's physical surface, a process that culminates in the genital phase, where sexual drives attain their independence and the libido becomes 'a veritable *superficial energy*' (Deleuze 1990: 199). In this process, the phallus becomes the privileged

signifier of the lost object, serving 'the direct and global function of integration, or of general coordination . . . And the phallus, in this respect, does not play the role of an organ, but rather that of a particular image projected . . . onto this privileged (genital) zone' (200). But rather than being a signifier of transcendent law, the phallus is an image donated by the good object – 'the child receives the phallus as an image that the good ideal penis projects over the genital zone of his body' (203) – but a donation that inhabits the surface, aiming to mediate the child's relation to the heights. It is 'an instrument of the surface, meant to *mend* the wounds that the destructive drives . . . have inflicted on the maternal body, and to reassure the good object, to convince it not to turn its face away' (201). It gives 'to the child's penis the force of embarking on the venture' (206) of making reparations to the damaged object. However, it also initiates Oedipal anxiety, introducing negation into the story as the delineation of the sexual surface defines the mother's body by a lack and elevates the father to the position of being owner of the penis. For the boy, his loving attempt to restore his mother by substituting himself for his father also introduces murder and castration: 'by wishing to restore the mother, the child has in fact castrated and eventrated her; and . . . by wishing to bring back the father, the child has betrayed and killed him, transformed him into a cadaver' (206). The destructive impulses, which were subordinated along with the pregenital organisation of the sexual surface when libidinal instincts were elevated, now return, but in a different form, as the Oedipal drama establishes 'intention as an ethical category' (206), which raises the agency of aggressive impulses to a new level of thought. Death and castration carry out a desexualisation of libido energies, which are then sublimated to form 'the second screen, the cerebral or metaphysical surface' (218). Oedipus thereby not only traces a line of castration on the physical surface of the body, but enacts a process of symbolisation (208).

Death, castration and murder now become the never fully identifiable components of an Oedipal phantasm that circulates between the physical surface of sexuality and the metaphysical surface of thought. Deleuze here rejects the Kleinian ascription of phantasms to the pre-Oedipal positions, holding the phantasm to arise only with desexualisation and symbolisation, not prior to them (Deleuze 1990: 215–16). Through the phantasm acting as a differenciator between the physical and metaphysical surfaces, sexuality is brought into thought, as the trace of castration remains even after sexual energies have been sublimated, while, thought, via symbolisation, reinvests its desexualised energies onto the body's surface (242–3). The two surfaces thereby fold into

each other yet remain irreducible: the sexual organisation of thought prefigures language (230–3, 241–2), but language arises only in so far as sexuality is sublimated into something different; symbolisation, in turn, never fully collapses the symbol into what is symbolised. The Oedipal phantasm resonates between these sexual and desexualised surfaces, but it also refers to the pregenital and genital organisations of the body, since it constitutes a traumatic event that separates the two orders and, indeed, constitutes them through this separation (226). Through the phantasm, pregenital and genital sexualities continue to resonate in the unconscious (240).

Ultimately, then, the Deleuzian surface is composed of disjunctions upon disjunctions: the disjunctions of simulacra produce the appearance of the lost good object that, through the image of the phallus, guides the separation of sexual and aggressive drives and the subordination of the pregenital organisation of the sexual surface to the genital organisation; the disjunction of these surfaces via castration desexualises and sublimates libido energies into thought; and the surfaces of sexuality and thought continue to resonate through their difference. The body without organs, the phallus donated by the good object, and the Oedipal phantasm are the three surface differenciators effecting the necessary disjunctive syntheses. Each is a difference in its own right, a 'difference in itself' marked by a certain opacity, but each is also immanent to the differences it brings together. But only the phantasm brings together all the constituents, as it 'recovers and integrates not only images but even idols and simulacra' (Deleuze 1990: 219). And, ultimately, it is the resonance of the phantasm's disjunctive movement that is the nonsense that generates sense, although this includes the phallus in so far as it 'gets involved in Oedipal dissociations' (227). The phantasm functions in this way because

> throughout all of that which language will designate, manifest, or signify, there will be a sexual history that will never be designated, manifested, or signified in itself, but which will coexist with all the operations of language, recalling the sexual appurtenance of the formative linguistic elements. This status of sexuality accounts for repression. (243)[16]

The phantasm thereby underpins the identities of denoted bodies, signified concepts, and the self that manifests or expresses itself in language; but precisely because it is a movement of disjunction, the phantasm is also linked to a decentring through which these identities, and particularly the identity of the ego, are dissolved. Although the

phantasm 'finds its point of departure (or its author) in the phallic ego of secondary narcissism', seeming to depend on the pre-Oedipal consolidation of the ego traced by Klein, within the phantasm the ego 'is neither active nor passive and does not allow itself at any moment to be fixed in a place, even if this place were reversible' (212). This dissolution of the ego, Deleuze argues, must not be confused with a similar dissolution carried out in dialectics: 'if the ego is dissipated in it [the phantasm], it is not perhaps because of an identity of contraries, or a reversal whereby the active would become passive' (213). Arising through disjunction, this process transforms the ego into an event: 'the individuality of the ego merges with the event of the phantasm itself, even if that which the event represents in the phantasm is understood as another individual, or rather a series of individuals through which the dissolved ego passes' (213–14).

As 'the process of the constitution of the incorporeal' (Deleuze 1990: 220), the phantasm's extrinsic or external beginning is castration (219), but it also has an intrinsic beginning in a 'repetition of beginnings' (220) – that is to say, in the resonance of pregenital and genital sexual series through the differenciator of the phallus, each series repeating the other without one being the original and the other the copy. Ultimately, however, 'the phantasm develops to the extent that the resonance induces a *forced movement* that goes beyond and sweeps away the basic series ... the forced movement of an amplitude greater than the initial movement' (239). In this regard, while Eros's sexual instincts initiate the surface's development, it is Thanatos, the death instinct, that performs the excessive forced movement, dissolving the ego, desexualising libido instincts, and sublimating them into thought: 'We can therefore name the entire forced movement "death instinct," and name its full amplitude "metaphysical surface"' (240). In *Difference and Repetition*, Deleuze criticises Freud for restricting himself to a material model of death and brute repetition, which is reflected in the conception of the death instinct as a drive to return to an earlier, inorganic state (Deleuze 1994: 111–12). With Freud, death is thereby 'reduced to negation ... to the negative of opposition ... [or] the negative of limitation' (112). But with the death instinct transformed into a force of disjunction, it becomes the principle of the repetition/resonance of sexuality, driving sexuality beyond itself: 'Thanatos (as transcendental principle) is that which gives repetition to Eros, that which submits Eros to repetition' (18).

The creation of the surface now culminates with Nietzsche, as the Oedipal phantasm becomes 'the site of the eternal return' (Deleuze 1990: 220). Although the phantasm could not have emerged without the

positing of the idol of the lost good object, it ends with 'the subversion of this world – the "twilight of the idols"' (262). It ends, in other words, with the destruction of the Oedipal Law. By dissolving the ego, the phantasm paves the way for self-overcoming. And by raising disjunction to the level of thinking and going beyond its sexual origins, it makes way for a creative break with the compulsions and necessities of both the instincts and the past. In explaining the temporal structure of eternal return, Deleuze argues that 'the present is no more than an actor, an author, an agent destined to be effaced; while the past is no more than a condition operating by default' (Deleuze 1994: 94). The past delineates the conditions for action in the present, but action still could not occur without a consolidation of the ego in relation to an ego-ideal from on high, which makes the self equal to the task (110–11). Nevertheless,

> the event and the act possess a secret coherence which excludes that of the self... they turn back against the self which has become their equal and smash it to pieces, as though the bearer of the new world were carried away and dispersed by the shock of the multiplicity to which it gives birth: what the self has become equal to is the unequal in itself. (89–90)

There is thus a link between the eternal return, death and the future's openness.[17] To think and to act is to work off of a simulation of transcendent unity in order to replace unity with a resonance and communication between divergent differences.

There is, of course, an uncreative form of thinking – 'the risk is obviously that the phantasm falls back on the poorest thought, on a puerile and redundant diurnal reverie "about" sexuality' (Deleuze 1990: 220) – but when the phantasm sustains the resonance between sexuality and thought, it finds its 'path of glory' in the thought of eternal return: 'What kind of metamorphosis is it, when thought invests (or reinvests) that which is projected over its surface with its own desexualised energy? The answer is that thought does it in the guise of the Event' (220). Raised to this level, thinking becomes inseparable from transmutation and the revaluation of values, and to a dissolution of identity that is part and parcel of Deleuze's political and philosophical thought throughout his corpus.[18]

Notes

1. This paper is a development of analyses first published in my *Reflections on Time and Politics* (Widder 2008). They were also presented in a paper of the same title at the first annual *Deleuze Studies* conference in Cardiff in August 2008.

2. Deleuze himself asks: 'How can we maintain both that sense produces even the states of affairs in which it is embodied, and that it is itself produced by these states of affairs or the actions and passions of bodies (an immaculate conception)?' (Deleuze 1990: 124).
3. The politics linked to this seemingly sterile ontology is, of course, the one that is explored in different ways by Žižek, Laclau and Mouffe (1985), and others who insist upon the need to construct collective identity through strategies such as hegemonic articulation. On the limitations of the political theory and practice that Žižek seems to think goes unnoticed by Deleuze and his followers, see Widder (2000). The differences between contemporary Deleuze- and Lacan-inspired approaches to ontology and politics has been cashed out by Tønder and Thomassen (2005). The contributions to that volume show quite clearly that Deleuzian politics is neither limited to the Hardt and Negri variety nor reducible to the collaborative work with Guattari.
4. In addition to little direct engagement with Deleuze, Žižek singularly ignores evidence of Lacan's approval of – or at least his unwillingness to dismiss – *Anti-Oedipus* (see Smith 2004: 635–6), as well as Deleuze and Guattari's consistent separation of Lacan from Lacanianism, which is apparent all the way up through Deleuze's highly critical and polemical 'Dead Psychoanalysis: Analyse', where he writes: 'It cannot be said that they [psychoanalysts] are very jolly; see the dead look they have, their stiff necks (only Lacan has kept a certain sense of laughter, but he admits that he is forced to laugh alone)' (Deleuze and Parnet 1987: 82). Moreover, Žižek's reading is built around the questionable ascription of a series of oppositions to Deleuze's thought, many taken from Badiou's *Deleuze: The Clamour of Being* (Badiou 2000), on which Žižek admits he relied extensively (Žižek 2004: 20 n. 24). It is simply a joke, for example, to equate the virtual with pure becoming and the actual with stable and reified being, as Žižek consistently does (see Žižek 2004: 9–10, 20, 24, 26, 28), or to proclaim that 'virtualization and actualization are two sides of the same coin' (84). The former idea is belied by Deleuze's statement in *Difference and Repetition* that 'all identities are only simulated, produced as an optical "effect" by the more profound game of difference and repetition' (Deleuze 1994: xix), which suggests that no coagulation of becoming *actually* takes place; the latter is contradicted by Deleuze and Guattari's statement that 'if we go back up in the opposite direction, from states of affairs to the virtual, the line is not the same because it is not the same virtual (we can therefore go down it as well without it merging with the previous line)' (Deleuze and Guattari 1994: 156). Of course, it goes unnoticed by Žižek that Deleuze does not even use the terminology of virtual and actual in *The Logic of Sense*. This paper does not aim to go systematically through Žižek's reading, but Smith (2004) provides an excellent review. On Deleuze's relationship with Hegel see Smith (2000); Widder (2003; 2008). On his relationship to Lacan see Widder (2005; 2008).
5. Indeed, Melanie Klein is not mentioned once in Žižek's book – although Naomi Klein earns some of his attention.
6. 'When Melanie Klein's children say "a tummy" or ask "How do people grow up?," Melanie Klein hears "my mummy's tummy" or "Will I be big like my daddy?" When they say "a Hitler," "a Churchill," Melanie Klein sees here the possessive of the bad mother or of the good father' (Deleuze and Parnet 1987: 79).
7. On 'difference in itself' as a differenciator of difference, see Deleuze (1994: 117).
8. Deleuze here follows Émile Bréhier's (1997) reading of the ancient Stoics' conception of the four incorporeals: place, void, time and sayables (*lekta*).

On the one hand, Bréhier maintains that Stoic incorporeals have the character of becomings or events that arise from and circumscribe the interactions of corporeal bodies; on the other hand, he holds them to constitute corporeal interactions, which could not occur without these incorporeals acting as a surface through which bodies interact. The incorporeals embedded in corporeal utterances allow these utterances to have meaning and to correspond to the events that arise from bodies. The relationship of these incorporeals thereby forms a surface that allows corporeal thought and the corporeal world to connect. Deleuze here breaks with Bréhier by treating this surface as a disjunctive differenciator that brings together thought and things but prevents them from ever corresponding.

9. This issue of negation's secondary status is taken up in Lacan's seminars. Hyppolite (in Lacan 2006: 746–54) holds that as a successor to expulsion, negation must be a distinct and subsequent development of the death drive, whose original processes can be pleasurable. Lacan himself (2006: 308–33) holds Freud's expulsion to refer to a primordial excision of oral impulses that goes beyond repression and constitutes the real, making negation a subsequent symbolisation of the trace of this unsayable real. On the controversy that ensued between Klein and her opponents over the existence of negativity and anxiety in the infantile unconscious see Kristeva (2001: 169–77) and Rose (1993: ch. 5), who both also discuss Klein's theories of negation and symbolisation in relation to Lacan.
10. Klein explains her use of the term 'position', which she introduces after *The Psycho-Analysis of Children* (Klein 1989), as follows: 'I chose the term "position" in regard to the paranoid and depressive phases because these groupings of anxieties and defences, although arising first during the earliest stages, are not restricted to them but occur and recur during the first years of childhood and under certain circumstances in later life' (Klein 1975: 93).
11. Deleuze explicitly uses the term 'simulacra' to describe the early world of Klein's infant: 'We call this world of introjected and projected, alimentary and excremental partial internal objects the world of *simulacra*' (Deleuze 1990: 187).
12. 'The fact that by being internalized, people, things, situations and happenings – the whole inner world which is being built up – becomes inaccessible to the child's accurate observation and judgement, and cannot be verified by the means of perception which are available in connection with the tangible and palpable object-world, has an important bearing on the phantastic nature of this inner world. The ensuing doubts, uncertainties and anxieties act as a continuous incentive to the young child to observe and make sure about the external object-world, from which this inner world springs, and by these means to understand the internal one better. The visible mother thus provides continuous proofs of what the "internal" mother is like, whether she is loving or angry, helpful or revengeful' (Klein 1998: 346).
13. 'A most important feature of these destructive phantasies, which are tantamount to death-wishes, is that the baby feels that what he desires in his phantasies has really taken place; that is to say he feels that he *has really destroyed* the object of his destructive impulses, and is going on destroying it: this has extremely important consequences for the development of his mind' (Klein 1998: 308).
14. This reconciliation of phantasy and reality, however, seems largely an assumption. And, as Klein acknowledges, irrational splitting and idealisation recur in adolescence: 'Young people tend to be very aggressive and unpleasant to their parents, and to other people who lend themselves to it, such as servants, a weak teacher, or disliked schoolmates. But when hatred reaches such strength, the necessity to preserve goodness and love within and without becomes all the

more urgent. The aggressive youth is therefore driven to find people whom he can look up to and idealize' (Klein 1998: 329).

15. The link to Lacan is made even stronger by Lacan's association of the phallus with simulacra: 'The phallus can be better understood on the basis of its function here. In Freudian doctrine, the phallus is not a fantasy, if we are to view fantasy as an imaginary effect. Nor is it as such an object (part-, internal, good, bad, etc.) inasmuch as "object" tends to gauge the reality involved in a relationship. Still less is it the organ – penis or clitoris – that it symbolizes. And it is no accident that Freud adopted as a reference the simulacrum it represented to the Ancients' (Lacan 2006: 690).
16. The secondary status of repression is also a theme in *Difference and Repetition*: 'I do not repeat because I repress. I repress because I repeat, I forget because I repeat. I repress, because I can live certain things or certain experiences only in the mode of repetition. I am determined to repress whatever would prevent me from living them thus' (Deleuze 1994: 18).
17. 'The ultimate synthesis concerns only the future, since it announces in the superego the destruction of the Id and the ego, of the past as well as the present, of the condition and the agent . . . If there is an essential relation between eternal return and death, it is because it promises and implies "once and for all" the death of that which is one. If there is an essential relation with the future, it is because the future is the deployment and explication of the multiple, of the different and of the fortuitous, for themselves and "for all times"' (Deleuze 1994: 115).
18. These last connections between death, the death instinct, the structure of time and Nietzsche's eternal return are developed more fully in Widder (2008).

Forum on Deleuze and Bacon
Introduction: *Folie à Deux*

Andrew Conio University of Wolverhampton

On the 29 November 2008, to coincide with the first major retrospective of Francis Bacon's works to be held in Britain since 1992, Darren Ambrose, Andrew Conio, Margarita Gluzberg and Simon O'Sullivan spoke at Tate Britain about the extraordinary *folie à deux* between Gilles Deleuze and Francis Bacon.[1] This event was an important opportunity to evaluate the potential of Deleuze's work to lift the debate about Francis Bacon away from the art historical, technical and psychological clichés to be found in other works and bring to bear the full panoply of Deleuze and Guattari's conceptual armoury to be found in *Francis Bacon: The Logic of Sensation*, and in Deleuze's more general aesthetic theory and philosophy. None of the speakers adopted a slavish conformity to Deleuze's claims, preferring active, productive encounters with some of Deleuze's most problematic aesthetic concepts. Three of these papers are presented here, each providing very different reflections on the multiple paths into and out of this open and expansive relationship between painter and philosopher.

Darren Ambrose attends to Deleuze's complex hypothesis on the nature of the triptych, its law and order, and particularly how the triptych reconfigures the figural as rhythm. In this peristaltic rhythm is to be found the continuity between the 'matter of fact' of painting and the spiritual sensation of the eternity of time that is the sensation's logic. Through a close and detailed reading Darren draws out the special importance of Deleuze's Spinozist reading of the immanent spirituality of the modalities of the temporal made palpable through the non-human becoming of sensation.

Simon O'Sullivan's paper unravels the disruptive potentials brought about by the glitch or the stammer, from Deleuze and Guattari's idea of a minor literature, and the parallels between this and the potentials effectuated by the diagram. In both, he argues, we find the potential to counteract the sclerosis and confinements of regimes of signification as

well as the call 'for a future form, for a new earth and people that do not yet exist', something that characterizes the affirmative potential of contemporary art.

Like Simon's, my own contribution aims to create appositions as a strategy to draw correlations and disjunctions: to make concepts work. The paper sets up a four-fold arrangement of convergences and contradistinctions between 1) concepts from the general aesthetics to be found in Deleuze and Guattari's *What is Philosophy?* and *A Thousand Plateaus*, 2) the 'pack' Deleuze/Bacon, 3) Damien Hirst's early work, and 4) the state of the food production industry, exemplified by the phrase *becoming-packaging*. Through this, it becomes possible to test to what extent *The Logic of Sensation* reaches beyond the confines of painting, and whether Hirst's art disrupts its intense formalism.

The fundamental claim of Deleuze's book is that painting's logic of sensation is the paradigmatic form of the collapse of divisions and oppositions – such as those between figure and ground, the general and the singular, sensual particularity and abstraction – to create new sensual relations, pulsations in the folding of materials, of peoples and worlds, taking place on the plane of immanence. For Deleuze, the plane of immanence is 'the non-thought within thought . . . it is the most intimate within thought and yet the absolute outside – an outside more distant than an external world because it is an inside deeper that any internal world' (Deleuze 1994: 59–60).

Each of the following essays argues in its own way that what distinguishes this exceptional *folie à deux* is its power to produce encounters with the infinite potential of the perfectly liquid (folded and infinite) distributions of intensity of the plane of immanence.

Deleuze, Bacon and the Challenge of the Contemporary

Andrew Conio University of Wolverhampton

Abstract

This paper tests the aesthetic theory presented in *Francis Bacon: The Logic of Sensation* against the Foucauldian Turn in art in the 1980s and Damien Hirst's early artworks, in order to ask if the concepts taken from the more general aesthetics to be found in *A Thousand Plateaus* and *What is Philosophy?* are better suited to an understanding of contemporary art, before returning to the question of whether there is something truly significant at work in this *folie à deux* between painter and philosopher.

Keywords: Damien Hirst, becoming-packaging, sensation, thinking painting, the Foucauldian Turn

For Deleuze, Bacon's paintings achieve a *becoming-animal*, not through correspondences but through incarnations of traits, through 'meat' and through the creation of 'zones of indiscernibility' or 'undecidability' between man and animal that state the common 'fact' of both. This is all well and good, but while Bacon's 'meat' bears the suffering and pain of man, nowhere is 'becoming-animal' a state of repose, stillness or grace. Bacon's animals don't sleep, nurture or caress. In the pack 'Deleuze-Bacon', becoming-animal is a wretched affair, the animal emerging only through contortion and spasm. Only in scant references to birds and music do we find the richly and brilliantly colourful imagery of the individuations and singularities of melodic refrains. We have to look to *A Thousand Plateaus* for an outline of the melodic counterpoints of nature as *natura musicans*, as Deleuze constructs a phylo/ontogeny of becoming that has a distinct directional (albeit without structure or genesis, therefore diachronic and crystallising) impulse from the human to becoming-woman to

becoming-animal, and finally, to the higher deterritorialisation of becoming-imperceptible.

Bypassing its masculinism, *Francis Bacon*'s inherent evolutionary theory has plenty to say about the über-technological world of contemporary food production. Becoming-animal as an aesthetic project, and the 'privatisation' of food production, share the basic formula of evolution by contagion and alliance. Through the transgression of the boundaries of filiation transversal traits are to be found both in Deleuze's aesthetic theory and in the food industry's processes of selection. Both challenge the autonomy of entities and unities. In art, becoming-imperceptible is 'to reduce oneself to an abstract line, a trait, in order to find one's zone of indiscernibility with other traits, and in this way enter the haecceity and impersonality of the creator' (Deleuze and Guattari 1987: 280). In the privatised food production process, where the entire process of cellular division, selection, reproduction, husbandry, labour and marketing is geared towards only one outcome, becoming-molecular serves only the exploitative potential of the phenotypic trait in order to transcend the boundaries of descent by filiation. A process that can be captured by the phrase *becoming-packaging*.

Of course, becoming-animal in art and becoming-packaging are governed by two wholly different logics. The former forms a[n] (a-subjective) phenomenological 'becoming' governed by the logic of sensation and the modulation of heterogenic forces, while the latter emerges from the capitalist colonisation of life. Capitalism exploits, and despite its miraculous agency, that is its nature. And having exploited the reproductive process and colonised the virtual and the unconscious, it has now intensified its colonisation of the planet's species. A process elegantly captured by Eugene Holland;

> They argue that capitalism is able to continually displace any apparent limits to its growth by adding new axioms to its systems of axiomatization. Thus for example when biological and/or political limits appear as obstacles to the extraction of… surplus value… capital adds axioms of technology to increase productivity within the system of production so that more value… can be extracted… (Holland 1999: 114)

This appears to set up a conflict between, on the one hand, the heterogenic potential of organic life, society and human consciousness, and the crude expropriation of life's creative potentials by capitalist, machinic rationality. However, as Deleuze and Guattari tirelessly point

out, subjectivity is machinic and machines are often the non-human becomings of man.

> The plane of consistency of nature is like an immense Abstract machine, abstract yet real and individual; its pieces are the various assemblages and individuals, each of which groups together an infinity of particles entering into an infinity of more or less interconnected relations. There is therefore a unity to the plane of nature, which applies equally to the inanimate and the animate, the artificial and the natural. (Deleuze and Guattari 1987: 254)

And what more perfect example is there of man becoming more through the non-human becomings of a machine than cinema? The machinic is a site of becoming, or a threshold to many possible worlds, whilst nature itself operates on the basis of 'machinic phylogenetic becoming' (Ansell-Pearson 1997: 135).

What is clear in becoming-packaging, however, is that difference is indeed sought-after to create extra-ordinary new becomings, becoming scorpion/mushroom/corn, but the heterogeneity of germinal life has now been replaced by the repudiation of expansion, propagation, contagion or unnatural participations. Any trait that might serve the animal itself, any inconsistency or potential for anomaly is screened out and destroyed. Any attempt at a re-enchantment with the natural world, from wherever its source, is repudiated by the techno-sphere.

There are a number of clear difficulties in creating homologies between becoming-packaging and the Deleuze/Bacon coupling. We are dealing with fundamentally divergent worlds and further parallels would stretch the concepts to breaking point. Instead, we should perhaps ask if Damien Hirst's work responds to the logics of becoming-packaging that are symptomatic of capitalism's relationship with the entire life world. To do so, we must first situate Hirst's work within the broader terrain of Contemporary Art.

I. The Foucauldian Turn

Over the last thirty to forty years the ideas of Jacques Derrida (the 'trace' and *différance*), Jean Baudrillard ('simulacra', 'hyperreality', and the 'loss of the Real'), Jean-François Lyotard, (on 'the sublime' and Newman) Jacques Lacan (misrecognition), have proliferated, and their various interpreters (Owens 1992, Krauss 1993) have provided the philosophical balustrades for academic writing on art as well as an indispensable intellectual infrastructure for contemporary art practice. Despite having written relatively little on art,[1] Foucault's

influence on both the values that pertain to Contemporary Art and how those values are constructed and institutionalised, especially his disassembling of the notions of authorship and originality, has been considerable. This is exemplified by the *Sculpture Project Muenster* (2007), which encapsulated the degree to which sculpture has transcended the boundaries of the object and the formal concerns of modernism to become imbued in the social and political fabrics of architecture (Manfred Pernice), space (Pawel Althamer), desire (Mike Kelly), education (Maria Pask), corporations (Andreas Siekman), and of society's forgotten underclass (Valérie Jouve).

Foucault's works on the body, power and subjectivity are widely held to have made a major contribution to the reconfiguration of art practice and theory (Boyne 2002: 337–48). Together with his writings on the assignation of subjectivity, this was contiguous with new art practices that questioned authorship, individuality and the testing of the body's limits in the burgeoning performance art scene of the 1980s. The present paper, however, looks chiefly to Foucault's theory of discourses, the function of which are to organise signification, knowledge and material practices. These discourses – for example, those of madness, punishment and sexuality – regulate systems of rules for behaviour and knowledge as well as the domain of the discourses' own existence and their functions. Claims to truth, even when they are touchingly intimate or epistemologically or ontologically potent, are regulated according to rules that determine what can legitimately be called knowledge. And these claims for truth are codified into series of permissions and legitimations governing who can claim to make statements, the place from which they might be spoken, and their nature and object. We find, then, that the general terrain for much that is interesting in Contemporary Art is provided by an acute if implicit sensitivity to discourse formations and the potential of art to unravel hidden power relations, as well as the articulation of strategies to intervene in and disrupt their operations.

Instead of a search for the 'sublime' or the 'transcendental', in either its philosophical, quasi-spiritual or social forms, artists now seek to unravel power relations that sanctify the art object's various 'claims to truth'. Although this is by no means an exclusively Foucauldian project, Foucault was pre-eminent in his concern with how power and subjectivity are naturalised and how, because power operates in minute and seemingly unobtrusive ways, subjects are not necessarily aware that they are being trained or disciplined. This is a concern echoed in contemporary art practices that foreground the microstructures

of domination, not least in response to the transformation from a Disciplinary Society to the Society of Control, according to the logic of which power becomes anonymous and ubiquitous.

If the Foucauldian Turn provides the general milieu of Contemporary Art, artists are certainly acting in a way that confirms Foucault's hypothesis; if anything, they are challenging discourses by opening them up to the wider non-discursive forces from which they are formed, in ways that are interruptive, troublesome, dissonant. Moreover, many contemporary art practices can be understood as implicit critiques not only of the regulative functions of discourses, but also of the limits of a theory that attempts to determine what is inside and outside a particular discourse.

Deleuze departs from Foucault in devising a number of other more supple concepts to describe the formation of social bodies, including assemblage, milieu, and abstract machine. Deleuze is rarely interested in entities, no matter how transitory, or in describing their functions, domains, genus and so forth. His is a philosophy of flows, of pulsations, of becomings that are movements across discourses, logics, systems and epistemes.

Thus, whilst contemporary art practices articulate an implicit cognisance of discourses, Deleuzian strategies for the release of transversal becomings from the grip of whatever discourse is blocking, restricting or codifying the free-flowing potentials of life provide a richer loam for Contemporary Art. This leads to the basic distinction between Foucault and Deleuze: where Foucault is the archaeologist or genealogist of disciplinary practices, Deleuze, in asking other questions of affect and intensity, seeks to release desire from their grip.

II. Deleuze Studies Damien Hirst

Deleuze and Guattari's aesthetics of the 'bloc of affects and percepts' and the mounding of sensation into a *plane of composition* provides more mobile and shrewd terms for understanding the values of Contemporary Art. This can be demonstrated in relation to Damien Hirst's early works (this paper has no interest in the later works or the celebrity/speculator Hirst), with their commitment to issues of decay and mortality shared by humans and other species. In *A Thousand Years* (1990), the life cycle of the fly is staged as it changes from maggot to, in the unmistakable eloquence of brain Sewell, 'the breeding buzzing dying business of the blow fly', until finally brought to its indifferent end by the insecticutor. In *Mother and Child Divided* (1993), the viewer has the disconcerting

exemption to walk where no person should ever go,[2] between the divided corpses of a cow and a calf suspended in formaldehyde: pity the meat! *Affect* infuses the viewer through 'haptic eyes',[3] which are concurrently fascinated and repelled by the human capacity to turn living matter into nothing more than a facile exhibit for our aesthetic pleasure. The visceral shock to be had from walking between the sinews of once-living matter; the palpable tragedy of humanity's imperious and supercilious attitude to life; the terrible beauty of the division which transforms a sentient being into a textbook-like diagram of its own organs – these are *affects* combined in such a way as to create new relations of speed, proximity and intensity. Specifically, the calf's eye is now indefinitely open and its digestive process responds to the rhythms of spectatorship. Its organs no longer organise the differential processes that sustain life, but create a macabre body without organs. These incommensurable durations are recomposed to create a new achromatic time associated with becoming, instantiated by the artwork itself.

In becoming-packaging little space is allowed for individualism. People and animals play merely supporting roles in the logistics of a system that sustains society's standard of living. Yet, in *Mother and Child Divided* both are given new roles as the viewer's soul is reinserted in the machinic. The viewer is invited to disentangle naturalised relationships between food production, labour, consumption, scientific objectivity, biology and mythology (it is *Mother and Calf* divided). The precision and instrumental rationality of becoming-packaging is refracted in the sculptural precision of the frames, the glass and suspension, not as perceptions but as the rendered perceptible of the 'imperceptible forces that populate the world, that affect us and make us become' (Deleuze and Guattari 1994: 172).

To be precise, Hirst stages these sculptural soliloquies upon matters of life and death with explicit reference to the minimalism of Sol LeWitt and Donald Judd, while the title *The Physical Impossibility of Death in the Mind of Someone Living* (1991) adopts the playful conceptualism of Michael Craig Martin. Hirst shares with most Young British Artists an adoption of only those dimensions of conceptualism Kosuth dismisses as 'stylistic' (as opposed to 'theoretical') Conceptual Art, or that which Art and Language would dismiss as idealistic and self-mythologising. A clear distinction cannot be manufactured between the concepts of Conceptual Art and Deleuze's percepts. Not least because the definition, practices and practitioners, geography, role and legacy of Conceptual Art cannot be adequately described by a single term that covers linguistic, dematerialising and performative practices – or

indeed practices that are embedded in analytical philosophy (Kosuth), or the imperatives of institutional (Daniel Burren) or social critique. Notwithstanding this, in any of its diverse formulations Conceptual Art lacked the conceptual tools necessary to articulate the distinction between concepts, percepts and affects. As Deleuze and Guattari say: 'conceptual becoming is the action by which the common event itself eludes what it is' (Deleuze and Guattari 1994: 177). We can situate Hirst's works outside the interminable and unsatisfactory debate over what constitutes valid Conceptual Art, since his (albeit early) artworks do not just present concepts in another form, they think through percepts, percepts that are not given and 'represented' but are reconfigured in such away as to create a new type of thinking; that is, in the manner of art's distinctive character. This may sound similar to Kosuth's formulation of 'art as philosophy', but what distinguishes Deleuze's aesthetics from any formulation of the conceptual in its general privileging of the role of the idea over sensual particularity is his emphasis on the central role of sensation in the moulding of percepts and affects into a plane of composition.

In Hirst's early works, the conventions of the gallery, the consequences of the Foucauldian Turn, and the dynamics of social forces and epistemological struggle are not illustrated or represented. Instead, dynamic *rhythms* issue from newly forged, embodied relationships between the legacy of conceptualism brought into a new contrapuntal relationship with the intensities of decay, mortality and despair. These works undo the propositional nature of signification by bringing distinct and differentiated pulsations into a new relationship. And, precisely because they are distinct modalities of experience, the act of bringing them together creates disjunctive and conjunctive pulsations, pulsations that are, in sum, refrains. As Ronald Bogue notes: 'The refrain is the differential rhythm constituted in milieus, the relation between milieu components . . . their contrapuntal *relation* is the refrain' (Bogue 2003: 74).

This creates not a Greenbergian autonomy of art but a relative autonomy from the sedimented, axiomatic forces of restriction that reduce life to organised and finite manageable units. And crucially, the *metrical* rhythm of becoming-packaging is detached from its source and transformed into a transversal rhythmic component of the milieu. Meter is substituted with the pulsations of augmentation and diminishment, the amplification or elimination of pure sensations imbricated in the artworks themselves.

Both Bacon's and Hirst's work exude rhythmic pulsations and refrains that undo the usual tropes of figuration. According to Deleuze, Bacon's

figures are composed of systolic and diastolic rhythms, ascending and descending pulsions. Hirst's 'Figures' emit rhythms of contraction and release in the embodied participation of viewing, walking by, standing near, and perceiving sculptural forms; through images that are more filmic than painterly his work releases new virtualities from their material by the contrapuntal refrains mentioned above. Hirst's and Bacon's works can be understood equally well in terms of refrains, the difference being that while Hirst moulds out of already clichéd and coded materials, Bacon moulds out of pure intensities. In both, these melodies have the de- and re-territorialising effects of fashioning new territories, allowing expressive components to create a shock to thought.

Whilst each artist – and here we begin to cleave the two apart – creates a phenomenological engagement with their respective objects, in the case of Hirst, this is no more than a repetition of the common or garden mode of the reception and experience of art objects, consumer goods and artefacts. Hirst's significations are of the type Deleuze associates with Peirce: 'Icons defined by similitude and "symbols of conventional rule" ', (Deleuze 2003: 116), in short, spectatorial signs. Hirst's sensations *are* palpable, but, reading from *The Logic of Sensation*: 'narrative or symbolic figuration obtains only the bogus violence of sensation' (Deleuze 2003: xiv). They do not mobilise a more profound level of sensation, of sensations that reveal, or better *are*, as *matters of fact*, new forms of thinking. The implication of this distinction is made clear by Deleuze: 'When Bacon distinguishes between two violences, that of the spectacle and that of the sensation, and declares that the first must be renounced to reach the second, *it is a kind of declaration of faith in life*' (Deleuze 2003: 61, emphasis added).

However, this argument can be turned around to suggest that Hirst's work presents a challenge to Bacon's intensive phenomenology. Such is the intensity of the paintings – in which flesh and meat and subjectivity are enraptured by the energetic combat of the flaying pulsations of ascending and falling rhythms – that the exegesis of the political, social and physio-biological are pushed off the canvass, to become the *social unconscious* of the painting. In this age of becoming-packaging all asignifying, alogical pulsations of life are already codified. This is no longer the age of the spirit – pig-spirit, buffalo-spirit, dog-spirit, bat-spirit – as the pure animal spirit of man is already stratified and coded. These primal forces enter into society commodified, organised and subject to whatever regime of thought (medicine, jurisprudence, education) predetermines their being. This chimes with the art practices

of many leading contemporary artists from Jeremy Deller to Michael Landy, from Gordon Matta Clark to Mike Kelly, who no longer deal with pure experience but with rhetorical strategies such as synecdoche, synonym, metonymy and syllepsis applied to objects and images rather than language to invert the naturalised 'order of things'.

Arguably, for all its inventiveness and social critique, Contemporary Art merely reconfigures regimes of signs, using what Daniel Smith describes as 'techniques of graphic representation of intelligible relations or coordinates' (Smith 2003: 43). Bacon's position is essentially eccentric to the modern world and its concerns; which leads to a claim, to be referred to below, that may sound extraordinary to non-Deleuzian ears, namely, that Bacon's *forces* are those of the universe, of absolute territorialisation and abandonment to the plane of immanence.

III. The Diagram

The diagram is by no means unique to art but Deleuze gives it a specific role in painting. The diagram has two parts, the catastrophe and the modulating function. Whilst Bacon is embedded in the force of the catastrophe, Hirst follows the postmodern tradition by showing little concern with the forces of pure chaos or collapse. Firstly, however, we should bear in mind that Deleuze's description of the collapse in *The Logic of Sensation* is ambivalent. On the one hand it is *not* the pure collapse of a fall into an abyss, it is a highly systematised and specific collapse from representation and figuration. And the catastrophe is methodologically operative through challenging the supremacy of the eye with the hand, and through particular marks, scrubbing, smearing and rubbing out. Hence, for Deleuze, the 'diagram must remain localised in space and time'. On the other hand, in the 'emergence of another world', the catastrophe is also the catastrophe of 'being' (Deleuze 2003: 159). This is not psychological collapse but, according to Deleuze, one brought about by forces of 'pressure, dilation, contraction, flattening, and elongation', which are 'like the forces of the cosmos confronting an intergalactic traveller immobile in his capsule' (Deleuze 2003: 58). We have seen this correlation of the local action of matter on the canvas with the vital movement of cosmological forces worked out at its farthest and nearest reach in Deleuze's description, taken from Spinoza, of a Universe's diastolic and systolic movements and planes of various speeds and slownesses, all in relation and variation in the creation of refrains – the *natura musicans* discussed above.

The diagram modulates not just concepts or significations, clichés or order-words; its first principle is manual in the creation of modulations between 'haptic world and haptic sense'. In this way, Deleuze argues, the diagram creates a more profound resemblance than any produced through figuration, abstraction, and by implication, conceptual art. Hirst's compositions of deterritorialised stratifications and axioms are only embodied to the extent permitted by the highly conventionalised modes of reception of the artwork in the gallery system. The fundamental difficulty in transposing the diagram from Francis Bacon to Damien Hirst is that Hirst's work is a continuation of already embedded systems of thought by other means. In contrast, the diagram 'overturns the optical co-ordinations' and 'figurative coordinates' that Hirst accepts. The diagram's work is more fundamental; it introduces or distributes forces, and it places forces in relation, modulating them in order for something to emerge from it, 'if nothing new emerges . . . it fails' (Deleuze 2003: 159). In short: it would be an act of conceptual vandalism to apply the diagram to Hirst's work.

It is of note that the diagram is an iteration of the same basic design found in all of Deleuze's work. In none of his differential systems of thought is Deleuze a philosopher of pure unbridled chaos. All of his books are concerned in some sense with the same issue: how to gather the heterogenic forces of difference in a contraction, territory, milieu, assemblage or abstract machine so that they retain their extreme openness yet become operative or, more importantly, productive. In this vein, Elizabeth Grosz talks of 'networks, Field and territories that temporarily and provisionally slow down chaos' (Grosz 2008) in our case the diagram and the Figure are the operative terms in relation to painting.

IV. Sensation

As is to be expected, it is in terms of sensation that the real distinction between Hirst and Bacon is to be found. Whilst Hirst's viewers may experience intense sensations these cannot be classified as pure sensation because Sensation transcends apperception by either mind or the body. As such, sensation is not the property of an object itself (it is not the 'redness' of the apple), or of the facility of the eye's cones and rods to perceive colour; it is rather the infinitive 'to redden', or, in the case of Francis Bacon, it is the *scream itself*. As sensation is not the attribute or quality of an object that acts either as sensation's substantive or

predicate, it is the action (the change in direction and intensity) by which something or someone ceaselessly becomes other; it is, in short, valence.

This does not imply that sensation is somehow non-attributable. Sensation flows through actual objects; it has to be, in some sense, palpable. James Williams has adroitly summarised this recently and in a way that resonates with the approach of this paper: 'Sense flows through actual things, sense changes all things. For example, when a species is extinct, the sense of that changes the whole world forever. When sense changes the senses of past and present, all senses are changed at once' (Williams 2008: 8).

Once sensation is released from the domain of the subject, because its properties are no longer in service to the assignation of subjectivity, it becomes logically ineluctable to ascribe sensation to the world beyond the subject. Life itself (with this, Deleuze also includes the inorganic) is an endless flux of pulsions, of rhythmic counterpoints, individuations, haecceities and events, all in endless relation far beyond the domain of man. It is only our species that perceives of its relatively frugal (although miraculous) portion of life and the world through its own image. Whereas, in the world, when song relates to flesh, sea to wind, machine to organism, each of these relations are relations of sense. Here is Deleuze and Guattari: 'the being of sensation is not the flesh but the compound of nonhuman forces of the cosmos, of man's nonhuman becomings, and of the ambiguous house that exchanges and adjusts them, makes them whirl around like winds' (Deleuze and Guattari 1994: 183).

One of Deleuze's significant disagreements with phenomenology concerns the nature of thinking. For phenomenology, the entwining of the subject and world means that consciousness is co-enacted with the world. However, as subtle as this might be (and I attend to the consanguinity between Deleuze and the Merleau-Ponty of *Partout et nulle part* elsewhere), phenomenology ultimately looks to this folding to explain the endowments of consciousness and the domain for a 'natural perception' in the world that is tied to the experiencing subject.

The restatuation of what it means to think, rather than the nature of consciousness, is of pre-eminent concern for Deleuze. In different ways, each of Deleuze's works raises the question: what does it mean to think? He displaces thinking from the thinking subject to the world that thinks through its relations and variations. This is not an image of thinking as a purely cognitive process, or even as an 'enfleshed' thought, it is the non-human thinking of the world itself. According to Deleuze, the expressions of milieu components in the creation of a territory – the contraction of the mollusc, the reaction of the plant to the sun – are all

forms of thinking. And thought is not limited to nature: ATMs; mobile phones, stock markets all develop consistencies and potentials, in short, they share autopoietic characteristics. As Keith Ansell-Pearson notes: 'an autopoietic machine is one which continuously generates and specifies its own organisation through its operation as a system of production of its own components' (Ansell-Pearson 1997: 140–1).

What painting offers is the paradigmatic form of thinking through sensation; 'all begins with sensibility: it is always through an intensity that thought comes to us', says Deleuze (Deleuze 2004: 182). This is an encounter and commingling of the forces and rhythms of world, materials, thinking and sense. In this way painting addresses its own problems, distinct from other arts or other domains (science/philosophy), through the sensations it intensifies and the variations and relations between sensations it creates.

Painting is paradigmatically, a-subjectively, phenomenological and carnal; carnal in its mode of production and carnal in its mode of reception. But this alone does not make it the exemplary mode for the expression of sensation. What does is painting's capacity to interlace materials, bodies, affects and percepts in such a way as to re-substantiate, as a 'matter of fact', the non-human becomings of man through sensation.

However, a note of caution needs to be raised lest sensation becomes hypostatised as the apeiron of life. Deleuze and Guattari answer their own question in *What is Philosophy?*: 'can sensation be assimilated to an original opinion, to *Urdoxa* as the world's foundation or immutable basis?' (Deleuze and Guattari 1994: 179). As we have noted, Deleuze and Guattari's works consistently illustrate interest in the things that *modulate* the zones of indeterminacy, whilst maintaining the most intensive potential for absolute deterritorialisation.

With this in mind, we can now revisit the claim we made earlier, that something truly exceptional emerges through this *folie à deux* between Deleuze and Bacon. This concerns what for the non-Deleuzian is the most fanciful aspect of Deleuze's ontology. That is his attempt to connect thinking, experience and sensation to the infinite: to elaborate body and universe, finite and infinite, cosmos and chaos, as folded, co-enacted and consubstantial. For Deleuze the artist is someone for whom there is something 'unbearable' in life, who senses 'the mutual embrace of life with what threatens it' (Deleuze 1994: 171). As such, through its truly eccentric relationship with the *regimes of signification* of the modern world, by embracing invisible chaotic or cosmological forces, painting is

able to use its own material practices to disrupt and confront habituated modes of thinking, experiencing and sensing.

This abandonment does not function without disjunction, intervals and interruption, as Bacon casts himself adrift to adopt the role of the anomalous. As such, Bacon's practice is apolitical only if politics is already aligned with power's own representation of itself; that is, a politics that repudiates the idea that cosmological, geological, infinite transcendental forces are part of our lives. Against power's self-determination, painting is able to offer a remodelling of the potentials of thought to enable the phrasing of the questions: what does it mean to think? what is thinking within the dominions of the abyss, chaos and the universe as expansions and contractions are weaved through bodies, concepts and materials? These are not asked so that an answer might be given, but so that the potentials of thought might be revealed. As Claire Colebrook says: 'The task of thinking is not to establish the truest or highest world but to think the multiplicity of perception that unfolds in divergent worlds' (Colebrook 2006: 139).

That is to say, what is it about a particular art form and the way it poses its own problems that gives to its form of 'thinking' its own conditions of possibility? As Deleuze is not a philosopher of moribund concepts or dry abstractions but of incitations to creative and experimental activity, the modest aim of this paper has been to do just that: produce new alignments of thought through the apposition of the food production process encapsulated in the phrase becoming-packaging, Damien Hirst's early works, and the pack Bacon-Deleuze.

Notes

1. For example, the chapter 'Las Meninas' in *The Order of Things* (Foucault 1982), and *This is Not a Pipe* (Foucault 1973).
2. Literally billions of animals are divided in abattoirs, but the specific capacity of art to decode and recode affects has the effect of making this palpable, bringing to our senses what has become invisible, or unconscious, the privatised nature of mans relationship between himself and species.
3. The eyes that feel the surface of the visible.

From Stuttering and Stammering to the Diagram: Deleuze, Bacon and Contemporary Art Practice

Simon O'Sullivan Goldsmiths, University of London

Abstract

This article attends to Deleuze and Guattari's idea of a 'minor literature' as well as to Deleuze's concepts of the figural, probe-heads and the diagram in relation to Bacon's paintings. The paper asks specifically what might be usefully taken from this Deleuze–Bacon encounter for the expanded field of contemporary art practice.

Keywords: Francis Bacon, figural, diagram, contemporary art, minor literature, probe-head

I. Minor Literature

Deleuze and Guattari's concept of a minor literature (at least as it is laid out in *Kafka: Towards a Minor Literature* from where the following definition has been condensed [see Deleuze and Guattari 1986: 16–18]) involves three components: 1. The foregrounding of the affective and intensive quality of language or its operation on an asignifying register. A minor literature stutters and stammers the major. It breaks with the operation of 'order-words'. It 'stops making sense'. 2. The always already political nature of such literature. A minor literature is always connected to the wider social milieu and not fixated on the domestic/Oedipal. 3. Its specifically collective character. A minor literature is always a collective enunciation. In fact, a minor literature works to pave the way for a community – sometimes a nation – yet to come. This is a minor literature's future orientation.

Each of these components of a minor literature, I would argue, can be 'applied' to contemporary art practice (and I think operate as a corrective to any simple affirmation of 'the new' as it is incarnated in the

commodity form). Elsewhere I have attended to the third point above, which seems to me to be a particularly useful way of thinking through many of the most interesting of today's art practices and their mode of effectivity, as it were. To briefly repeat that point here: such practices are not made for an already existing audience, but to call forth – or invoke – an audience. They do not offer more of the same. They do not necessarily produce 'knowledge'. They do not offer a reassuring mirror reflection of a subjectivity already in place. With such art 'the people are missing', as Deleuze might say. In fact, I would argue, the operating field of these practices can be thought of as the future and, as such, the artists in question here operate as kind of prophets. We might even say *traitor* prophets, in so far as they perform a treachery in relation to our more dominant affective/signifying regimes (that is to say, consensual reality).

All of this gives such art a utopian function inasmuch as part of its being is somehow located elsewhere. Importantly, and following Deleuze, and Deleuze and Guattari, we can understand this as a specifically *immanent* utopia – intrinsically connected to the present, made out of the same materials, the same matter (after all what else is there?) but calling 'for a future form, for a new earth and people that do not yet exist' (Deleuze and Guattari 1994: 108). This last quotation is from an argument Deleuze and Guattari make in relation to philosophy, and to the creation of concepts; however, it seems to me it is equally applicable to a minor literature, and indeed to contemporary art practice (not least given the fact that art practice post-Duchamp has increasingly concerned itself with the conceptual, and indeed, in some cases, with the invention of concepts). In passing, I think we could make the argument that Bacon's paintings are traitor paintings in this sense. Certainly they are *different* to the other objects that surround us and constitute our everyday habitual milieu. Bacon's paintings might also be thought of as future-orientated in that they are not merely of the present in the sense of being easily readable by our present subjectivity as it is. They call something forth from within us, in fact something that is not just another reading/interpretation of the paintings in question. This affective response or reaction might involve a certain interest or excitement, a point of inspiration perhaps (and Spinoza's notion of a productive, joyful encounter would be pertinent here), but it might also be a certain horror or disgust, even an irritation or boredom. These last two often mask the fact that something has been encountered that in some way challenges a given subjectivity. They operate as defensive mechanisms. As far as art goes reactions such as these might indicate that we are at a limit point or edge – and that if we can stay with these uncomfortable affects then

something, finally, might happen. We might say then that this future orientation of art as I have been calling it opens us up to what we might *become*.

So much for this third modality of a minor literature. Below I want also to focus on the first characteristic of the latter – its operation on an intensive register. To repeat, for Deleuze and Guattari, a minor literature foregrounds asignification or simply the intensive aspects of language. It counteracts the operation of order-words and the exercise of power this involves by breaking language open to a howling outside/inside. It is these moments of noise – or glitches as we might call them – that free language from itself, at least, from its signifying self, by putting it into contact with other forces. This is an experimentation with, and from within, language. A rupturing of representation. A breaking of the habit of 'making sense', of 'being human'. We can perhaps begin to see here the connections with Bacon.

In more technical terms, such a stuttering and stammering of language operates to produce what I would term an affective-event that in itself can produce what Guattari calls a 'mutant nuclei of subjectification' and thus the possibility of 'resingularisation' (a reordering of the elements that make up our subjectivity) (Guattari 1995: 18). In fact, when attending to this event in his own writings Guattari turns to Mikhail Bahktin and writes of the 'detachment of an ethico-aesthetic "partial object" from the field of dominant significations' that 'corresponds both to the promotion of a mutant desire and to the achievement of a certain disinterestedness' (Guattari 1995: 13). The partial object here operates as a point of entry into a different incorporeal universe. A point around which a different kind of subjectivity might crystallise. Crucially, and as Guattari remarks, this operation must involve a certain disinterestedness (Guattari is indebted to Kant in this sense). We might say that the listener – or spectator – must respond to the glitch, the affective-event, *as* an event, as the bearer of the potentiality of something else. Put simply, one must, in order that this procedure work, be open to the possibility of something different occurring. This, I think, is crucial. The artwork – or the work that art demands of us – involves an active engagement, a *participation* as it were. Without the latter even the most seemingly radical work will remain inoperative. The glitch then, I would argue, is co-produced through object and subject – in fact, it names a passage between the two. This last point would be to bring Guattari's expanded notion of art briefly laid out above, and indeed the central notion of becoming in *A Thousand Plateaus*, into conjunction with the apparently more conservative 'version' of art given in *What is Philosophy?*, where

art is seen as precisely the place of 'a passing between things'. As Deleuze and Guattari remark in the latter volume: 'Life alone creates such zones where living beings whirl around, and only art can reach and penetrate them in its enterprise of co-creation' (Deleuze and Guattari 1994: 173).

Deleuze and Guattari's work on the notion of a minor literature and specifically, here, the necessity of stammering and stuttering a major language, or the foregrounding of what I have been calling the glitch, is then a highly productive text for thinking the field of contemporary art in its conservative and in its more expanded form (we might say, within painting [as we shall see with Bacon] but also within video for example [that often stutters and stammers 'reality' and indeed the major language of film]). Such affective stammering operates as a kind of singularity that in itself counteracts already existing affective/signifying regimes, whilst at the same time, crucially, opening up a gap within these all too familiar series and circuits of knowledge/information. A gap which we might also configure here as a form of non-communication. This is to bring art close to what Deleuze calls (and calls for), in his 'Postscript on Societies of Control':

> Maybe speech and communication have become corrupted. They're thoroughly permeated by money – and not by accident but by their very nature. Creating has always been something different from communicating. The key thing might be to create vacuoles of non-communication, circuit breakers so we can elude control. (Deleuze 1995: 175)

Art is not, I would argue, ultimately concerned with knowledge – or, at least, with what passes for knowledge within our everyday knowledge-economy (simply, information). It is not 'useful' in this sense. Indeed, even those so-called art practices that seek to produce *counter*-knowledge can become caught by the very thing they attempt to work against. Such practices necessarily have to work on the same terrain as it were – and thus utilise the same terms. Art, it seems to me, might be better thought of as an event that interrupts knowledge – that breaks information. In fact, art is one of the very few things we have left that is able to creatively make this break.

We might also understand these moments or rupturing events in Bergsonian terms as opening further the gap between stimulus and response that defines us as human (the complexity of the nervous system, which allows a multiplicity of different pathways for stimulus-response, determines a hesitation – or gap – in that response). This is to identify a certain slowness, even a stillness, which might work against the incessant speed of contemporary 'life'. For Bergson, this gap opens us up to the

pure past – a kind of ontological background to ourselves. It is through this gap that we become creative rather than reactive creatures (see Bergson 1991: 101–2). This is the very definition of freedom, at least freedom from habit or simply the (impasses of the) present plane of existence.

Another way of understanding this potential of the glitch – following Guattari – is that it operates as a point of indeterminacy, and, as such, opens up the possibility of a multiplicity of subsequent pathways and thus a multiplicity of possible worlds. We might say in fact that the glitch always contains within it the germ of a new world. Indeed, I would argue, it is this functioning as a point of indetermination that gives much contemporary art its inspirational, we might even say hopeful tenor. Such glitches – or breaks in the typical – are a kind of reverse-technology in that they offer an escape from the manipulation performed by those other affective assemblages that increasingly operate in a parallel logic to art. I am thinking here of the complex utilisation of affect, specifically by the mass media that increasingly operates on a self-consciously affective register – as a kind of nervous system – utilising the temporally indeterminate aspect of the event in an ever expanding exercise of power (what we might call a politics of pre-emption, or simply, the colonisation of the virtual).

We might say then that the glitch names two moments or movements. To break a world and to make a world. In fact these two are never really divorced from one another: to dissent means invariably to affirm some where/thing else. To affirm an elsewhere we have to turn from that which is already here. The glitch is then a moment of critique, a moment of negation – but also a moment of creation and of affirmation. Indeed, the glitch – in whichever regime it operates and ruptures – is the 'sound' of this something else, this something *different* attempting to get through. To end this first section then, we can return to the artist as the one who specifically uses this logic of the glitch. The artist as traitor prophet names a twin orientation: the betrayal of one world and the affirmation of a world-yet-to-come.

II. Deleuze-Bacon

I want now to shift sideways, before returning to this idea of stuttering and the glitch, and look at Deleuze's book on Bacon and at a number of concepts Deleuze 'invents' there to think Bacon's paintings. As with the above section I am particularly interested here in how these

concepts – and the paintings – attempt to undo representation, and how we might extend their workings to the field of contemporary art in general.

Firstly then, the *figural*. The figural for Deleuze-Bacon is that which deforms, or does violence to, the figurative. We can understand the latter here as the typical way we are represented and represent ourselves within the world. Those forms that reassure us of our identity. Indeed, for Deleuze, representation is not solely a type of art, as it were, but the very means by which we constitute ourselves as an organism and as a subject in the world. To quote Deleuze:

> If representation is related to an object, this relation is derived from the form of representation; if this object is the organism and organisation, it is because the form of representation is first of all organic in itself, it is because the form of representation first of all expresses the organic life of the man as subject. (Deleuze 2003: 126)

The figural achieves this disruption, firstly, through a mechanism of isolation. The figure is presented as a 'matter-of-fact', detached from narration or any illustrative function. To quote Deleuze again:

> Isolating the figure will be the primary requirement. The figurative (representation) implies the relationship of an image to an object that it is supposed to illustrate; but it also implies the relationship of an image to other images in a composite whole which assigns a specific object to each of them. Narration is the correlate of illustration. A story slips into, or tends to slip into, the space between the two figures in order to animate the illustrated whole. (Deleuze 2003: 3)

Isolation then is a method for breaking with a certain use of images in our world – the way in which they tend to be mobilised for a certain end, almost always to sell us something (witness advertising). In passing, and with a nod to Guattari's writings on the Readymade, we might expand this requirement of isolation out to the wider field of contemporary art in general. An object might be detached from its habitual mode of circulation and specifically its position within capitalist relations of exchange. We might say simply, that it is, in one sense, rendered inoperative, placed as it is within the frame of art.

However, to return to Bacon, this isolation is only one moment in a process, for the isolated figure also operates as a point of departure for deterritorialisations, for a moving beyond the figure. In this sense the figural is a kind of in-between the figurative and the non-figurative. Put differently, the figural involves a *becoming* of the figure. A becoming-animal ('in place of formal correspondences what Bacon's painting

constitutes is a *zone of indiscernability or undecideability* between man and animal' [Deleuze 2003: 21]), and ultimately a becoming-imperceptible ('whatever its importance becoming-animal is only one stage in a more profound becoming-imperceptible in which the figure disappears' [Deleuze 2003: 27]).

To return to my digression on the Readymade, and following Guattari once more, we might say that the object isolated from a given series works as a trigger point to open up other 'incorporeal universes of value' (and no doubt, given the increasing emphasis on productivity and speed within our information age, this isolation and opening will involve the type of slowness I mentioned above). Hence Guattari's understanding of the Readymade – laid out in his essay 'Ritornellos and Existential Affects' – as that object which has been taken out of a normal series thus allowing the latter to be put to work in a different manner:

> Marcel Duchamp's *Bottlerack* functions as the trigger for a constellation of referential universes engaging both intimate reminiscences (the cellar of the house, a certain winter, the rays of light upon spider's webs, adolescent solitude) and connotations of a cultural or economic order – the time when bottles were still washed with the aid of a bottle wash . . . (Guattari 1996: 164)

It is this power of art to access these other universes and other times away from a narrow and alienated present that, we might say, is the *time of art*.

Secondly, *probe-heads*. We can see the above becoming-animal in relation to Bacon's treatment of heads where, in the terms of *A Thousand Plateaus*, Bacon attempts to disrupt the processes of faciality, understood here as that abstract machine of modernity that produces signifiance (the white wall) and subjectification (the black hole). To quote Deleuze and Guattari from the latter volume:

> if human beings have a destiny, it is rather to escape the face, to dismantle the face and facialisations, to become imperceptible, to become clandestine, not by returning to animality, nor even by returning to the head, but by spiritual and special becomings-animal, by strange true becomings that get past the wall and get out of the black holes. (Deleuze and Guattari 1988: 171)

Bacon's heads are probe-heads in this precise sense, lines of escape from the face and from faciality. Crucially, they are not a return to some kind of primitive pre-faciality. They are in fact an escape that takes place from within the terrain of the face itself, a kind of stammering from within. Of course, probe-heads need not necessarily be pictures of heads but rather any device that disrupts faciality, for the latter applies not

just to heads but to all of the mechanisms that produce signifiance and subjectivity (from faces and landscapes within painting to facialisation and lanscapification within the world). To quote Deleuze and Guattari once more:

> You will be pinned to the white wall and stuffed in the black hole. This machine is called the faciality machine because it is the social production of the face, because it performs the facialisation of the entire body and all its surroundings and objects, and the landscapification of all worlds and milieus. (Deleuze and Guattari 1988: 181)

A probe-head is then that which explores the terrain beyond the face, the terrain from which the face is nothing more than an extraction or crystallisation. Probe-heads are in this sense a move into chaos. Probe-heads are those devices 'that dismantle the strata in their wake, break through walls of signifiance, pour out of the holes of subjectivity, fell trees in favour of veritable rhizomes, and steer the flows down lines of positive deterritorialisation or creative flight' (Deleuze and Guattari 1988: 190). They are, however, not just destructive, but, as the name suggests, productive of other, stranger and more fluid modes of organisation: 'Beyond the face lies an altogether different inhumanity: no longer that of the primitive head, but of 'probe-heads'; here, cutting edges of deterritorialisation become operative and lines of deterritorialisation positive and absolute, forming strange new becomings, new polyvocalities' (Deleuze and Guattari 1988: 190–1). As well as being a name for Bacon's portraits (and indeed his other paintings), 'probe-heads' might also be a useful name for more experimental, non-traditional art practices, or indeed for other practices – of living differently – not normally considered 'art'. Such practices might not seem to be de-facialisations, but with the systems of facialisation becoming increasingly complex (one thinks here again of the mass media and especially of new communications technologies) then the lines of flight from these will themselves become increasingly complex and unfamiliar, as will the territories produced on the other side of the 'white wall'. A case study of this new production of subjectivity might be collective and collaborative practices, those that deliberately dissent – or simply turn away from – the production of individualist and atomised subjectivities and other typical capitalist formations.

Importantly, probe-heads do not arrive from some other place. They are in fact made from the same stuff as faces. Indeed, we might say that the same (capitalist) machines that produce probe-heads also produce faces. The latter being subjectivities and assemblages that are 'useful',

the former often appearing as redundancies or dead ends. We have here a definition of sorts of art: it involves a kind of super-productivity arising from what appears, on the face of it as it were, to be non-productive.

Third, and finally, the *diagram*. For Deleuze-Bacon it is the diagram that enables this deterritorialisation of the face and the production of the 'body without organs' (the latter understood here as that which lies 'under' the organism/organisation [Deleuze 2003: 50]). In painting, and specifically Bacon's painting, the diagram involves the making of random marks that allow the figural to emerge from the figure. 'The diagram is . . . the operative set of asignifying and nonrepresentative lines and zones, line-strokes and colour-patches' (Deleuze 2003: 101). We might apply this rule of the diagram to other kinds of modern and contemporary art – practices that necessarily involve this play with chance, this contact and utilisation with that which goes beyond conscious control, if only to circumnavigate the reproduction of just-more-of-the-same. It would be an interesting project to identify how specific artists incorporate this lack of control 'into' their practice, or simply, how they contact and somehow 'use' that which is outside them 'selves'. How, for example, they might mobilise chance (and perhaps error) in the production of something new.

Here random occurrences are ontologically constitutive of art (and not an accident that befalls it). Indeed, an art practice – rather than a practice that just produces products – is always open to an outside in this sense. It needs to have a certain cohesiveness and form, but equally must be able to access a certain formlessness, as it were (simply put, it must have points of collapse). It is in this sense that art can never be wholly predetermined or worked out in advance but must involve this productive encounter with chaos (it is also in this sense that the artist seeks to make work that speaks back to him or her, as it were, or, in the painter Gerhard Richter's terms, 'that something will emerge that is unknown to me, which I could not plan, which is better, cleverer, than I am' [Richter, quoted in Gidal 1993: 47]).

The diagram is then 'a chaos, a catastrophe, but it is also a germ of order or rhythm. It is a violent chaos in relation to the figurative givens, but it is a germ of rhythm in relation to the new order of the painting' (Deleuze 2003: 102). The diagram is rhythm emerging from chaos, the manipulation of chance to suggest the 'emergence of another world' (Deleuze 2003: 100). Again, all sorts of art practices might be said to produce rhythmic worlds in this sense, worlds hitherto unseen but always produced from within the seen. Art is the production of worlds (the figural) that sit between that which is known (the figurative) and

that which is unknown (chaos): 'the law of the diagram, according to Bacon, is this: one starts with a figurative form, a diagram intervenes and scrambles it, and a form of a completely different nature emerges from the diagram, which is called the Figure' (Deleuze 2003: 156). Art, when it really is art, is always located at the edge of things in this sense. It faces, as it were, in two directions. It is a bridge, or again, a *passage* between.

This is, however, not all without its dangers. Indeed, for Deleuze-Bacon there are two 'wrong' positions as it were, which the middle way of the figural must avoid. Figuration (narration and illustration, which is to say representation), but also the *absolute* deterritorialisation of the figure (the move to total abstraction). We might call these the twin dangers of moving *too* slow – of remaining within representation – but also of moving too fast and ultimately following a line of abolition. Figuration operates through *cliché*, understood as that which surrounds us everyday: 'We are besieged by photographs that are illustrations, by newspapers that are narrations, by cinema-images, by television-images' (Deleuze 2003: 87). These are the clichés – physical, though there are also psychic ones ('ready-made perceptions, memories, phantasms' [Deleuze 2003: 87]) that fill the canvas even before the artist has dipped his brush (for Deleuze-Bacon, unlike Clement Greenberg for example, the canvas is not empty, but always already full, teeming as it were with virtualities). Another way of understanding these clichés is as habits; habits of sight – and also of thought. Art opposes the latter with its own logic of difference.

The other way, abstraction, can be divided further into two tendencies: 1. Pure or geometric abstraction, which elevates the optical and ultimately returns to figuration inasmuch as it contains a code (visual and spiritual) or, to say the same differently, passes through the brain (as is the case, Deleuze argues, with Kandinsky) (Deleuze 2003: 104–5). In this regard, the same criticism can be made against both figurative painting and abstract painting: 'they pass through the brain, they do not act directly on the nervous system, they do not attain the sensation, they do not liberate the Figure – all because they remain at *one and the same level*' (Deleuze 2003: 36). This is a signifying art waiting to be read. 2. Action painting, as paradigmatically the case with Jackson Pollock, that provides an all-over diagram (a purely haptic space) but in so doing, according to Deleuze-Bacon, loses its capacity to act on our nervous system (such painting is not controlled enough) (Deleuze 2003:109). The figural avoids these, although it is, according to Deleuze, no less radical in its own path.

In concluding this second part of my paper we might say then that the figural involves a not-too-fast but also a not-too-slow deterritorialisation of the figure – a rupturing of the latter so as to allow something else to appear, or to be heard 'behind' the figure as it were. The figural might seem less radical than other avant-garde techniques, other attempts at bringing art into life (one thinks here of not just the many movements of modernism but also of their stuttering and stammering manifestos . . .). There is indeed a cautious aspect to Bacon's practice of painting – a certain control that accompanies the wildness. The same might be said of Deleuze who, in his writings, practises an 'art of dosages'. It might be argued however that it is only through this caution, through this careful engagement with the matter of representation, that the line of flight from representation can be actually located. To quote Deleuze and Guattari themselves specifically on this methodological point:

> This is how it should be done: Lodge yourself on a stratum, experiment with the opportunities it offers, find an advantageous point on it, find potential movements of deterritorialisation, possible lines of flight, experience them, produce flow conjunctions here and there, try out continuums of intensity segment by segment, have a small plot of new land at all times. It is through a meticulous relation with the strata that one succeeds in freeing lines of flight. (Deleuze and Guattari 1988: 161)

III. Conclusion

In conclusion, we might say that the figural within Bacon parallels Deleuze's own philosophical project (and even more particularly the joint project with Guattari as laid out in *A Thousand Plateaus*) of thinking beyond the human. The human is to be understood here as a habitual mode of being (a *representational* mode). Both projects involve less a simple abandoning of the figure or of the human (that is, a complete disruption/abolition), but rather a kind of stretching or twisting of the latter. A rupturing that allows for the releasing of forces from within and the contact of forces that are without (both in fact being the same operation). Both Bacon and Deleuze are specifically mannerist in this sense (Deleuze 2003: 161). Both are interested in accessing the figural 'behind' the figure; the invisible 'behind' the visible.

We are now in a position to attempt an articulation of the connections between the notion of the diagram in painting and the intensive functioning of a minor literature: both involve a stuttering and stammering – of the figurative, of language – of representational modes. Both also involve the utilisation of these glitches as points

of indeterminacy that might finally allow something new, something different, to emerge. Indeed, although specific in many senses to Kafka's writings and to Bacon's paintings, both are, I think, incredibly productive concepts, not least in thinking through the effectivity of the expanded field of contemporary art practice as it exists today.

Triptychs, Eternity and the Spirituality of the Body

D. C. Ambrose Canterbury Christ Church University

Abstract

This paper develops a detailed reading of Deleuze's philosophical study of Bacon's triptychs in *Francis Bacon: The Logic of Sensation*. It examines his claims regarding their apparent non-narrative status, and explores the capacity of the triptychs to embody and express a *spiritual* sensation of the eternity of time.

Keywords: Gilles Deleuze, Francis Bacon, triptychs, eternity, spiritual realism, rhythm

One of Deleuze's ambitions in *Francis Bacon: The Logic of Sensation* is to outline an experimental conceptual analogue of Bacon's paintings that demonstrates a genuine fidelity to the specificity of his work. His book produces a philosophy of painting where Bacon is conceived as one of the great painters of immanence, a painter of the body without organs. His figural paintings are understood to repeatedly explore the vital intensities and sensations associated with the dynamisms of becoming, processes of individuation and the destratification of the organism, subject and individual. Deleuze suggests that a brutal form of realism is manifested by Bacon's art, but it is not a realism associated with the violence of appearance but a violence of sensation associated with a spiritual realism of the body. Bacon's paintings depict, he claims, a visceral topography of embodied sensation that is profoundly non-representational and spiritual.

One of the most complex and creative sections of the book is his philosophical analysis of the triptychs. In just a few dense pages he arguably provides one of the most powerful accounts yet written about triptychs in relation to the questions of what they are, how they function, and what operative principles govern their production. In this paper I wish to develop a reading of Deleuze's philosophical understanding of the triptychs that incorporates his arguments regarding their

non-narrative status within the claims he makes about their capacity to express a *spiritual* sensation of the eternity of time.[1] I will briefly demonstrate that the notion of eternity being elicited from Bacon's triptychs is largely derived from Spinoza's *Ethics*, namely, the eternity of substance and the eternal cycles of becoming. However, in order to fully grasp the significance of Deleuze's claims regarding the eternal time of triptychs it is necessary to re-examine his initial analysis of classic religious painting which forms much of the context for his argument. Despite the fact that religious art labours under the auspices of obvious narrative content, Deleuze will claim that it is still capable of conveying intense spiritual sensations associated with the celestial and abstract realm. Once we develop an understanding of how this was achieved in the past, the significance Bacon's liberation from the constraints of narrative has for his ability to embody a Spinozistic sense of eternity within the mechanism of triptychs can be explored.

In an interview from 1981 Deleuze talked explicitly about the role intuition played in developing his own understanding of the triptychs when writing: 'I was looking at the triptychs and had the feeling that there was a certain internal law, forcing me to jump from one reproduction to the other to compare them' (Deleuze 2006: 184). Some initial remarks on the triptychs are also contained in the preface to the English translation of the book,[2] where he clearly identifies the broad shape of his subsequent, more detailed reading. From the very beginning Deleuze aligns himself closely with Bacon's own remarks on triptychs, which were made in an interview from 1962 with David Sylvester (Sylvester 1987). Deleuze recognises an inherent quality in Bacon's triptychs, which he terms their 'internal law'. Triptychs are composed of three distinct sections, with the separation between panels serving to effectively negate any imposed narrative meaning across the different parts. However, for Deleuze it is precisely this separation which provides the means for linking the three panels in new and unique ways. He argues that there has to be some kind of relationship between the separated parts of each triptych, but that this relationship cannot be narrative or logical in any straightforward way. As he identifies in his subsequent analysis, there is a definite logic but it is of a profoundly irrational order – it is a 'logic of sensation'. The triptychs establish a common unifying fact for the diverse and separated figures within each of the three panels, but it is a unity radically removed from narrative meaning. Figures present in triptychs become reconceived as 'rhythmic characters' rather than agents or subjects operating within a narrative. Triptychs exhibit a 'brutal' unity where an array of complex forces and sensations,

rather than stories, are distributed across the separated panels. Each triptych operates like an infernal machine producing novel circulations and rhythmic interplays of these characters, forces and sensations. Somewhat enigmatically, Deleuze identifies a mysterious, unifying force, which is captured by the arrangement of the triptychs but which is also, simultaneously, the force operating to structure and unite the triptychs. This force acts to separate figures, both within and across the panels, and the panels themselves. Deleuze suggests that this unifying and separating force is the force of eternal time.

Before progressing with an analysis of Deleuze's complex reading of the triptychs, I think it is necessary to question the legitimacy of his emphasis on the non-narrative status of Bacon's triptychs. One might take the view that Bacon's insistence, when in conversation with Sylvester, on there being no explicit straightforward narrative is in fact mendacious, that it is part of his effort to control and conceal inconvenient biographical truths and sources in favour of constructing an elaborate mythological artistic persona. Whilst this is probably the case, it remains possible that his broader non-narrative ambitions indicate a more significant philosophical and artistic ambition that is indeed worth taking seriously. For Deleuze, Bacon's work instantiates a profoundly anti-narrative spiritual dynamic of matter. Nevertheless, by focusing on the non-narrative element I do not believe that Deleuze is altogether denying *residues* of narrative content that might be clearly present and form an important factor in fully understanding a specific composition. Bacon's deeply personal obsessions, experiences and inspirations form and shape the voluntaristic intentions that guide his hand at a primary pre-pictorial level and at the 'first level' of figuration on the canvas.[3] Deleuze is not necessarily denying the existence of this type of intentionality, rather he is bracketing it off, suspending explicit consideration of it, in order to concentrate upon the 'involuntaristic' aspect of Bacon's practice or the 'second order' of figuration. It is here, within what he calls 'the diagram', that Bacon's particular range of visual motifs are injected into a metamorphic, transformative and liberating realm (or experimental amphitheatre) of paint on the canvas.

A significant clue to understanding Deleuze's attitude towards specific narrative residue emerges from his treatment of religious painters whose figurative innovations are linked to Bacon's own. When discussing the structural and historical underpinnings of Bacon's practice, Deleuze discusses one of Bacon's operative propositions (a proposition derived from André Malraux) that is almost a truism within modern art, and would seemingly necessitate a move within painting towards a form

of total or absolute abstraction. This is the supposed conditioning of painting by 'religious possibilities' or imperatives which simply no longer apply, given that we arguably exist within an atheistic milieu. Deleuze contests whether this historical proposition is really adequate. Such contestation is only the first of a series of critical contestations of Bacon's ideas as outlined in the Sylvester interviews, many of which go some way towards countering the idea that Deleuze is guilty of the most crude and naïve intentional fallacy, and of slavishly adhering to Bacon's point of view. I want to argue that Deleuze's remarks on religious painting are critically incisive and do genuinely illuminate an important aspect of Bacon's work. More importantly, for my purposes, they provide useful insight into Deleuze's concentration on the non-narrative character of Bacon's triptychs. When writing of Bacon's proposition regarding the way painting's representational function was largely confined by religious or theological sentiment, Deleuze responds by arguing that 'the link between the pictorial element and religious sentiment . . . seems poorly defined by the hypothesis of a figurative function that was simply sanctified by faith' (Deleuze 2003: 9). To support his argument Deleuze analyses El Greco's *The Burial of Count Orgaz*. He notes the presence of a horizontal division separating the painting into two distinct sections – the terrestrial and the celestial. In the lower section of the painting there is figurative and narrative content (albeit unorthodox and already displaying a degree of figural distortion) as the Count's terrestrial dead body is laid to rest in the Earth. However, in the upper section where the count's living spirit is being received by Christ, there is an astonishing figural liberation – 'the Figures are lifted up and elongated, refined without measure, outside all constraint' (Deleuze 2003: 9). The figures in this section of the canvas are relieved of their representative (earthly and bodily) role, and are placed upon an entirely different, spiritual register (they are being put 'into relation with an order of celestial sensations' [Deleuze 2003: 9]). Deleuze uses this particular work to demonstrate how a Christian painting, ostensibly governed by the historical task of representing and communicating a sacred narrative, discovered startlingly aberrant painterly means for expressing non-representational and sensational affects. Here 'lines, colours and movements' are freed from the demands of representation and narration, and express celestial, infernal, immaterial and spiritual sensations. This is particularly true if one spends any time at all looking at the different ways Christ's body is depicted within the history of Christian painting as a means of expressing the broadest range of intense and extreme sensations, ranging from Cimabue to Grünewald.[4]

Deleuze's argument suggests that great religious narrative paintings, marked by representational imperatives, provide the conditions of possibility for an essential liberation of figures, i.e. the emergence of Figures[5] freed from figurative constraints and able to become the vehicles of sensation. He notes that 'Christianity contains a germ of tranquil atheism that will nurture painting; the painter can easily be indifferent to the religious subject he is asked to represent' (Deleuze 2003: 124). In Christian painting representational and narrative space is placed into a direct relation with not only accidents but also an aberrant non-representational space (an any-space-whatsoever), a spiritual space, the realm of the immaterial and the invisible. Intriguingly, Deleuze returns to the theme of Christian painting at the end of the book with a discussion of 'pictorial fact' (as opposed to representation, thematisation and narration) in Michelangelo's work. With Michelangelo 'pictorial fact' emerges in its purest state from Christian art where 'the forms may still be figurative, and there may still be narrative relations between the characters' – but these constitute the residues of the primary act of figural painting which are supplanted by the properly 'pictorial fact' (Deleuze 2003: 160). With Michelangelo Christian painting achieves an extraordinary level of pictorial facticity which 'no longer tells a story and no longer represents anything but its own movement, and which makes these apparently arbitrary elements coagulate in a single continuous flow' (Deleuze 2003: 160). His figures realise, within the realm of Christian art, a form of proto-Baconian pictorial fact where organic figuration provides a painterly vehicle for the 'revelation of the body beneath the organism' (i.e. the body without organs).[6] This body *beneath* the organic figure causes it to 'crack or swell' and imposes a 'spasm' on it forcing it into a relation with 'forces' – 'sometimes with an inner force that arouses them, sometimes with external forces that traverse them, sometimes with the eternal force of an unchanging time, sometimes with the variable forces of a flowing time' (Deleuze 2003: 160–1).[7]

If the extraordinary manifestation of bizarre figural metamorphoses in classical religious art (Cimabue, El Greco, Tintoretto) are functions of a religious sentiment being explicitly narrated, figured and represented in the paintings of this time, then one cannot legitimately abstract the religious sentiment from them, despite recognising within modernity that such 'truths' no longer hold. Religious sentiment and narration (for example, Christ's passion, the Creation, the Apocalyptic visions of Hell) animate and inform not only the efforts within painting to 'represent' them as events in space and time, but also the efforts to express them

as intensities, sensations, and extreme modes of affectivity (a divine realm *seen* and a divine realm *felt*). The affective register of religious painting remains locked into a causal relationship with the narrative content of the Christian religion. Such art might aim to represent a particular event in Christ's life (e.g. the crucifixion) as a type of religious or spiritual portrait, however to do this it is not enough merely to illustrate it as a discrete event in time. Rather, it is important to utilise the depiction of such events to communicate the affective force of the 'spiritual' depth associated with them. This affective quality, informed by religious sentiment, operates as a disruptive modulator to 'good' stable representational form and the earthly body becomes subject to deformation by invisible celestial forces. Bacon's own practice inherits much of this dynamic structure in so far as his work displays repeated motifs seemingly borrowed from (or almost certainly analogous to) traditional religious art – i.e. crucifixions, death and physical dissolution, bodies in the process of becoming immaterial (a process of 'becoming-indiscernible'), bodies confronting spirits, and bodies placed in relation to animals (a process of 'becoming-animal'). However, the religious sentiment and concrete theological concerns have been extracted and are no longer being represented or narrated. For Deleuze, Bacon's paintings operate like great religious paintings evacuated of their religious narrative and representation. Such content is simply of no relevance to Bacon – his work signifies an accelerated form of pictorial atheism, the very roots of which Deleuze identifies as being present in great Christian art itself. This explains the insistence upon the non-narrative quality of Bacon's triptychs – first and foremost Figures become the vehicles of sensation (rhythmic characters) and survive to serve as representative characters in a depicted narrative only in a residual and secondary manner, as in Michelangelo's work.

Deleuze's account is not incompatible with the idea that certain residues of narration remain as inevitable, irreducible or deliberate traces. Indeed, his account allows for the insistence that the primary narrative content (in so far as any can be adequately and accurately established) forms an important framework in the overall germination, negotiation and sculpting of forms in space and time on the canvas. What Deleuze does insist upon, and in this he is absolutely aligned with Bacon's own statements, is the *subsidiary* status of such content. Bacon's paintings involve an evacuation of religious content, theological narrative and spiritual drama, and the effort to replace it with an elaborate and audacious attempt to translate elements and events drawn from his own physical existence and filter them through his

particular nervous system onto the canvases as figured sensation. The historical specificity of Bacon's life becomes reconfigured through art into the grandeur of elemental eternity. This clearly fits with Deleuze's recognition of how the 'eternity of art' remains a constant reference for Bacon's practice: 'Like Rodin, he [Bacon] thinks that durability, essence, or eternity are the primary characteristics of the work of art' (Deleuze 2003: 123)

In my reading of Deleuze an understanding of Bacon emerges as a 'spiritual' painter (a mystical atheist). He enacts a similar dialogue between the 'actual' and the 'virtual' as El Greco had explored between the material and the spiritual, or the terrestrial and the celestial. Following the pictorial facticity of Michelangelo, Bacon's paintings pursue a hyperbolic form of pictorial hysteria where he is directly attempting, again and again, to release the presences beneath representation, beyond representation. His paintings repeatedly attempt to make such overwhelming and intense presence immediately visible. When discussing Bacon's renunciation of represented violent spectacles in favour of excavating the invisible forces beneath or beyond appearance as sensation, Deleuze comes close to identifying Bacon's 'spiritual' thematic, his spiritual conviction, as 'a kind of declaration of faith in life' (Deleuze 2003: 61). He considers statements from the interviews with Sylvester (particularly the remarks about cerebral pessimism and nervous optimism), and asks why choosing to paint 'the scream more than the horror', the violence of sensation, more than the violence of the spectacle, is an act of *vital faith*. In his clearest and most unambiguous passage Deleuze writes of Bacon's indomitable and visceral spirituality which has supplanted hoary old religious truisms and transcendental myths:

> But why is it an act of vital faith to choose 'the scream more than the horror', the violence of sensation more than the violence of the spectacle? The invisible forces, the powers of the future – are they not already upon us, and much more insurmountable than the worst spectacle and even the worst pain? Yes, in a certain sense – every piece of meat testifies to this. But in another sense, no. When, like a wrestler, the visible body confronts the powers of the invisible, it gives them no other visibility than its own. It is within this visibility that the body actively struggles, affirming the possibility of triumphing, which was beyond its reach as long as these powers remained invisible, hidden in a spectacle that sapped our strength and diverted us. It is as if combat had now become possible. The struggle with the shadow is the only real struggle. When the visual sensation confronts the invisible force that conditions it, it releases a force that is capable of vanquishing the invisible

> force, or even befriending it. Life screams at death, but death is no longer this all-too-visible thing that makes us faint; it is this invisible force that life detects, flushes out, and makes visible through the scream. Death is judged from the point of view, and not the reverse, as we like to believe. Bacon, no less than Beckett, is one of those artists who, in the name of a very intense life, can call for an even more intense life. He is not a painter who 'believes' in death. His is indeed a figurative *misérabilisme*, but one that serves an increasingly powerful Figure of life... In the very act of 'representing' horror, mutilation, prosthesis, fall, or failure, they have erected indomitable Figures, indomitable through both their insistence and their presence. They have given life a new and extremely direct power of laughter. (Deleuze 2003: 61–2)

This ethos is clearly linked to Bacon's efforts, following Michelangelo, to render life and time visible *through the material of the body*. For Bacon there is the chronomatic force of changing time which he depicts through the allotropic variation of bodies, and which involves a degree of figural deformation; and then there is the force of eternal time, the eternity of time, which is established through the uniting–separating that reigns in the triptychs, a pure light. One can begin to discern the reason for Deleuze's insistence upon the complete evacuation of represented narrative from Bacon's work (as he insists is evident within Michelangelo's work too), or at least its relegation to secondary traces or residues. What Bacon's work *ultimately* tries to figure is an expression of something fundamentally inexpressible, what it brings to visibility is something which is usually invisible, what it attempts to figure is the un-figurable. His work cannot be simply reduced to a matter of what is straightforwardly representational or narrative, since these imply the prior existence of things, events and ideas to be merely represented as such. It presupposes that all the things in Bacon's paintings exist prior to the work as something to be represented or narrated. For Deleuze, Bacon's ultimate theme lies outside all such coordinates, in much the same way as the divine celestial realm had for the classic Christian painters. There, a sensation (an affective element) of these realms could be allied to the familiar representational coordinates of the religious or theological dogmas of the time. With Bacon no such scripture exists apart from his own lived reality in time, his own nervous system, which he transmutes into figures resonating and hystericised by the invisible forces and intensities of the virtual in matter and the eternity of time.

Having established the 'spiritual' dynamics and thematics of Bacon's work, this paper will now proceed with an analysis of how that work specifically functions to encapsulate a certain sensation of time, namely of eternity. Deleuze initially establishes the key elements in their

structural mechanics. Underpinning their mechanics is the principle of *rhythm*. In the triptychs, he argues, rhythms become characters and objects. By initially focusing on their rhythmic characteristics, Deleuze identifies three basic rhythms being circulated across the separated panels of many triptychs.

1. A steady or attendant rhythm
2. Crescendo or simplification
3. A diminuendo or elimination

Referring to Bacon's triptychs, Deleuze attempts to uncover each of their rhythmic elements and demonstrate the full complexity of their actual interplay across the panels. The attendant rhythmic character does not necessarily always signify a straightforward visible observer or spectator/voyeur despite their frequent appearance in triptychs (for example, the presence of a voyeuristic figure in the right panel of *Triptych Inspired by T.S. Eliot's Poem 'Sweeney Agonistes', 1967*; a sinister cameraman in the right panel of *Triptych – Studies from the Human Body, 1970*, and the spectators in both the left and right panel of the *Crucifixion Triptych, 1965*). Rather the attendant refers to a constant function, a steady measure or cadence in relation to which spectators are able to discern or distinguish rhythmic variation. This function can have multiple objects which might include, but not be restricted to, the circular arena, photographic apparatus, photographs of figures, faces or objects which are flattened out onto two dimensional mirror-like surfaces, or it can be presented in several figures. Deleuze claims that it can be figured through flat hysterical smiles, the prone bodies of sleepers, and/or coupled or copulating bodies. These are defined as attendants because of their steady and almost constant horizontality. This horizontal quality defines a rhythm without increase or decrease, augmentation of diminution. However, the attendant function is anything but simple, and Deleuze goes some considerable way to further developing an account of its apparent complexity. Whilst the attendant function can initially be seen as something deliberately imposed upon certain visible characters in the paintings, it actually abandons them to become an autonomous rhythmic character which emerges into existence at different points throughout the three panels of a triptych. It does this by being assigned as that character by the active rhythmic characters in other parts of the painting. This dynamic, autonomous and self-generating character of the work is clearly something that resonates deeply with Bacon's own understanding of the process of auto-composition and auto-figuration. In an interview

with Sylvester from 1979, Bacon said: 'I don't really think my pictures out, you know; I think of the disposition of the forms and then I watch the forms form themselves' (Sylvester 1987: 136). This auto-formation of forms explains the type of emergence of the attendant rhythmic character in triptychs that Deleuze indicates. Attendant function might subsequently emerge from figures in full context which, if isolated from the entire composition, might actually appear to have either active or passive rhythms. For Deleuze this is why some of the prone sleeping characters in the triptychs have an odd trace of activity or passivity – so although explicitly situated across the horizontal they retain a certain heaviness or vivacity, relaxation or contraction, that comes from elsewhere. Equally, attendants can be seen as assuming other functions – as on the brink of turning to an active rhythm or passive rhythm – thus linking themselves to one or the other and ceasing to be an attendant.[8] This fluid autonomy creates not only great tension and instability but is also indicative of an extraordinary mobility within triptychs, what Deleuze terms their 'great circulation'. It is as if the triptychs function like musical machines possessing a range of different rhythmic permutations.

Having introduced the attendant rhythmic character, Deleuze proceeds with an explanation of the two vertical directions of active and passive rhythms. The simplest variation consists of descending or rising opposition (for example, *Triptych – Three Studies for a Crucifixion, 1962*) or perhaps a diastolic/systolic opposition. Occasionally the opposition at play is between being naked or clothed, or an augmentation/diminution of the flesh. Throughout different triptychs there exists an extraordinarily subtle and diverse process of additions and subtractions. The example which Deleuze talks about in most detail is Bacon's *Triptych – August, 1972* depicting George Dyer, which he claims is Bacon's most 'profoundly musical painting'. Across this triptych Bacon uses figural mutilation and prostheses in 'a game of added and subtracted values' (Deleuze 2003: 79). The triptych is like an assemblage of hysterical sleepings and wakings affecting diverse parts of the body. Here, the attendant couple in the centre panel are accompanied by organic elongations and a clear and well defined mauve oval. On the left panel the figure has a diminished torso, having had a significant portion of its body subtracted; while on the right the figure is in the process of being built up or added to. However, everything changes if one looks at the legs. In the left panel one leg is completed while the other is being subject to further addition and definition, while in the right panel, it is just the opposite – one leg has been amputated

and the other is apparently flowing away. Correlatively the defined mauve oval in the centre panel changes its status within the other two panels – on the left panel it is transformed into a pink liquid pool lying next to the chair, and then becomes a red liquid discharge flowing out from the figure's leg in the right panel.

For Deleuze this profoundly musical triptych is emblematic of the degree of rhythmic complexity and variation achieved by triptychs. The diverse oppositions across different panels are never logically equivalent in any normal sense and their different terms never quite coincide. What triptychs represent is a radical combinatorial freedom where multiple permutations can be produced. Each and every element can coexist in a unified way – share a simple matter-of-fact – yet the different oppositions set up can vary in diverse ways or even be reversed depending on the perspective or viewpoint that one adopts as a viewer. One cannot assign a single univocal role to the centre panel, since the constancy they seemingly imply can change depending on the case at hand. Hence, the horizontal of the constants govern extremely variable terms from the viewpoint of both their nature and their relation. The dynamic circulation is always composed of variable, opposable rhythms (where each operates as the retro-gradation of the other) offset against a common and constant value in the attendant rhythm.

At this point, in developing his understanding of the active rhythm, Deleuze insists upon the primacy of 'the fall' in Bacon's triptychs. However, it is not a sense of descent which should be identified with any straightforward spatial notion. The active is a fall in the sense of it being a descending passage of sensation, a passage identifying variation and difference of level within sensation. He claims that differences of intensity in sensation are often experienced and figured in Bacon's work as a fall. Flesh descends from bones, the body descends from arms and thighs. Sensation develops though this fall by falling from one level to another. The fall thus exists to affirm a variation in level. Whilst Deleuze reiterates Bacon's view that one shouldn't confuse the violence of sensation with the violent spectacle, he also indicates that the so-called fall of a sensation should not be confused with a fall through spatial extension. Rather the fall records variation and change and is simply what is most vital and alive in sensation. The fall is that which is experienced as the sensation of living. This does not of course preclude the possibility that it could coincide with a spatial descent. But equally it could coincide with a rise. It could also be expressed through a variety of different movements in the paintings – diastolic or systolic, dilation or dissipation, diminution or augmentation. In this sense, the fall as

the measure of variation in sensation is precisely what is meant by the *active* rhythm in the triptychs. Again, this active rhythm is fluid and variable, and the degree to which it is assigned to a particular figure or object within the painting rests upon which viewpoint or perspective one chooses to adopt. It thus exchanges its function with the *passive* rhythm.

Having analysed the different rhythmic characters associated with the triptychs, Deleuze establishes what he describes as 'the laws of the triptychs'.

1. There are three distinguishable, rhythmic figures.
2. There is the existence of an *attendant* rhythm which circulates fluidly through the panels as both visible attendant and rhythmic attendant.
3. There is a determination of an *active* and *passive* rhythm with all of the variations that depend on the character chosen to represent the active rhythm by the spectator.

Having set out these formal laws, Deleuze concludes by claiming that they broadly embody a profoundly irrational logic, a logic of sensation, that constitutes the art of painting in general. By stressing the power and vitality of this non-normative logic and non-voluntaristic means of composition, Deleuze instinctively aligns his own account again and again with Bacon. In 1979 Bacon told Sylvester:

> One of the things I've always tried to analyse is why it is that, if the formation of the image that you want is done irrationally, it seems to come on to the nervous system much more strongly than if you knew how you could do it. Why is it possible to make the reality of an appearance more violently in this way than by doing it rationally? Perhaps it's that, if the making is more instinctive, the image is more immediate. (Sylvester 1987: 121)

The full complexity of the formal elements now established, Deleuze crucially shifts his attention to the question of what forces correspond to the triptychs. What precisely is this complex machinic apparatus a means of capture for? And in what way does this force impact upon the structure of the triptychs? In the triptychs the question of the relation between the different Figures becomes extremely significant. Figures are violently projected onto the field and are often governed by the simplicity and clarity of uniform colour or naked light. In many cases, the figures look like trapeze artists whose milieu is nothing but light or colour. The particular methodology identified by Deleuze within triptychs is again something Bacon talks about with Sylvester. Particularly in relation to the question of precision and clarity: 'I've increasingly wanted to make

the images simpler and more complicated. And for this to work it can work more starkly if the background is very united and clear. I think that probably is why I have used a very clear background against which the image can articulate itself' (Sylvester 1987: 121).

Deleuze observes that if this unity and clarity of light or colour immediately incorporates and unifies the relationship between Figures and the Field, the result is that Figures also attain their maximum *separation* in light and colour. A force of separation or division sweeps over them, placing them within an almost spiritual milieu of eternity. This separation is therefore the unique principle of the triptychs (their pictorial fact) – maximum unity of light and colour for the maximum division of Figures. It is the force of this separating light and colour that engenders the distinct yet interrelated, rhythmic characters. The separation of bodies in universal light and colour becomes the common fact of the Figures – their overall rhythmic being – a disjunctive synthesis – a union that separates. A joining-together acts to separate the Figures and colours. Such, Deleuze claims, is the quality of light. Figures separate while falling into black light; colour fields separate while falling into white light. In the triptychs everything becomes aerial – the separation itself is in the air. Here time is no longer simply expressed in the apparent chromatism of bodies via the broken tones across flesh – it has become a monochromatic eternity. In the triptychs an immense space-time unites all things as if in a fourth temporal dimension. Deleuze writes of how triptychs, evacuated of any straightforward narrative linkage, unite things only by introducing between them

> the distances of a Sahara, the centuries of an aeon. Within the triptychs there resides the mysterious force of the eternity of time. The three canvases remain separated, figures within them remain separated, yet they are no longer isolated. They are united within the eternity of time. The frames or borders of each panel and the outlines of each figure no longer refer to the limited unity of each but represent and figure the distributive unity of all. (Deleuze 2003: 85)

In Bacon's triptychs a profound sensation of eternal time is being figured, producing brilliant aberrant figural spaces which resonate historically with the greatest achievements in religious art to figure the divine celestial realm. Bacon's rhythmic characters flow with an extraordinary dynamism across the vast spaces of the monochromatic eternity presented within the triptychs, each expressing a new spiritualism of matter, a new spiritualism of the body, as they perform their small embodied feats upon the grand amphitheatre of nowhere,

all playing their different roles in the musicality of becoming. Deleuze's most complex and controversial claim about Francis Bacon in *The Logic of Sensation* is thus to reconfigure him as a Spinozistic mystic, engaged in the profoundest of spiritual revaluations of existence through art. In the *Ethics* Spinoza defines eternity as that which stands outside all duration or time – 'Eternity can neither be defined by time nor have any relation to time' (Spinoza 1992: 214). True eternity stands outside of all temporal categories whatsoever. 'Before', 'after', 'now', 'later' and all such ascriptions are completely inapplicable to what is eternal. According to Spinoza God and Substance are both eternal, and even individuated and singular things as instances of substance are eternal. Despite the fact that we have no recollection of our own bodily emergence from eternity 'we feel and experience that we are eternal' (Spinoza 1992: 214). For individuated bodies to be seen as eternal they must be considered not in their temporally and spatially bound state, where they are in relation to other finite things in their normal durational existence, but from a more abstract perspective as atemporal essences – what Spinoza terms *sub specie aeternitatis*. Thus, according to Deleuze's reading of Bacon's triptychs, what Bacon ultimately manages to elaborate is a profound spiritual mechanics for displaying Figures *under the aspect of eternity*.

Notes

1. It is the 'revelation' of the 'spirit' immanent to the body which Deleuze suggests as the entire 'spiritual' thematic of Bacon's work. This point is clarified in the chapter on 'Hysteria' where Deleuze links the spiritualism of Wilhelm Worringer's Gothic Line to Artaud's Body-Without-Organs: 'It [the Gothic Line] attests to a high spirituality, since what leads it to seek the elementary forces beyond the organic is a spiritual will. But this spirituality is a spirituality of the body; the spirit is the body itself, the body without organs' (Deleuze 2003: 46–7).
2. This text first appeared in *Artforum* in January 1984, and is republished (with minor emendations) as a preface to the English translation of *The Logic of Sensation*.
3. See Deleuze's remarks in *The Logic of Sensation* (Deleuze 2003: 97–8) regarding first and second order figuration in Bacon's work.
4. This would seem to call for a rigorous study of Hegel's remarks on the history and development of Christian painting in the second volume of his *Aesthetics*. When writing of how certain painters had depicted Christ's suffering on the cross, he notes how 'some masters discovered an entirely peculiar tone of colour which is not found in the human face. They had to disclose the night of the spirit, and for this purpose fashioned a type of colour which corresponds in the most splendid way to this storm, to these black clouds of the spirit that at the same time are firmly controlled and kept in place by the brazen brow of the divine nature' (Hegel 1975: 824). Hegel writes at length about how painters had to betray the verisimilitude of representation in order to express 'spiritual' depths

and sensations. Deleuze's own remarks on what he calls the 'accident' and the depiction of Christ's body in the history of Christian painting recall Hegel's remarks. Deleuze notes how 'Christ is besieged, and even replaced by accidents' (Deleuze 2003: 124).

5. This differentiation is marked in Deleuze's text with the capitalised form of 'Figure'.
6. Note Deleuze's use of the specifically religious notion of 'revelation'.
7. In a footnote to this passage Deleuze cites Luciano Bellosi's work on Michelangelo, which 'has shown how Michelangelo destroyed the narrative religious fact in favour of a properly pictorial or sculptural fact' (Deleuze 2003: 196).
8. Of particular note here are the two spectral figures in the left panel of *Triptych – Three Studies for a Crucifixion, 1962*. These two figures hover and resonate with an ambiguous rhythmic character that is extremely disturbing and affective.

Introduction to Günther Anders' 'The Pathology of Freedom'

Katharine Wolfe State University of New York

> Never act in such a way that the maxim of your action contradicts that of the machine of which you are or will be part.
> (Günther Anders, *Die Antiquierheit des Menschen*; see van Dijk 2000: 82)

In the twenty-second series of *The Logic of Sense*, 'Porcelain and Volcano', Deleuze refers to a remarkable essay by Günther Stern – mistakenly referred to as 'Stein'. Stern is better known under the name of 'Anders' – 'different' in German. What relevance does Anders' essay have to this series? The series opens with a passage from F. Scott Fitzgerald's *The Crack Up*, and moves from the 'crack up' as an event no more internal than external (think of a crack in the shell of an egg, or, perhaps, one's own birth, or of how the blurriness of eyes tired from a day of reading is matched by dizziness in the world – Sartre) to the temporality of a particular kind of addiction: alcoholism. A crack or fissure extends along a life, as estranged as it is strangely one's own. Indeed, the crack up is not so unlike what Georg Simmel, in an essay Anders' references, calls an adventure:

> The most general form of adventure is its dropping out of the continuity of life. 'Wholeness of life', after all, refers to the fact that a consistent process runs through the individual components of life, however crassly and irreconcilably distinct they may be. What we call an adventure stands in contrast to that interlocking of life-links, to that feeling that those countercurrents, turnings, and knots still, after all, spin forth a continuous thread. An adventure is certainly a part of our existence, directly contiguous with other parts which precede and follow it; at the same time, however, in its deeper meaning, it occurs outside the usual continuity of this life. (Simmel 1971: 187–8)

Alcoholism extends the impersonal and transcendental event of the 'crack up' across a life by way of a caesura of time. Alcoholism, Deleuze writes, 'hardens' the present (Deleuze 1990: 158). In Fitzgerald, alcoholism's temporality is that of the past perfect – I have-acted, I have-broken, I have-touched – where the present auxiliary is the hardened present and the past participle the volatile, churning real it extends across and holds in its entirety: a volcano held in porcelain. Still, in alcoholism, the 'I have-drunk' collapses the near past of the last drink with the distant past of sobriety (Deleuze 1990: 159). Hardness becomes indifference and the present loses its hold on the past without ceasing to enclose it; lava turns to dust. Further, each drink is always already a drink I have-drunk, faded into the past at the same time that the past is washed out by the indistinction of its points. For the drink to break through the present is for the undifferentiated past to break upon the present and wash over it. The crack becomes a wound as the drunk meets her alcoholism and becomes an alcoholic, and no longer a sober companion to another self who has drunk. The self collapses into a single ego, no longer split into the actual event and a double that might 'counter-actualise' it.

Anders' essay is likewise concerned with the paradoxical and ever-incomplete synthesis of life with self and with what has happened within it. His 'Pathology of Freedom' diagnoses numerous ways of negotiating one's 'not being cut out for the world' that disavow rather than affirm this existential state. Deleuze's invocation of Stern's work comes within his sketch of a second form of alcoholism captured in Malcolm Lowry's novel *Under the Volcano*. In *Under the Volcano*, alcoholism is lived as a piercing and dire need. Time fissures under this need, but in a different modality. It hardens around a future under the form of a future perfect: immanently, 'I will have drunk.' It is to Günther Anders' remarkable essay that Deleuze turns to describe this future-oriented caesura in time. Readers of Deleuze's *The Logic of Sense* will also be interested in Anders' suspicion of identification with what happens to one as what one is worthy of or equal to, as well as Anders' account of paradox, repetition, memory, space, and the relation between life and self, to mention but a few of the themes touched on in this essay.

Günther Anders (1902–92), born Günther Stern, was the cousin of Walter Benjamin and the first husband of Hannah Arendt (between 1929 and 1937). Anders spent 1921 as a student of philosophy under Edmund Husserl and Martin Heidegger at the University of Freiburg, and completed his doctoral dissertation under Husserl's direction in 1923. In 1930, still working under his given name of Stern,

Anders gave a presentation of his developing 'negative anthropology' before the Kant society of Frankfurt and Hamburg entitled 'Die Weltfremdheit des Menschen' ('The Unworldliness of the Human Being'). This lecture, included in Anders' *Nachlass* housed in the Austrian Literary Archives of the National Library in Vienna, was the basis for the first French translation of Anders' work, by Emmanuel Levinas, published in *Recherches Philosophiques* IV (1934–35) under the title 'Une interpretation de l'a posteriori' ('An Interpretation of the *A Posteriori*'). Levinas translated the first 24 pages of the manuscript. The essay which appears here – first published in Volume VI of *Recherches Philosophiques* (1936–37), and translated by P.-A. Stéphanopoli under the title 'Pathologie de la Liberté' ('The Pathology of Freedom') – shares some content with passages from 'Die Weltfremdheit des Menschen' but does not have a clear predecessor in this text. The Österreichische Nationalbibliothek in Vienna, where Anders' work is archived, considers the original lost, and has undertaken a reverse translation into German based on the French and informed by some corresponding passages in 'Die Weltfremdheit des Menschen'. (My thanks go to Peter Hertz for reviewing the archive director's notes on this reverse translation.)

Stern took up the name Anders while working as an editor for the *Berliner Börsen-Courier* (1930–33). The rise of National Socialism and of Hitler in Germany changed the focus of Anders' work, directing him away from the academy with which he already felt only a tenuous bond. In 1931, alarmed at the inability of many intellectuals to fathom Hitler's potential to rise to power, he began writing a dystopian, anti-fascist novel entitled *Die Molussische Katakombe* ('The Molussian Catacomb'). In 1933, the advance publication of this novel together with the inclusion of his name among those in Bertolt Brecht's address book, confiscated by the Gestapo, made it unsafe for him to remain in Germany. He took refuge in Paris and then, in 1936, New York. After learning of the Holocaust from Arendt upon her arrival in New York in 1941, and later of the bombing of Hiroshima through President Truman's radio address to the nation, Anders' life work became centred around a critique of technology: what we can produce exceeds what we can imagine, the machine becomes the subject of history and its makers its raw material, and our primary affective relationships become relationships with machines and artefacts, which treat us in ways that, in the words of Paul van Dijk, render us 'both greater and smaller' than ourselves (van Dijk 2000: 78). Further, Jean-Paul Sartre once said that it was Anders who inspired his understanding of 'the human being condemned to freedom' (van Dijk 2000: 29).

The Pathology of Freedom: An Essay on Non-Identification

Günther (Stern) Anders

Translated by Katharine Wolfe

Abstract

In the twenty-second series of *The Logic of Sense*, Gilles Deleuze references a remarkable essay by Günther (Stern) Anders. Anders' essay, translated here as 'The Pathology of Freedom', addresses the sickness and health of our negotiation with the negative anthropological condition of 'not being cut out for the world'.

Keywords: Nihilism, historicism, philosophical anthropology, freedom, contingency

A Note on the Translation

It is Stéphanopoli's version of the essay, the one which Deleuze read and referenced, that is translated here. Incomplete and inaccurate citations in the French suggest that the piece Stéphanopoli worked with remained very rough. Here, citations have been corrected and completed for readability, with reference to English-language editions of sources where available, and hopefully without too great a harm done to the feel of the text. German passages and terms preserved in the French have been carried over into the English. All endnotes are my own. Anders's original footnotes have been incorporated into the body of the text, in parentheses {} and introduced with 'Note'. Although any shortcomings are my own, I wish to thank both Anne O'Byrne and Marcus Michelsen for their assistance in revising and improving early drafts of this translation.

An analysis of the situation of man in the world has revealed to us, in broad strokes, the following conclusions [see Stern 1934–35: 65]:[1]

In contrast to the animal that instinctively knows [*connaît*] the material world belonging to it and necessary for it – like the bird migration south, and the wasp her prey – man does not foresee his world. He has but one *formal a priori*. He is not cut out for any material world, cannot anticipate it in its determination, and instead must learn to know it [*connaître*] 'after the fact',[2] *a posteriori*; he needs *experience*. His relation with a factual determination of the world is relatively weak, and he is in the awaiting of the possible and the indeterminate [*le quelconque*].[3] Likewise, no world is in fact imposed on him (as, for example, on every animal a specific milieu), and instead he transforms the world and builds over it according to a thousand historical variants and in a way as a superstructure; sometimes as a 'second world', sometimes as another. For, to put it paradoxically, *artificiality is the nature of man and his essence is instability*. The practical constructions of man and his theoretical faculties of representation testify equally to his *abstraction*. He can and must disregard the fact that the world is such as it is for he is himself an 'abstract' being; not only part of the world (it is this aspect that materialism treats) but also 'excluded' from it, 'not of this world'. *Abstraction* – thus meaning freedom vis-à-vis the world, the fact of being cut out for generality and the indeterminate, the retreat from the world, and the practice and the transformation of this world – is the fundamental anthropological category, which shows the metaphysical condition of man as well as his λόγος, his productivity, his interiority, his free will, and his historicity.

Man proves his freedom vis-à-vis the world with all his acts, but in none so expressly as in the act of retreating within himself. For by this act he now takes in hand the destiny of his rupture with the world, he intensifies it until a gateway to the world is made, and he offsets the world by himself. What will follow proceeds from this self-experience and from the adventures of the 'unhappy consciousness', as Hegel calls it. This will be reduced in the first part to a description simply of the *nihilist* – of the man who, because sometimes free and sometimes not, sometimes of this world and sometimes 'not of this world', loses the possibility of self-identification. This failure of identification will be brought to light through an analysis of the nihilist *states of the soul*. In the second part, an antithesis will be opposed to the picture of the nihilist, that of the historical man. In conclusion, in place of a synthesis, the problematic will be put in question as such, and we will attempt to determine if the question, relative to philosophical anthropology, of knowing what man in general could be is justified according to this formula.

I. Thesis: Picture of the Nihilist

1. The shock of the contingent: 'That I am precisely myself'. The identification of the 'I' and its failure.

It is not necessary for man to accomplish a deliberate act of 'self-positing' or 'self-determination' (expressions that constantly recur in transcendental philosophy, particularly in Fichte) in order to secure the guarantee and the coronation of his freedom.[4] Man's retreat within himself reveals the ability to disregard the world and is already sufficient proof of freedom. But the expressions persist with all their excessive pretension. And they conceal the ensemble of difficulties and antinomies that lead to this free act of retreat into oneself: *i.e., the paradoxical fact that only if man discovers himself freely, by an act emanating freely from him, then he discovers himself precisely as non-free, and as non-self-determined*. The character of the 'non-positing by oneself' has a double aspect. On the one hand, the man who finds himself in the state of freedom discovers himself as 'existing there beforehand', as 'delivered' and 'condemned' to himself, as non-'self-constituted', as a real, irrevocable presupposition of himself, as a part of the world, as an *a priori* of oneself defying all subsequent freedom; as all that which the term '*Amor fati*' attempts to rise above. On the other hand, and this is in close correlation with the previous point, this irrevocable presupposition appears qualitatively as something absolutely indeterminate. Man experiences himself as *contingent* [Troeltsch 1951: 87–9], as indeterminate, as 'me precisely' (such as he has not chosen), as one who is precisely as he is (although he could be entirely different), as coming from an origin to which he does not answer and with which he nevertheless has to be identified; as precisely 'here' and as 'now'. This deepening paradox of freedom and contingency's reciprocal belonging, this paradox that is an imposture, freedom's fatal gift, is elucidated in the following way.

To be free, this means: to be strange [*étranger*],[5] to be bound to nothing specific, to be cut out for nothing specific, to be within the horizon of the indeterminate and in an attitude such that the indeterminate can *also* be encountered amongst other indeterminates. In the indeterminate, which I am able to find thanks to my freedom, it is also my own self that I encounter; by the same token, for as much as it is of the world it is strange to itself. Encountered as contingent, the self is, so to speak, the victim of its own liberty. The term 'contingent' must consequently designate these two characteristics: the

self's 'non-constitution of itself by itself' and its 'existence precisely such as it is' [*telle et ainsi*].[6] This holds for all that will follow. {Note: Hegel has presented a dialectic that we have totally neglected; it also relates to the insistence of the *I* on its own formalisation. The expression 'I' designates something precise, stripped of all contingent reality; but it does not only designate only the self. The expression is misleading, for everyone can say 'I', and the 'I' is everyone; thus, in existence there is moreover the general. If we put the Hegelian antinomy together with our own, it can be said that the self searches in vain to take place between its contingencies, the attributes that are accidental for it (but that always belong to it), and the form *I* in general [*Ichheit*] (that is not its alone). A painful position.}

2. Formulation of the shock of the contingent; falsification thereof.

'Why', demands Schopenhauer in his *Tagebüchern*, 'is the now precisely now?' [*sic*] [Schopenhauer 1969: 279].[7] This type of question is characteristic of the shock of the contingent. In so far as Schopenhauer does not intend to answer it, the question is nothing other than a formulation of this shock.

Nonetheless, the translation of the shock ('that I am precisely myself') into an interrogative proposition – and it is only under this form that the problem of contingency appears in the history of philosophy – seems to us to emanate already from a theoretical point of view, and appears falsified. The real shock can be formulated only in a subordinate anacoluthon; it is much too fundamental and much too absurd for one to be able to answer it. For alone susceptible to answers are the questions that arise as formulations of the lacunae that a context, unquestionable in itself, may comprise. And in the case of the shock of the contingent this context and its non-problematic state are precisely shaken. Even more illegitimate than to translate the shock into an interrogative statement would be to transform it into a judgement – to return it, for example, to the proposition 'I am not myself', the like of which may be encountered in numerous formulas imitating Hegel. All judgement, even dialectical judgement, observes [*constate*].[8] But the observation [*constatation*] at the base of the shock is precisely this one: that however unhappily, I am nevertheless myself. Translation: 'I am myself.'

Without fail, judgement also knows the distinction between Subject and Predicate as such a rupture. But although it is possible to transform or to exchange the predicate, this cut presupposes the identity of the subject with itself. It is precisely this identity that will be shaken in

the subordinate. For what shocks in the shock of the contingent is not even primarily the fact 'that I am thus or not', but precisely the fact that 'myself, I am myself'. The intention to formulate this state of affairs by a dialectical formula runs up against the fact that in dialectical logic 'is' almost always means 'becomes', the transformation of one determination into another by the intermediary of a phase of transition ambiguous in itself. There can be no question of it in our case. What is there only a more or less ambiguous phase of transition becomes the theme of our research.

3. An extension of the matter of contingency.

The contingency that the *I* discovers within itself must not decrease when it enters into relation with the world. Although by this route the *I* loses itself in the world most of the time, to such an extent that the internal division of this free and contingent *I* is only a neutralised element of consciousness, it can happen, conversely, that the relation with the world and the encounter with anything whatsoever can hold the 'being-precisely-me' [Gerade-ichsein] in suspense, further still than before and in a continuous way. Astonishment [*étonnement*][9] before the contingent – formulated initially in the proposition 'that I am precisely myself' – now discovers in every thing and in every place an occasion to show itself and a source of nourishment, and is expressed thus: 'that I am neither this one here nor that one there, but precisely myself'. {Note: The many forms of Pantheism that convey fraternisation and identification with the All are revealed on more in-depth examination as no more than opportunist dissimulations and a deficiency of self-identification. See the following implications of contingency and of Pantheism in Hölderin's *Empedocles*.} This possibility of being everything thus signifies neither the unity nor the affinity of the *I* with man and with world, but, conversely, its perfect strangeness: *it can be all, because it is as strange and as contingent to itself as to any other part of the world*. Each contingent thing that I am not increases once more the weight of the fact of being that which I am precisely. The *I* and the world complement each other, reciprocally rising up in their fortuitousness. If the *I*, itself contingent, seizes the occasion of the world to confirm its own contingency once more, that of the world will be likewise made more radical. From now on the accident of self-identity and the uselessness of 'self-identification' will be attributed to each fragment of the world as such, that is, outside of human contingency: the one who is astonished now pronounces 'that this, which is here, is precisely

here and nothing else'. Likewise in this new phase, nothing contingent, an accident, will be observed [*constatera*] starting from something non-contingent, a substrate; astonishment will still remain in a way within the field of the validity of the principle of contradiction, with the pathology of this astonishment characterised precisely by constantly breaking such frameworks. And what this boils down to is that any *Hoc* and *Illud* is really itself. {Note: Thus formulated, this paralysis of things and this nihilist stage of freedom appears completely contrived. Nevertheless, we are acquainted [*connâit*] with it in pictorial art. The majority of still-life paintings make it their theme. For in these paintings, man not only depicts the thing that has lost its relations with others and has become strange to them – as if it were not 'his' thing, the thing that is no longer either man's neighbour or handled by him, and which, isolated in a space without atmosphere, is simply there (Chardin) – but also the thing as contingent, as if it were blameworthy in its own mode of existence, and which, fixed now in the painting, can no longer escape from the shame of its contingent existence (for example, the chairs and the shoes in the first Van Gogh). It is not by accident that this ridicule and strangeness can be represented by art. For isolation is not only characteristic of strangeness, but is also an important condition of the beautiful (cf., for example, the function of the frame). Painting that fixes the aspect of a man or a thing in a picture seems as it were to repeat the act by which each thing is already condemned to itself.}

Hölderlin, in his first outlines for Empedocles, described contingency and what is unbearable in it in the following way: Empedocles would be unsatisfied, inconstant, suffering simply because (these relations) would be *particular* relations [*sic*].[10] Each determined relation is thus for him the loss of all the others; each being-itself the loss of all the beings whose form it could take.

But Empedocles' contingency is not the most radical. Empedocles searches and finds deliverance anew from his 'Being-precisely-this', the pantheistic salvation: total being, to which he entrusts himself while leaping in the crater and in which his personal being, the being that he is precisely, is sublimated, remains for him the non-contingent, the last absolute. It is certainly understandable that one reserves such a salvation, a non-contingent residue. But this goes against the nihilist's classical principles. For the radical nihilist, in his fury at contingency, renounces not only the unique, the particular, and the indeterminate, not only the being that he is personally, but the being of the existent itself, which falls now under the curse of indeterminate contingency, as if it were any existence whatsoever. 'That there exists a world in general',

'that there exists a "there is something"', 'that I am quite simply', 'that there is something in general which I am'; such are the formulas that the nihilist employs.

In truth, the henceforth unlimited astonishment that is expressed in these expressions and the shaking of being's simple existence have their deepest foundation in this state of things: that man at bottom is not cut out for any mode of existence whatsoever, but for himself, in so far as he is also of the world. He reaches a pathological extreme in so far as he remains within theory alone, in so far as he does not realise his freedom in practice, in the constitution of *his* world. {Note: This goes for all the forms of freedom that are here discussed. They all belong to the domain of reason, described by Kant, that deceives itself and that, in place of being understandable as praxis, in place of transforming itself into practical reason, remains theoretical, and so moving and tragic that it is possible for the antinomies and pathological forms of freedom born henceforth to arise. These antinomies, insoluble within the framework of theoretical reason, will be resolved by practical reason; further still, they will no longer be posed.}

4. Digression on the general validity of the statements concerning philosophical anthropology.

These first formulations of the non-identification of man with himself are exaggerations. But they are, if it will be allowed, *philosophical exaggerations*. The principle indicated is at the root of the facts, but, taken as such, it appears more radical than reality and seems pathological. If man dwelled perpetually on the impossibility of self-identification, there would remain for him no other solution [*issue*],[11] to put it bluntly, than suicide – the only one the Stoics perceived; no other means to abolish what one is in the state of non-freedom, to cancel contingency. However, what we are calling 'philosophical exaggeration' is not falsification; if consciousness of contingency is, admittedly, almost always less precise and more illusory than the formulas claimed to express it, these formulas are nevertheless born of the nihilist life itself, and must be once again, as it were, there transposed. They are thus not only statements concerning the life that unfolds in the paradoxical, but documents emanating from this life itself. The exaggeration stems from what these statements in principle only express in situations of exception, of which, moreover, certain formulations complete and specify actual [*effectifs*] states, and lead them only then to their actual truth [*effective*]. What is 'exaggerated', that is to say, pushed to an

extreme of acuity and to a bare truth, is in the first place the situation of contingency itself, and in the second place only the statement of which it is the object. The formulations are thus not only expressions of this existence but they 'inform' it, and in such a way that they *become* real.

Although we take them to be rare, situations of non-identification are probably not. They are only rarely expressed and rarely communicated because their formulas are not the starting point of anything and because they come from a socially non-existent point of view (for they are neither questions nor answers; they reveal only astonishment). Even if it will be admitted that such situations are extremely rare, this will say nothing against their philosophical value or against their utility in philosophical anthropology. It should be noted, moreover, that philosophy preserves a certain antipathy towards treating the infrequent philosophically, be it due to the identification of the general and the essential, fatal in many respects to Western philosophy, or because the verifiable in general is accepted as criteria of the scientific. It is very characteristic of this state of things that Jaspers dealt with his theory of 'limit situations', which are certainly rare, in a 'psychology of conceptions of the world'. It was not quite obvious in his eyes – still wholly confused by a naturalist conception of science – that he was philosophising in treating despair, death, ecstasy, etc.... It is necessary to uphold, on the contrary, that the rarest human situations and the least familiar human types can play a part in an interpretation which would aim at the general on the condition of considering and interpreting the very fact of their rarity. To return to our case, we can say that an extremely precise state of shock of the contingent is rare, because, in the first place, the duplicity of the *I* is not experienced in practice – the man who discovers himself as already existing can really *make* something of himself – and because, in the second place, the mortal shock is resolved into attitudes that already constitute a *modus vivendi*, attitudes that conceal their character of contingency. The study that is attempted here can thus only have for its theme a subject whose life continues, and thus of such compromise attitudes. {Note: What goes for these exceptional human situations goes for all the phenomena and human types that must be explored in philosophical anthropology, this being something that must not remain perfectly empty out of consideration for the concept of validity in general. Such an account, which seems directed against scientific 'rigor', and just as easily justifies precisely those who depend on the fixation of general traits, that, more often than not, must admit of statements that are valid in general, does not sufficiently question

the philosophical significance of the term 'generality', and does not hesitate to take 'generality' for a purely logical category that could be indifferently applied to all classes of objects. These statements are false. For the general plays different roles in different places (different in the domain of the animal, for example, than in that of man); it becomes in each case significant only in relation to individuation and specification, in such a way that, consequently, these general statements have for each class of objects a different essentiality and dignity. *Man is general in a very specific* [*spécial*] *way*; he is not realised according to a single form foreseen in principle and valid in general, but, as daily life and history indicate, according to many different types. Man is in plural 'men' in an entirely different way than the animal is in plural 'animals'. In the latter case the plural signifies the generality of the specific [*spécial*]; in the former, the set of the multiple specifications of the general. Such a plural represents much more than just empirical variants of an *a priori* 'humanity' in itself. It is the fact of the variation, and not the constancy of the variable, that defines the specifically human in philosophical anthropology. Therein, it is true, something of the general is likewise still expressed. To what extent is a general determination valid?

The fact of not being fixed on any *a priori* material world, of not being settled on any world, of not having any foreseen determination, thus of being *indeterminate*, defines man essentially (as we have shown elsewhere, *Recherches philosophiques*, IV).

It is thus only to the point of specific indetermination that the general determinability of man is possible. What comes from this indetermination, what man makes of it, can no longer be determined from the point of view of the general if one does not want to affirm and deny indetermination simultaneously. The case of the nihilist who perpetuates the instability and the indetermination of his role, who does not decide in favour of any determination and who ceaselessly confuses the indicative 'can' with the conditional 'could', and who does not want anything other than to find himself in his most formal *I*, is a special case. We will not hesitate in what follows to introduce a different type of man, equally 'held up' to philosophical anthropology.

We are aware of thus making ourselves advocates of the concept of the type, employed and rejected in an equally vague way. The criticism addressed to this concept, namely, that it does not have the univocal structure of γένος, should be handed over to another court. The famous 'accusation of the good Lord' with which the biologist set an end to the ideas of his colleague, the mathematician, is also applicable here.

If the essential is not essential through its generality, the question of knowing if a thing will be general or specific [*spécial*] could be rejected as non-philosophic. Undoubtedly, the philosophical enterprise, accustomed to an average generality, becomes unstable in renouncing its claim to the general; it does not know to just what specific [*spécial*] and to just what concrete it can and must advance. When it deepens into the specific [*spécial*], an external limit of its competence is not prescribed in advance. Instead, as in historical research, the thing that one discovers and the documents by which one discovers it are mutually conditioned and corrected; it is the result of this working together, which decides the degree of specification [*spécialisation*] and this decides the result.[12]}

5. Shame as the reality of the consciousness of the contingent, and as the classical form of its concealment.

{Note added by Stéphanopoli: The states of the soul to be treated further, and encompassed in the German term '*Scham*', are exhausted neither by what we call 'shame' nor 'modesty' considered independently of one another. Sometimes expressed as shame and sometimes as modesty, it is a matter of shame of being such as one is, of one's own origin, and thus of something pre-existing which serves as the foundation of these expressions, and of others as well, to which a nuanced analysis might appeal. (It is thus a matter of an affective state inherent to an existence, not to an action. Shame of the act is remorse. Shame of being diversifies up to the point of regret and sometimes reaches shame of the Act. The 'shame' in question goes thus from regret of the Act from which I arose, and which is not mine, to modesty in unveiling my self, which is not as I would have liked.)}

Thus we return to contingency.

The state of shock of the contingent, as an attitude within life, and stripped to the fullest extent possible of all shocking character, is called *shame*. Shame is not originally shame of having done this or that, even though this form of shame already signifies that I do not identify myself with something that emanates from me, my action, and that nevertheless I must, that is, by constraint, identify with it. The fact of being capable of this special moral shame itself already requires that I am at the same time identical and non-identical with myself as a formal condition; *that I can not get out of my skin, even though I can conceive of it as such*, which I meet in the freedom of the experience of myself – but as non-free. Shame is not born of this incongruity; this incongruity is itself already shame. In shame the self wants to free itself, in so far as it feels definitely

and irrevocably delivered to itself, but where it escapes it remains in a deadlock; it remains at the mercy of the irrevocable, and thus of itself.

Nevertheless, man makes in this a discovery: precisely whilst he experiences himself as not-self-made, he has a presentment for the first time that he comes from something that is not him, he has a presentment for the first time of the *past*; not, however, of what we are accustomed to calling the 'past', not our own, familiar, and historical past, but precisely the completely strange, irrevocable, and transcendent past; that of the *origin*. Man has a presentment of the world from which he comes but to which he no longer belongs as himself. *Thus shame is above all shame of the origin*. We defer to the first biblical examples of shame: to the coincidence of shame and the fall, and to the example of the sons of Noah who, 'the face turned away from shame' [*sic*],[13] covered the nudity of their father. {Note: In the case of historical man, *Scheu* (*veneratio respectus*), that is, timid respect, is the piety that replaces shame. It is the circumspect approach of one's own past and of the one that precedes it, which is undoubtedly further off, but which is no longer beyond.}

Although the origin arises as what one *is not* as free, and what one could not elect by a free choice, the category of the origin is a characteristic category of human existence. The animal has not accomplished the definitive leap from the origin [*Sprung aus dem Ursprung*] into freedom. It remains constantly bound to the reality from which it comes and confused with it in such a way that the origin can no more be considered as anterior reality than the animal can be considered *qua individuum*.

For this being only, separated from the reality from which he comes, and for whom it *is not* there for him alone, this reality is something unique; it is the *origin* and as such it is to some extent endowed with a transcendence that presents itself under the aspect of anteriority [*Transzendenz nach rückwarts*]. In man alone, the liaison with that from which one comes can be maintained.

What starts as shame [*Schande*] ends as honour:[14] the one who is ashamed undoubtedly returns to himself. The power to not remain in the grips of the world, with its heritage of being-precisely-oneself and being-also-of-the-world, and the power to refer yet again to oneself, testifies already to the double condition of man: although he is something other than himself, he is nevertheless himself. The one who is in the state of shame undoubtedly flees, but only towards himself. He would like through shame to retreat underground, but he only retreats into himself up to the point where he forgets, proud of the power to escape (in himself), the motive that he had for fleeing (from not being himself).

Then the one who is in the state of shame prides himself on his power of concealment. He sublimates and falsifies his genuine motive, which has been presented as the scandal of shame in the failure of identification. *He now makes the misery of shame a virtue*. In the concealing, he rehabilitates the concealed under the aspect of the secret, or alternatively holds it in reserve as his most intimate and deliberate self, and as what belongs to the self expressly and belongs only to the self. In concealing, he appropriates what he must conceal, what is of the world, what is 'common' in the world, and what there is in 'common' with the world, in such a way that it now becomes 'private' and one's 'own'. The weariness of being-precisely-myself and the original motives of concealment are now not only stifled and disowned but are also the occasion of a strengthening of oneself and of a positive pride. The man who has so transformed shame is no longer engaged in this world, it is no longer offered to him. And he denies afterwards, while abstaining from the world through callousness and through purity, the fact of having come into the world through contingency and the imposture of 'worldliness'.[15]

Precisely because of this moral *happy ending*, shame is the most typical symptom. In it, since life continues, the antinomy is transformed into a *modus vivendi*. Among many other equally instructive symptoms the most important is *self-disgust* because it presupposes the habituation of the *I* to itself, which is fulfilled in the course of life, and thus its *identification* 'despite itself'. Self-disgust is the occasional protest against this automatic habituation of the *I* 'precisely to itself'. At the moment when disgust occurs, life takes on, as it were, the function of an external milieu in which the *I* is misled in perpetuity. In self-disgust, one is not strange to oneself and astonished, as in the shock of the contingent but, on the contrary, is *too* familiar to oneself. Yet this self-habituation proves next to nothing against contingency. 'Why', asks the I in disgust, 'is this self precisely so familiar to me?' 'Why does all this concern me?' And it returns so-called 'normal' self-identity to the simple habituation of the parts of the self to each other.

The thousand forms of hypocrisy, of disguise, and of comedy positively exemplify the negative proof of shame and disgust: the instability of man in relation to himself, his vagueness. The self succeeds only provisionally at abandoning its precise existence as such and thus at taking the form of another and making itself, as it were, the occasion and the matter of multiple personifications. The provisional is itself conclusive: among all the species, man is the one who has the least character.

6. The future perfect; the spirit of escape [fugue];[16] *man in the subjunctive.*

In shame, man discovers himself as delivered to himself, as a being that was already there before the act of self-experience. The imperfect 'I was there' is in a sense already a disavowal of my self as free [*mon moi en tant que je libre*]; even more so is the past perfect, as far back as one can go. For the past perfect announces that 'what had been there, that was not me'.

This dubious freedom to proceed as far as the past perfect, and to act as if one reached what is underneath the self, has a parallel in man's possibility of reaching the future perfect. This possibility is equally the sign of his freedom and his non-freedom; it also leads to the failure of self-identification.

For a start, the simple future is the most common symptom of human freedom. It is no more than a cliché that the future is the dimension of indeterminacy, the dimension within which I can act. It is no surprise that philosophies that spring from the Kantian theory of freedom, from Hegel's to Heidegger's, are philosophies of time.

But in so far as man does not realise this freedom in the practical – in so far as he uses the dimension of the future to override his contingent 'being-precisely-now' [gerade-jetzt-Sein], as he reserves all the energy required by the demands of the hour, as he spends it in order to realise this dimension as such and is committed more and more, hands tied, to the positive direction of time, *ad infinitum – he compromises his freedom*: for the more he proceeds, abandoning his ties, in the direction of the future that this freedom makes him glimpse, the more he is led astray in the domain of the indeterminate [*l'indéterminé*]. The future thus prolonged is qualitatively transformed, it is dialectically reversed, and all of a sudden it is no longer the future that is man's own. This is mislaid in something that is no longer available to him. To this 'time' not even the specific direction of time, its forward sense, applies; it is reduced to something that will no longer be of the future, to an αιών irrelevant to the self. Man can surely still think and indicate the existence of this αιών, but in a sterile way, without comprehending or realising it; it is too far beyond the horizon of life that is close and one's own.

The 'I will be' is henceforth changed into a 'what will be, I will not be'. The positive expression of this formula is the future perfect: 'I will have been'.[17]

That man can declare 'I will have been' and that he can outlive himself in thought constitutes an astonishing act of freedom and of

self-abstraction. In anticipating memory, he returns to himself as if he were not imprisoned in the framework of his present life, as if he were able to live his life in advance, to be transported beyond it, and to preserve its memory; a memory to which he is nevertheless referred in the time of his present life, for which the future is henceforth neutral. But what he discovers in these acts of free self-transposition is once again something negative; he sees himself pushed back into the deepest past and already sees his death – still future – as past, like his birth. Everything is already seen as past, and, as in *Ecclesiastes*, everything that does not accidentally express its nihilism in the future perfect is understood as 'vanity'. To those that will be, no memory will be granted by those that will come after them, because they will have simply been. And already the future becomes past.

This freedom to exceed oneself (of which the future anterior is both the triumph and the failure) has its analogue in the *spatial freedom* of man. This is particularly important because space, more than anything else, represents a possibility of evading the being that I am precisely. This degenerates into spatial panic and the spirit of escape.

One can envisage space, as does Max Scheler, as a milieu, seeing it as the product of the freedom characteristic of motility [*liberté motrice*], as the independence of the here and the there, and as their permutability.[18] This freedom can now go astray, veering off into areas of complete irrelevance to me. If it sets its course according to its own impulse, a moment comes where it exceeds the limits of its own domain. Countless 'also-theres' [auch-dort] arise without any differentiation: they are there simultaneously and claim to be there singularly, without this simultaneity being fulfilled in such a way that man could be there-and-there at the same time. *Together these points remain in the subjunctive*. Since 'I could have been here, but also there and there', every here is changed into a 'precisely-here', whose contingency makes it unbearable. No 'here' is preferred to another.[19] The original sense of spatial freedom, in so far as it consists of a power [*pouvoir*] to pass from a certain here to a certain there, is neutralised by the fact that free movement [*liberté motrice*] is on the wrong track. This neutralisation can present itself as inertia or as the spirit of escape. The one to whom space presents itself under the aspect of the pathological and who falls into the contingency of the 'here' no longer attempts any movement because this would be entirely useless; or, indeed, the anxiety of 'never being able to be here precisely and of having, nevertheless, to be precisely here' will become identified with the panic of the nihilist in the paradox of freedom: to want never to be precisely-me and to be nevertheless perpetually

restrained to the precisely-me. Space appears now as the ensemble of the possibilities of fleeing the precisely-there and the Being-precisely-me. But all emigration ends nevertheless in a new here and pushes the wanderer from one contingency to another, and from one subjunctive to another.

Pulled from one side to the other by the excessive possibilities of the world and of things that he knows simultaneously, and of which he knows that to experience them is to lose them, the one who is sick with the sense of Space, snatched from the place that he has just given up, does not arrive at nothing; he remains, in the strong sense of the term, always himself, because he is the only constant within the change. Nevertheless, he never actually [*effectivement*] returns to himself. At bottom, he searches for nothing. If he seeks something, it is not the determinate, but precisely the end of determinations. He wants to impose the *equivalence* of this 'there' and another 'there' in order to *occupy* it with his own present, because, in another way, this would remain an imaginary dimension. This equivalence, however, can never be verified through an omnipresent existence. It oscillates thusly, seeking over every thing the indetermination of everywhere; but it is deceived at every step of the way by the determination of the precisely-here.

Nothing can stop this pursuit; it comes to its end only there where the sick fall blind and dizzy. The points reached, then lost again, and all those not even reached, are reduced to each other and interchanged. Omnipresence finally seems achieved because during the short duration of vertigo, they enkindle the indetermination sought. But this is only an appearance for this indetermination costs too much. It cannot be preserved because we have ourselves been struck by indetermination at the moment where it sprung up in space, and as guarantee of our own existence, there is nothing more than the uneasiness of vertigo. Just like the fundamental panic of being-precisely-me, this wandering is condemned to a perpetual repetition: the pursuit begins again. This attempt to make Being-precisely-there disappear is once again overcome:

That is, the specific precisely-Here loses its significance, and the pursuit of other heres and other theres becomes unmotivated and superfluous, as soon as the space of all heres – *the space of the world* itself – gathers in one and the same *precisely-Here*. One is now the *prisoner* of the *precisely-Here*, in spite of the incalculable number of fragments of the world still unrealised; in whatever direction one turns, one always remains precisely-here – that is, *in this world* – and the attempt to steal away from this world, to escape from it through any other place, is thus revealed as impossible, for there is no wall

surrounding the Here that could lend itself to any effraction. One is prisoner of the precisely-Here not despite but because it is precisely without limits. The terror is transformed into torpor.

It is necessary to explain once more why being-precisely-here is identified with being-precisely-me, and why, in the impulse that determines the escape from the self, in the flight before the being-precisely-me, the *Here* is abandoned in the place where it is oneself. For the man who possesses κινησις κατα τοποη, the system of spatial positions appears as the very principle of immobility and contingency: no point can transform into another, none concerns the other, each is nothing but itself. Space is thus the *Principium individuationis*. This reciprocal indifference will undoubtedly only be manifest for the being who can pass from one point to another, for the being that can go out of the element to which it is accustomed. This the animal cannot achieve because, despite its κινησις, it remains in its specific vital space, its own milieu, and never transports itself in what is strange as such. This only man can do. He *can abandon 'his' place, and he hopes that by losing it he can forget the principle of individuation and his own belongings. And in losing what belongs to him – the 'his' – he hopes to lose himself.*

7. Thirst for power and search for glory.

The one ill from the sickness of space wants the contingency of where he is precisely to be neutralised. He wants to be *everywhere at the same time*; he wants to *seize* totality in one fell swoop. But the desire to possess is only one specification of a deeper thirst for power: the desire to render the world congruent with oneself, more exactly, to force the world to become the *I*. It can at most become *mine* instead of becoming *I*; for the thirst for power, this is the first scandal and the first compromise.

Although a symptom of the shock of the contingent, the thirst for power also strives to neutralise the fact of contingency. In the fact that man is given to himself in advance, that he can only discover himself without being able to invent himself, and that the world and the Other are always ahead of him, the weakness of man is ceaselessly demonstrated to him and reproached. He cannot bear that there is still something outside of him that is not him. He cannot bear to be in the world superfluously, like 'a fifth wheel on a car', for it works just as well without him, or that once condemned to being, he must content himself with being only one being among others. The total absence of limitation to the thirst for power which wants to hold everything under its thumb, even beyond all necessity, is only the expression of the

absolute disappointment that the *I* feels when it realises that once in existence it is confined to *share it with* other beings and that the totality of existence is not its alone. A word from Nietzsche, 'If there was a God, how could I endure not to be God' [*sic*], constitutes the definitive formulation of this painful state.[20] In the desire for power, man seeks to make up for the advance that the world has on him; since already he *is not* all, he must *have* all. He gets his revenge on the world by spreading his contingent self over the world, by incorporating it within himself and by representing it. For the one who is powerful is no longer only *himself*, such as he was in his miserable condition, but this one and that one, himself and the other, an ensemble. He is simultaneously here and there and there again. For he is, in domination, in representation, and in glory, to employ an expression from theology, *omnipresent*.

So he wants to be now and always. That is, he attempts to be immortalised in time, just as he worked to be glorified in space; he attempts to subsequently refute the contingency of the now to which he is abandoned. And he endeavours to set up his authentic being in the form of a permanent monument, in relation to the Memory and in the Renown of which his actual and incomplete form stands merely as the phenomenon to the Idea. His being is still only the unfaithful and temporal copy of this glorious monument. Here is the paradox: the more its glory increases, the less he 'himself' seems to have to do with his own monument. It has usurped his name and will reap the glory in his place even long after his death. Crushed and devastated, he is now envious of his own great name.

It is not by chance that we have entitled the preceding the 'pathology of freedom'. It would undoubtedly be vain to think that the goal of this designation is to draw a portrait of the complete man. The descriptions that correspond to it are, as we said, philosophical exaggerations. But the pictures that we have presented, considered in themselves, are not absurd. They represent the radical dangers that man can be subject to, and they are better known to each of us than one usually thinks; dangers which are here pushed to their ultimate, catastrophic aspect, compromising life itself. The forms of shame, disgust, desire for glory, depict compromises that are all too familiar to us. And if, in these ordinary phenomena, we are not in the habit of discerning the shock of the contingent, it is because of their 'ambivalence'. They all present themselves, as it were, in positive disguises; they constitute the *refuges* where one escapes from the threat of the contingent, and, compared to suicide, they are already *modi vivendi*. Shame, disgust and desire for glory take place, in the final analysis, in the course of contingent

life; since practical life is a self-affirmation, they are already constant compromises with life accused of contingency; they are protests and insults. They are the protests and injuries that splinter on the back of the insulted enemy, and which are nevertheless made for him to carry, less in order to constantly devastate him by their sarcasms than in order to remain purely and simply with him in order to live. Antinomies are rarely stronger than the love of life. The Nihilists also want to live.

II. Antithesis: Picture of The Historical Man

8. Life continues. The shock of the contingent repeats itself unwillingly.

> 'One thing alone can cure us from being ourselves.'
> 'Yes, but at bottom, it is less important to be cured than to be able to live.' [*sic*]
> (Conrad, *Lord Jim*[21])

The man who gets lost ceaselessly and futilely in the deadlock of his own contingency, and who finds his way in his 'being-precisely-me', as if he did not have life behind him, and precisely as if each time he had just been born, *pursues his life*. This is to say that paradox does not spring forth suddenly, from an imaginary point of departure situated 'before' life. It is rather in the middle of life itself, of life as it goes on in defiance of paradox and from under it, in so far as man does not make paradox a pretext for putting an end to himself. To whatever extent he compromises and impedes the course of life with his fanatical formalism and constant interruption, alleging that it is not itself, and that it cannot continue because it can take place in *iteration* and indeed must take place in iteration if it wants to remain effective [*efficace*], he concedes the possibility of life that perseveres in spite of him and he yields to it. The possibility of its repetition thus drives paradox *ad absurdum*; this is itself paradox and contradicts its own destructive claim. Consequently, the condition of paradox is iteration. The latter is itself paradox anew; for paradox should never be repeated within this life which it claims can never have a positive outcome. In fact, that paradox repeats does not mean that it repeats itself on its own initiative. Its movement is neutral from a temporal point of view; neither would it want nor would it be able to generate the temporal mode of repetition on its own. Repetition is rather the paradoxical temporal mode of life itself as it is realised in duration *against all* paradox: life hastens against the resistance of paradox opposed to its course, and at each point of this current of life

paradox is experienced in so far as it plays the part of a barricade. It is thus not paradox that repeats but life that repeats the experience of paradox at every moment. From the point of view of the resistance which paradox represents, it is always the same life that collides with it in order to afterwards continue its course from under it. Repetition only takes place for the life that goes on; it thus develops as the permanence of its arrest. It always represents the *specific* negation of life carried out in time.

As iteration of the identical, 'movement opposed to memory' [*sic*], repetition is thus the principle of the neutralisation of historical time within a life that can continue its course even outside historicity [cf. Kierkegaard 1941: 33].[22] *That is, the nihilist paradox of the experience of freedom characterises non-historical existence, or more exactly, existence against history; this* [*existence*] *consequently heightens its own difficulty and attempts with so much obstinacy to attack the walls of the antinomy that contains it as it is deprived of time, which alone, in so far as it could be historical, would pass for an answer to paradox*. The man henceforth deeply engaged in the idea of the antinomy is actually non-historical. What so falls due to him in division – and this necessarily since he now pursues his life once and for all – that is, what he is and what he was, is not in a strict sense a life; it is at bottom only an event arriving accidentally, an event that in relation to the constancy of paradox remains something simply possible and does not lend itself to recollection [cf. Simmel 1971: 190].[23] The shock of the contingent thus destroys the strict possibility of experience itself, of appropriating life lived *de facto*. Everything happens as if it took place 'for nothing'; even the fact that it has been lived is constantly repudiated by paradox. Since he has been exposed to the accidental change of his fortuitous experiences, if man tried to return to himself, he could no longer capture his life *in concreto*. For there is no life, strictly speaking. Not because of but despite the paradoxical nature of man's situation at large, at the moment when paradox takes place at 'the interior of life', it becomes increasingly stringent, and all the more stringent as it neutralises life and makes it unfit for memory. Yet it becomes in the end the one and only real. That is to say, it is not only paradox that is disavowed by the life that continues, but life is in its turn disavowed by paradox; because it is unfit for recollection, and because it has yielded its vital force and its reality to paradox, it passes by as if it were not there.

It is only an apparent contradiction that both life and paradox are at once the conquered and the conqueror. If life merely goes on, it is defeated; paradox loses out in turn because it is constrained

precisely to repetition, constrained to ceaselessly seek to overcome. This ambiguity and oscillation between victor and vanquished, never finding the equilibrium of indifference, preserves precisely the paradox 'of life'; and the duration of what is lived in life in spite of paradox determines paradox's pride. For the larger the field in which man continues, the more paradox proves that it was right. Thereby man in despair finally 'grabs hold' of himself and of the contingent fact of his being-precisely-me, and remains suspended in this situation, without having succeeded at discovering himself or at unifying himself through a positive experience.

Here already, with man in the grips of paradox, the historical path takes shape as the power [*puissance*] opposing paradox. This fact expresses that historical life is itself placed outside of paradox, but also that the man opposed to history, instead of simply meeting paradox, brings it to light as his characteristic property. It maintains, fixes and tyrannises man, acquiring for him a sort of retro-active truth. That is to say, paradox is only valid for the man who experiences it in its acuity, and who does not easily come to the end of it. Thus paradox expresses the troublesome character of the very one who questions; it is not the sign of a 'question in itself' which would exist apart from the one who questions or which would apply to man in general. The special situation corresponding to the paradox of identification is thus determined. But if we now cross over to a new type, the historical man, we can no longer conceive of man as a fugitive before the shock of the contingent; it is necessary to consider him as a type *sui generis* which is already beyond the state of contingency, and of which the principle traits, such as memory and the ability to experience, do not represent ulterior acts carried out with an eye to salvation, but original *modi vivendi*. {Note: admittedly, these are still *modi vivendi* that do not yet reveal man in full possession of himself and in the free exercise of his freedom. We do not quite reach to the highest degree of self-concretisation. It is a matter of a return to the concrete, the steps of which have already been marked out in the history of the philosophy of freedom: between the Kantian philosophy of the *I* and the Marxian theory of practice and of action, there is a Hegelian philosophy of history.}

9. The 'I remember, therefore I am myself' as the minimum of identification.

The nihilist who expresses himself in the proposition 'that I am precisely myself', when he wants to escape from himself, turns in circles or only

encounters a contingent stranger who bears his name. It is difficult to positively determine the mode of identification that such an I awaits and claims. The proposition that he states expresses at bottom his indignation in the face of the fact that the various parts of his self do not coincide through the miracle of a pre-established harmony. He does not realise that identity can be stabilised subsequently by memory. This can be brought to light by a kind of *Cartesian argumentation*.

From the point of view of memory, the antinomy and the difficulties of identification that have just been described are inconceivable. *Because what I discover as myself in memory does not only contain the 'strange', but also precisely me, the subject itself that is affirmed. The man of yesterday whom I remember already contains the two I's in an indissoluble union*. For the same reason, the very man who is astonished today by his contingency has the possibility of remembering his being astonished yesterday.

Thereby, a minimum of identification is achieved, so to speak, in a Cartesian manner: the *I* now no longer insists on its being-here and its being-now; he has suddenly discovered in himself a determination (i.e. yesterday's shock of the contingent) with which he can identify in good conscience today. He no longer discovers only the contingent man that he avoided, but the one who avoided contingency. But here is what is strange: both are already unified in memory. It is not only the act of recollection that confuses them. The object of memory is already an identity in memory. This will be further interrogated. Speaking first of the forms of identification: they are thus not immediately expressed by the formula 'I am myself', but by the alternatives, '*that which I was, I am*', and '*I remember, therefore I am myself*'.

This argument appears somewhat complicated. Two different types of identification intersect; it is firstly today's *I* that is identified with yesterday's; then in yesterday's *I*, the formal and contingent I merge. The second point is the most important: in yesterday's I, all that happened to it, all that it experienced, is confused. For yesterday's I is not exactly an 'I' but a *fragment of life* – at least in the eyes of today's memory.

10. Identification and the possessive.

For what does one remember? {Note: This question has not been posed despite the imposing number of monographs devoted to the psychology of memory; for this psychology is nearly always interested in the quantum and duration of memory. Philosophy, for its part, barely caught sight of the question. It accepted as a matter of course

that memory agreed in its object with perception, that only their acts and their temporal value differed. An analysis along the lines of ours, which is even phenomenological in the sense of the school, has been curiously neglected in thorough analyses of phenomenological time.} This seemingly crude question is decisive for philosophical anthropology. Unlike perception which has its object in front of it, a fragment of the world, memory is memory of a *situation* in which the perceiving and the perceived, the *I* and the world, are already confused to such an extent that neither the *I* without the world nor the world without the *I* can be abstracted as such from this single given.

I see, for example, a misfortune approaching me; it is still strange to me. It fills me with anguish: this anguish is nothing other than the stupefaction of the *I* before a radically strange object. But in memory, the misfortune is already *mine*. Not only do I remember its approach and my subjective reaction, but I remember the whole of the situation, which consists of the two preceding aspects, and thus presents itself as a fragment of life. It is henceforth impossible in the face of this fragment of life to fall back into astonishment that 'as myself I must be myself', because, in the case of painful experiences, it is in truth no longer the *I* that recalls memory and which arranges that which is recollected, but memory itself that forewarns the I and arranges it. In identical cases it is not the I that defines the self but lived experience; and now the I is no longer as indeterminate as before. From this point of view the shock of the contingent, in spite of the terror that accompanies it, even seems to be a kind of supplementary element: this terror of being precisely myself, disappearing because of a really unpleasant memory, can be postponed to a subsequent epoch and appears futile.

In memory, the contingent events that one has lived, those which occurred by accident, are thus already confused with the *I*. Identity was established before the terror of identification could rush to the surface. From this, one can draw very important conclusions for the notion of experience. Memory thus abolishes what we have recognised of the indeterminate and of the contingent in experience. In memory man discovers himself as a situation and not as an I; what he experienced, he now *is*; and if he disregarded the experience of his 'being such as it is' [*tel et ainsi*] [sosein], as well as everything he experienced and the modalities of his entire history, nothing of him would remain, not even his former *I*.

But this is not enough. For it is not only particular situations and fragmentary experiences which appear in memory, but life as a totality; life in the sense of bibliographical life. But it does not present itself as

a 'Gestalt', or as the unity of a thing; it is there as a 'medium': one is at home in one's own life, this life is *my* life, in spite of and through the multiplicity of beings and of things experienced. It is furthermore the field of all particular experiences wherein each is identified as '*mine*'; and I can run through it at any time. Through his history, which becomes one with him and envelops him, man escapes from the strangeness of the world and from the contingency of his 'being-precisely-me'. The identical proposition 'I am myself', analytical at its origin, and contradicted by the shock of the contingent, is transformed into this more meaningful proposition 'I am my life' or 'the self is life', and thus into a proposition of identification that is '*synthetic*' in the true sense of the term. It is completely characteristic that the 'am' and the 'is' of the two preceding statements are interchangeable. Life is not only the first person (I) nor only the third person (something strange and contingent), but is a possessive: it is *mine*, it is MY LIFE.

In truth, this '*my*' does not indicate the presupposition of the I as the proprietor to which life belongs. This would be to argue against history from a nihilist point of view of existence all over again. *The possessive pronoun does not ordinarily designate only the fact of possession but also the fact of 'being possessed'; neutrally, it designates the general fact of belonging. 'My' life thus equally signifies the fact that I belong to my life, as I, and that my life belongs to me, as mine.* {Note: It is only now that we reach the concept of authentically human experience. It represents here 'the having of the experience of life', a concept that indicates a knowledge of what there was to experience in life, a complete mode of man: this concept of experience could not have arisen earlier. Originally, that is, for the man against history, experience is not. For originally, that is, for the man against history, experience is not in itself 'experience of life', but rather announces a need for experiences. Experience thus becomes experience of life only from the point of life recollected and already lived as such. Curiously, in this situation, man finds not only himself, and even less the contingent things that he has experienced, but he extends his experiences to a characteristic generality that one can neither define nor refute theoretically. In any case, this generality signifies that the type of experience in question is not simply the subsequent result of experiences previously undergone, but that it is qualitatively more than the sum of these specific experiences. In so far as man can continue his life and grow old, and consequently no longer remains, like the nihilist, in the perpetual repetition of the now, this type of experience can become the specific character of the stage he reaches.}

The most diverse traits of historical man testify to the self-identity memory reveals under its formal aspect. He no longer knows the surprise of 'being such as it is' [*tel et ainsi*], of 'being-precisely-me'; he no longer knows the concrete faces of the shock of the contingent. The historical man would consider absurd the ideas of the nihilist on an indeterminate *transcendent* origin, and on his being placed here below thanks to a strange design. He is beyond the polarity of the present and the transcendent past that the nihilist, on the contrary, felt with such acuity. For he has his *own* past, a past in which he is not only united with his experiences, but with other beings and other persons. Even the time of his ancestors is not, in truth, strange to him; it is only distant. He can 'approach it with piety'. And if piety, like shame, is at the same time respect and fear, it does not compromise identification, as shame did. Piety consists instead of recognising the distance that the act of identification must cross when it realises the identification of a being with his ancestors.

11. What today is called 'I' as of tomorrow will be 'life'; of what the I's formality consists.

If the *'I'* nevertheless restores these a posteriori and contingent original experiences to its life through memory, this subsequent identification does not present any incorporation nor any organisation of the matter of life by an already *formal I*. For this *I* is nothing other than the vanguard of the plenitude of material life itself. If the *I* is formal, it is thanks to life; it is because life laid out and forced to consider all the possibilities, to experience the new, and to show presence of mind, formalises itself in an *I*, and ends at the point of an acute and lucid present, in such a way that it puts an end to its material richness at the point where it culminates. Whereas the nihilist I believes he chances to be precisely this man or that, and claims: 'Me, I am called man', it is, on the contrary, man who gives himself the 'name' of I, and who actually formalises himself as an I. *Man is not the rear-guard of the fact named 'I', but the I is the vanguard of the state of affairs named 'man'*. What is I today, so as to introduce life to experience and the world, constitutes my life as of tomorrow, joined together with all that was present; and a part of what is my life today was the 'I' yesterday.

The alternative between the *I* and contingent determination that ceaselessly shocked the nihilist is, so to speak, a mistake the I makes about its own role: it emphasised its conditioned formality and its presence as positivity and freedom; it opposed this to life 'which is only

material', and which sinks into the past. *This mistake about the self*, which brings the *I* to *actually* [*effectivement*] break with life in the case of counter-historical existence, does not take place in the case of historical man.

The conception of the *I* 'as a constitutive element' of life (at once in a logical and a temporal way) must yet not be understood as if there were no difference between the form of life and of the I. Certainly, they form but one in memory; yet memory itself is not an indifference, but a perpetual identification. A certain duality is incontestable; a certain hiatus remains, ventured through life between itself and the I. It is only when it gets ahead in the freedom of its possibilities and when it wants to be 'in the know' ['*au courant*'] that it takes precisely the form of the I. This hiatus admittedly always disappears in memory, and identity is restored anew.

We said above that memory 'informs'. We understand by this not only that the *I* remembers, and not only that the I 'keeps its life in the know', but that *life* draws its I close to it and into itself. This type of memory is even more frequent than the first. It has commonly been neglected in theories of memory, for this relapse of self within life does not present itself as an act, and psychology, like philosophy, is quite elementary when it comes to the vocabulary of the I's passivity. The conditions of normal memory are such, in any case, that the I yields to life's gravitational force ['Schwerkraft'], where it is then charged with melancholia ['Schwermut'] and drawn to life's interior: it thus disappears as the I and as the terminal present.[24] For memory, life is no longer *its* own life, for life and I are now confused, there is no longer between them this distinction, this separation, which alone allows the use of the possessive pronoun. The life that is thus at home in memory no longer has need of particular representations, of the realisation of former situations, of the precise repetition of past experiences. It can fully suffice with the states of the soul of another time, of which images and realisations constitute a secondary process. {Note: Cf. the classical example of Proust (*A la recherche du temps perdu,* I, ch. I) [*sic*].}

12. Identity in certain stable situations.

The presentation of the problem of identity and of identification would be incomplete without mention of the situation in which the panic of identity does not break forth, and where no problem of identification arises.

If in order to be at home, man is forced to superimpose on the natural world an artificial world, arrested and constructed by him – that is, the social and economic world with its customs and its laws – he shows undoubtedly that he is not cut out for the natural world. But this second world, ever varied according to historical conditions, can nevertheless succeed and stabilise, to such an extent that man is in his element there and the problems and pathological attitudes of identity fade into the background, just as identification does through history. In these stable social states, *it is the world itself that takes care of identifying* the self before auto-identification is necessary.

The social world already realises a minimum of identification in the *name*. Once man is baptised – and no one can baptise himself – the name persists as a constant in life; and it is a constant so natural that the one who is named, without worrying about the debate between nominalism and realism, not only claims *to be called* John or James, but *to be* James or John. Conversely, in the case where the name is changed (as is, for example, the name of the woman who becomes a wife), a real [*effectif*] change takes place.

James is thus named James today and tomorrow, and is regarded as James yesterday. Identification thus seems assured. But as we have said, it is only so when the milieu remains relatively identical and identifiable. *For the identity of the self* is *a function of the identity of the world which is its correlate*.

In this world, we thus exceed the minimum guaranteed by the name and the I now plays a determined role. This role can be so stable and so natural that it obstructs the *role of man* (the judge, the professor, the general, etc.), and disregards it. Thus it is conceived of as independent of him, as his simple substrate, and as simple 'role overload'; thus as an *empty* 'I'. This ensures that man sees neither difference nor antinomy between himself and his function, and that he cannot restrict his authentic existence to an abstract self. In these stable situations, the phenomenon of the role of 'what' and 'that which' one is, is no less a 'primary phenomenon' than the phenomenon I. That the role represents the accident and the I the substrate – a distinction which undoubtedly applies to the situation that we experience in this day and age, in which the social world ceaselessly transforms itself and in which man continually changes position, as well as to a great number of social and historical situations – is not *a priori* and is not demonstrated by the philosophy of the I. *In stable or stationary epochs, it is entirely possible that it is not the self that 'has' a role, but conversely the role that 'has' a self; at the very least it is possible that the tension and*

the non-identity that were treated in the portrait of the nihilist *are not realised*.

In the situation outlined here, the relation between man and the world differs essentially from the one that has been described up to now. Under the form of the role, belonging to the social world, 'social worldliness' [soziale weltlichkeit], is already in place. That here the world is not something 'exterior', something that is added on to me, shows the uselessness of terror in the face of the contingent as well as the necessity of its interiorisation by memory and its subsequent assimilation. One might think that in the stable situation where man is identified through the world, he is discharged of and exempted from all collaboration with identification. This is not the case. Rather, even in stable situations, man must comply with and answer to the claim to identity that the world places in him. This correspondence consists, in truth, of other acts than the simple acts of recollection that are the means of historical identification. It consists of moral acts, of acts of 'responsibility' above all. Today I must answer before the world for what I did yesterday. This identity is clearly no longer of a historical nature, but is of a juridical and moral nature. It is historical only when, on the one hand, the place and the role of man, and on the other hand, the claim and the authority of the world in him, become so vague that man is forced to call himself by his name so that he can answer to it through identity and so be put back 'in himself'. Just as it is from the heart that one obeys for his part the call of duty according to Kant, the call of identification now springs up from the heart of the historical man. When he answers his own call and when called by his name, when he pulls himself together and is put back in himself, he resembles, from the point of view of the stable situation, the Münchhausen knight who pulls himself out of a marsh by his own hair.

From the point of view of this identity guaranteeing the social, the two types that we have described up till now, the nihilist who does not succeed in identifying with himself, and the historical man who takes charge of his own identification, no longer appear so far from one another as it seemed before. For both *need* identification. And the forced staging of the rescue of the historical man together with the unconcealed catastrophe of the nihilist testify to their identical position: strangeness in relation to the world.

Despite this similitude, the portrait of the nihilist appears philosophically much more important to us than that of the man placed in historical existence. If the essence of man actually [*effectivement*] consists of his non-fixity, and thus of his propensity for a thousand

incarnations, it is the nihilist who makes of this instability *as such* his definitive destiny, and who is determined by indetermination; he does not profit from specifying in this or that manner. The nihilist, indetermination incarnate, paints *an exaggerated portrait of man* through his manner of flaunting his faults without the least concealment.

Next to this the portrait of historical man appears of dubious ease. Man as historical presents himself as a being who is worthy of [*à la hauteur de*][25] what happens to him, of his contingency, and as a man who has the courage to risk *amor fati* because he follows *fatum* closely and always calls it 'myself', who thus, to employ a famous Hegelian formula in a non-orthodox sense, makes all that is in him, and in him by contingence, 'reasonable' after the fact [*après coup*]. Certainly, he takes pride in saying in the face of all that happens to him 'this is mine'. But he cannot dispose of what has become 'mine': this identification is thus suspect.

13. Calling into question the problem of philosophical anthropology.

Identification is not so simple. Undoubtedly, it is necessary, when one is not identified and situated by the world itself, to be identified through oneself. Nevertheless, it is not enough to be situated in oneself. Without the world, identification is impossible. *The one who acts* (disregarding the socially identified self) is alone set apart from the difficulties of the terror of contingency; for he does not insist on his ceaselessly assimilated past but on his task, which relates him to the world. Although the world did not assign him a determinate place anymore than the nihilist and the historical man, he actually [*effectivement*] achieves identity.

In the eyes of the one who wills, what is willed is thus, compared to everything which is only encountered and to his empirical existence, something non-contingent. This non-contingent, in contrast to experiences, goes without being assimilated; it is the will that must assimilate the world. {Note: It is not by chance that many *want* to will simply in order to escape from contingency, and that the fact of having a task is a solution for them.}

It is true that there is a good possibility that the world appears contingent to the one who seeks to transform it. But it is beyond all contingency that it is *him* who has the will to transform it. If one now wants to attempt to mimic the proposition we have stated 'that I am precisely me' in the formula 'that I will precisely this', the latter would be revealed as a pure construction: it is absolutely inconceivable starting

from the will. And if one accepted this formula in the situation of will, it would neutralise it. The man who seeks something precise can be against the world, and although the world did not assign him a determinate place, can thus achieve an actual [*effective*] identification. This would be expressed by a formula that is neither that of the nihilist – 'I am myself' – nor that of the historical man – 'I am that which was' – but which is stated as follows: 'what I willed, I will'. In the concept of the task, the constant is already there; it is thus not necessary that it be maintained as such, in the form of a memory or of any experience. For the task disappears only once the result is achieved. {Note: It is entirely characteristic to observe that from the permanence of the will results, without the least secret intent, *a* life, and that few biographies, and even few autobiographies, offer a unity as clear as those of the life of great men of State or revolutionaries, whose will aimed at everything but identity. This unity is thus a kind of 'bonus', unlike that of autobiographical existence.}

Through this recourse to action, it is true that philosophical anthropology reaches the limits of its legitimacy, its capacities and its competence. From the point of view of what man *does*, the question 'what is he and who is he authentically?' seems wrongly posed. *For acting is not being.*

It was Hegel who made the act disappear in considering it as already both developing and to come (and it becomes an actual [*effectif*] being subsequently and as past). In making it already engulfed by being itself, he transformed it in any event into a kind of 'being', and a kind of being not specifically human, for it is not by chance that it is called 'organic'. This attempt, the consequences of which are unlimited, now obscures the phenomenon of action. It was Kant, however, who treated the question as such and without any mask, although Hegel more explicitly than Kant gave an expression to the problem of self-identification. (He characterises history as the fact of coming to itself for the spirit that is not identical with itself). Self-identification through 'Aufklärung' and through the critique is an action for Kant: there is no question for him of observing [*constater*] what reason *is* (and for him it is equivalent to man), but of constituting it through the critical operation.

Hegel asks himself on the contrary what it *is* in order to answer dialectically that it is not *Being*; thus, although proceeding by negation, the answer that he gives remains within the framework of the theoretical. It recoups the qualitative leap from the theoretical to the practical from the term 'genesis', and replaces it in the theoretical domain itself. Historical materialism gets credit for having formulated anew

the specific sense of Kantian idealism, that is, the transformation of theoretical reason into practical reason.

The aims of Kant are ours also. And we presume that they carry a much greater significance than we had supposed at the start. Philosophical anthropology and its problem of the definition of man must consider itself opposite human action as a productive misunderstanding, and put an end to itself.

The question of knowing what man is authentically [Eigentlich] *is consequentially wrongly posed. For the theoretical definition is only a shadow that decision rejects in the theoretical realm* [*sic*].[26] '[W]hat I am in an authentic sense', 'what I discover in me', is always already decided, whether by myself or by another. What is opposed to the definition of man is thus not the irrational but the fact of human action; the action whereby man is constantly defined in fact, and whereby he determines what he is on each occasion. In this perpetual definition of himself that man presents in acting, is it useless to appeal to the principle of order, to demand a moment's pause to pose questions of 'authentic' definition, and to establish what man is in an 'authentic' sense. There is nothing more suspect than this 'authenticity' [Eigentlichkeit]. It is no accident that the German term *feststellen* [*constater*] signifies both to state something [konstatieren] and to fix something. And it is not by chance that the problem of definition (for example 'what is authentic to a German?' and also 'what is man authentically?') presents itself in conditions of reaction; in particular, in the state of incertitude and of crisis where one is no longer anything precise. The one who poses the problem of definition is now the inactive one, the one who compromises the real transformation and poses this problem retroactively, so to speak. 'Who am I authentically?', he asks, in place of being actually [*effectivement*] defined and of making someone of himself. While he poses the question and as he poses it, to put it hyperbolically, he is nothing at all; he is thus whatever he or another has made of him with the aid of an outdated practical definition. This is what he can consequently discover and define as his authentic existence. The question of knowing who I am is not of the sort that it is sufficient to pose, but of the sort that it is necessary to answer.

We finish with this consideration. The problematic of philosophical anthropology, which explored in the first part the pathological specifications of human freedom, appears from this point on as itself a contaminated form that denatures its problems. It makes of autonomy a definition of oneself; and while it teaches man to run after his 'authenticity' [Eigentlichkeit], it abandons him to those who have

an interest in putting him in his place, and makes him his lose his freedom.

Notes

1. The reference is to Emmanuel Levinas' translation of the first part of (Stern) Anders' presentation before the Kant society of Frankfurt and Hamburg in 1930, entitled 'Die Weltfremdheit des Menschen' (Stern 1934–35). 'Pathologie de la Liberté' shares some content with the later half of the same lecture.
2. Stéphanopoli's quotation marks suggest that Anders' term is 'Nachträglichkeit', from Freud. The term is conventionally translated as 'après-coup' in the French, and is translated as 'deferred action' in James Strachey's English translations of Freud. Jean Laplanche suggests 'afterwardness' as a preferable English rendition. See the editor's introduction to Laplanche (1999).
3. Alternative translations of '*le quelconque*' include 'the whatsoever', 'being whatsoever', 'anything whatever', and 'the indefinite'. I have chosen to translate '*le quelconque*' as 'the indeterminate' throughout, due to its adequacy in every context. Where noted, 'the indeterminate' translates '*indéterminé*' rather than '*quelconque*'.
4. Stéphanopoli's translation uses the terms '*auto-position*' and '*auto-production*'. In the English scholarship, 'self-positing' carries the significance of Fichte's 'setzen', which means to position or place as well as to posit.
5. I have translated '*étranger*' as 'strange' throughout the text.
6. Alternatively, '*telle et ainsi*' might be translated 'in such a way'. Literally, it translates as 'such and so', 'such and thus', or 'such and in this way'. Stéphanopoli may be translating the German '*sosein*' – 'suchness' or 'essence' – with this locution.
7. 'Why is this now, his [the questioner's] now, precisely now and *was* not long ago? Since he asks such strange questions, he regards his existence and his time as independent of one another, and the former as projected into the later. He really assumes two nows, one belonging to the object and the other to the subject, and marvels at the happy accident of their coincidence' (Schopenhauer 1969: 279).
8. See Anders' remarks below on the dual meaning of the term *feststellen* in German which Stéphanopoli's *constater* is likely translating here.
9. I have translated 'étonnement' as 'astonishment' throughout the text.
10. The early sketch for Empedocles, called 'The Frankfurt Plan', opens with this passage: 'Empedocles, by temperament and through his philosophy long since destined to despise his culture, to scorn all neatly circumscribed affairs, every interest directed to sundry objects; an enemy to the death of all one-sided existence, and therefore also in actually beautiful relations unsatisfied, restive, suffering, simply because they are *special* relations, ones that fill him utterly only when they are felt in magnificent accord with all living things, simply because he cannot live in them and love them intimately, with omnipresent heart, like a god, and freely and expansively, like a god; simply because as soon as his heart and his thought embrace anything at hand he finds himself bound to the law of succession . . . ' (Hölderlin 2008: 29).
11. '*Issue*' also translates as 'exit'.
12. The French term '*spécial*' carries the Latin *speciālis*'s sense of being of a given species.
13. See Genesis 9: 23: 'But Shem and Japheth took a garment and laid it upon both their shoulders and walked backward and covered the nakedness of their

father; and their faces were turned away, so that they did not see their father's nakedness' (*New American Standard Bible* 1995).

14. The German term '*Schande*' carries the sense of both shame and dishonour.
15. The term here is '*mondanité*', which is the standard French translation of Heidegger's 'Weltlichkeit'.
16. The term '*fugue*' can also be translated as 'flight' and, like '*fuite*', comes from the Latin term '*fugere*'.
17. My translation of the preceding three lines in part follows and in part differs from Mark Lester's translation in *The Logic of Sense* (Deleuze 1990: 349, n. 5). The most signification difference is that I have translated 'le sens positif' as time's 'forward sense', whereas Lester translates it as 'positive sense or direction'.
18. The term '*liberté motrice*' may be a play on Scheler's notion of 'motor intention', subsequently developed in the work of Maurice Merleau-Ponty, and possibility also on the phrase 'freedom of movement' – *liberté de mouvement*.
19. Stéphanoli's text reads: 'Puisque "que j'aurais sément" que sa contingence rend insupportable. Aucun "ici" n'est prépu être là, mais aussi là et là', tout ici se transforme en un 'ici-précifére à un autre.' My translation follows the changes suggested on the site *Les Amis de Némésis*, with the difference that I change the first 'la' in their '[p]uisque "que j'aurais pu être là, mais aussi là et là"' to an 'ici' in light of the context. See http://www.geocities.com/nemesisite/anders.patholib.htm
20. Nietzsche (1961: 110): 'If there were Gods, how could I endure not to a be God!'
21. 'One thing alone can us from being ourselves cure / Yes... strictly speaking, the question is not how to get cured, but how to live' (Conrad 2002: 153). This passage is notable not only for its significance but for its unconventional and improper grammar, possibly intended to demonstrate one language moving – bumpily – into another. See Sylvére Monad, 'Joseph Conrad's Polyglot Wordplay', available at: http://www.mhra.org.uk/ojs/index.php/MLR/article/view/2/30
22. 'Repetition and memory are the same movement, only in opposite directions; for what is recollected has been, is repeated backwards, whereas repetition properly so called is recollected forwards' (Kierkegaard 1941: 33). In the French, the passage in quotation marks reads: 'mouvement opposé au souvenir' (literally: movement opposed to memory), but Kierkegaard's text suggests that the sense Anders' intended is something more like 'movement in the opposite direction of memory'.
23. In his original note, Anders' references page 14 of Simmel's *Philosophie der Kultur*. The actual title of this text is *Philosophische Kultur: Gesammelte Essais* (Leipzig: W. Klinkhardt, 1911). 'Das Abenteuer', or 'The Adventurer', spans pages 7–24 of this volume. Simmel conceptualises the adventure thusly: 'The most general form of adventure is its dropping out of the continuity of life. 'Wholeness of life', after all, refers to the fact that a consistent process runs through the individual components of life, however crassly and irreconcilably distinct they may be. What we call an adventure stands in contrast to that interlocking of life-links, to that feeling that those countercurrents, turnings, and knots still, after all, spin forth a continuous thread. An adventure is certainly a part of our existence, directly contiguous with other parts which precede and follow it; at the same time, however, in its deeper meaning, it occurs outside the usual continuity of this life' (Simmel 1971: 187–8). On the corresponding page in the English translation, Simmel adds: 'the adventurer is also the extreme example of the ahistorical individual, of the man who lives in the present. On the one hand, he is not determined by any past... nor, on the other hand, does the future exist for him' (Simmel 1971: 190).

24. *Schwerkraft* is the force of gravity; *schwermut* is melancholia. Their shared root, *schwer*, can be translated as 'heavy', indicative of the weightiness and overwhelming force that marks both the force of gravity within nature and of melancholia within an individual life. *Les Amis de Némésis* note this; see http://www.geocities.com/nemesisite/anders.patholib.htm
25. '*À la hauteur de*' can also be translated as 'equal to'.
26. 'Car la definition théorique n'est qu'une ombre que la decision rejette dans le domaine du théorique'. It seems that the second 'théorique' should read 'practique' (practical).

Review Essay
A Stirring Alphabet of Thought

Marcelo Svirsky Cardiff University

José Gil (2008) *O Imperceptível Devir da Imanência – Sobre a Filosofia de Deleuze*, Lisbon: Relógio D'Água.

One might interpret and explain the great philosophers as one pleases, but an honest interpretation must not smother the soul of their oeuvres, however much one may admire or criticise them. Many would agree that Deleuze's writing is often obscure and difficult, and therefore the attempt to introduce some clarity through interpretation must be welcomed. However, too much order can compromise the delicate mechanism of his work and literally freeze its internal dynamics when, for example, concepts and planes of thought are arranged without regard for their links and junctures. In the case of Deleuze, it seems that if anything must be respected, it is the sense of constant movement through the connections that he was able to forge for the benefit of philosophy. This movement is related first and foremost to his critical dwelling on the dogmatic image of thought, which Nietzsche was undoubtedly instrumental in fostering, as Deleuze himself describes in the preface to the English translation of *Nietzsche and Philosophy*:

> And without doubt this is the most important point of Nietzsche's philosophy: the radical transformation of the image of thought that we create for ourselves. Nietzsche snatches thought from the element of truth and falsity. He turns it into an interpretation and an evaluation, interpretation of forces, evaluation of power. It is a thought-movement, not merely in the sense that Nietzsche wants to reconcile thought and concrete movements, *but in the sense that thought itself must produce movements, bursts of extraordinary speed and slowness*. (Deleuze 1986: xii; emphasis mine)

Deleuze's *diagram* is perhaps an apposite concept in this respect: as Williams explains, 'a Deleuzian diagram is an apparatus expressing a series of dynamic transformations . . . these movements are not displacements of things as the effect of forces, but changes in things

as they move and encounter others' (Williams 2008: 79). This constant movement evades the very possibility of capture for the sake of recognition, representation, or static identity. And it is here that José Gil's book scores a major achievement: his writing ties in neatly with Deleuze's agility, because he chooses to interpret Deleuze as a thinker of movement, one who manipulates philosophical concepts, problems and ideas by alternately pushing them away, turning and twisting them this way and that, beyond their intended boundaries, and beyond their previous identities. With Deleuze, there is always a 'Deleuzian movement' of thought. Thus, for Gil, we always find in Deleuze 'a movement of torsion that immediately allows us to contemplate a sphere of difference' (Gil 2008: 30).[1] Viewing thinking as a motion means it is a potentiality – and therefore an action and a critique without transcendent referents (Gil 2008: 166–7). But this torsion of concepts[2] is done not merely for the sake of creating new concepts, but also for the purpose of defining a new field of experience and thought, one marked by excess – that is, beyond the bare empirical exercise of the faculties (Gil 2008: 64–5). And to this end, a proper 'pedagogy of the senses' is required: to educate the senses to discern that which is transcendentally insensible.

But it is more – it is also a matter of language. There is something particularly agile in Gil's Portuguese Deleuze. Perhaps it is the Latin kinship with the French that explains this airy and lyrical version, the sense of the French rhythms. The rhythm and sense of anticipation that Gil's Portuguese instils in Deleuze's philosophy lift the written word above the idiomatic technicalities and rigidities that occasionally stem the flow of Deleuze's prose in other languages. In this respect, Gil keeps the reading in flux, in a state of constant becoming. And yet, in spite of Gil's aspirations, this book cannot be considered an introduction to Deleuze's thought. Although he carefully explores Deleuze's complicated concepts and ideas and offers a rich interpretative language, Gil also does not refrain from embarking upon the complicated task of offering a micro-dynamic of Deleuze's body of thought, thus rendering his book less suitable for novice readers of Deleuze. This is increasingly apparent as one progresses through the book and witnesses Gil's evident mastery of the broad material written by Deleuze (and Guattari), and his ability to crisscross at will the length and breadth of Deleuze's work, and make connections between what he judges to be the different stages and transformations of Deleuze's concepts (Gil 2008: 178). However, in one respect, the book *is* introductory, in that it is not a work in which Deleuze's thought is applied to specific problems in philosophy, politics

or any other field. It is an interpretative work of Deleuze's thought and, seen in perspective, Gil serves as Deleuze's conceptual biographer.

Covering Deleuze's works from before and after his volumes on *Capitalism and Schizophrenia*, Gil greatly expands upon the notion of the plane of immanence as the ontological axis of Deleuze's thought, in a way more suited to experienced readers of the genre. Nonetheless, his writing is clear and makes for pleasant and fluent reading. Thus, for example, as he puts it, the process of learning – as explained in *Difference and Repetition* – is 'the discordant exercise of the faculties divorced (disconnected) from every form of identity' (Gil 2008: 34). In other words, for Gil the activity of learning is something that can never be achieved, but rather only be the focus of constant experimentation.

I. Introduction

Before considering the main arguments of Gil's book, a few preliminary comments are in order. As noted, central to its theme is a Deleuzian exploration of the transcendental conditions of the plane of immanence.[3] To this end, Gil explores the realm in which the conditions for thinking and of real experimentation must be found (thereby underlining Deleuze's distance from transcendental Kantianism, in which these are regarded as mere replications of the empirical). But what exactly do these conditions point to? They allude to the 'invisible which is stronger than the visible forms', Gil argues – to the sub-representative realm of singularities, that is, to the virtual (Gil 2008: 63–4).

According to Gil, Deleuze developed his problematisations through two lines of inquiry. The first was induced by his desire to follow in the footsteps of other great philosophers, from Aristotle to Husserl, to 'rescue the sensible' – but in defiance of tradition, rather than with it. This in turn led to the second, more positive, line of inquiry, in which Deleuze set out to present 'the sensible, or the concrete' as something that is beyond what our physical senses might grasp as concrete. This 'beyond' is defined by Gil as 'the insensible that only may be felt, the unimaginable that only can be imagined' (Gil 2008: 14). It is a terminology that he adopts to designate singularity in concrete experience, that which embodies difference itself. The insensible, however, can only be generated in a field that is distinct from the comparative field of the empirical: it is there that we find the Deleuzian transcendental conditions of experience. For Gil, Deleuze's lines of philosophical inquiry compelled him to build – primarily from *Difference and Repetition* to *The Logic of Sense* – a supportive

topological ontology of difference that connects the concept of repetition with an original reading of the eternal return, culminating in the plane of immanence in his later works with Guattari.

But how exactly does repetition 'open up' the future as a dimension of creation? To put it another way, where lies the habitat of difference? According to Gil, it is the depth of the spatial texture of the eternal return (as opposed to Plato's false depth) or the texture of immanence, which guarantees the logic of excess, the '*produçao do novo*' (Gil 2008: 60). Without this ontology, Deleuze would be unable to offer a dynamic of thought based on nomadic distributions (and away from sedentary distributions of analogy) with which life may be re-thought. As Deleuze writes in the last pages of *Difference and Repetition*:

> Repetition in the eternal return appears under all these aspects as the peculiar power of difference, and the displacement and disguise of that which repeats only reproduce the divergence and the decentring of the different in a single movement of *diaphora* or transport. The eternal return affirms difference; it affirms dissemblance and disparateness, chance, multiplicity and becoming. (Deleuze 1994: 300)

II. Structure and Main Arguments

Over ten chapters and an appendix, Gil's book revolves around the ways in which Deleuze presented a new style of thought, one never anchored in a model or an image. For Gil, Deleuze created a revolutionary alphabet of thought, one always in flux, averting nodes of sedimentation and creating lines of flight. The Deleuzian alphabet of thought is the medium through which we learn to think – it is his 'conceptual machine', with movement as the only vehicle within this medium. This alphabet is also of the field of virtual singularities from which a calculus is forged, and a grammar or a language comes into being in different domains (Gil 2008: 40–2). How does it move and change? While the alphabet's letters are the conditions of intelligibility of the Idea[4] – the elements articulated by the dice in every throw – these conditions change in the face of new problems that emerge with every throw (in every domain). Here the letters must be understood not literally, but as the changing elements of the alphabet, which in turn animates thought. It is an infinite alphabet in terms of its potential combinations: there are always new integrations of letters – 'a genuine machine for the creation of concepts' (Gil 2008: 42). It follows that the Deleuzian alphabet is not a fixed model of construction, but a constantly moving machine of differenciation: 'dislocation of terms, corrections of concepts,

abandonment and adjunctions of other notions – indicating how the alphabet experiences transformations from one text to another, from one work to another' (Gil 2008: 42) (here Gil expands upon Deleuze's concepts, as for example, with the 'Idea' in *Difference and Repetition* and its evolution to the 'Event' in *The Logic of Sense*).

How does this alphabet of thought move one to create and perceive difference? Broadly speaking, Gil answers by structuring and connecting Deleuze's fundamental concepts in the following elliptical and centrifugal fashion: to begin with, a thought of this kind is one of excess, since it always takes itself to its limits; second, multiple logics of excess (life and death, freeing blockades and auto-destruction) are found in what is engendered by the connection and disjunction of divergent series; third, a 'beyond' the organic and the empirical, in which excess or difference circulates and therefore must be localised and described; fourth, this 'beyond' is given by the *n* dimensions of the plane of immanence; fifth, immanence follows the logic of potentiality, the strategy of reciprocal determination between the virtual and the actual (or between sense and the expressed), works from within desire and gives it a plane in which to operate; sixth, and therefore, what emerges is *delirious reality* ('history is delirium'), so immanence is the ontological texture of the real; seventh, the texture of the plane depends on the matter of expression (thought, writing, dancing, etc.), and its transformation (or becoming) is conditioned by rhythmic connections and by consistency between heterogeneous forces; eighth, agency is about microscopic processes of becoming, and not a model to follow (here we find a pillar in Deleuze's significant revolution of thought); and finally, since Deleuzian thought is rhizomatic, it is a thought of excess.

What is a thought of excess? For Gil (Chapter 3),[5] in terms of syntheses of time, excess means to regard the future as the ontological dimension of the new, as an empty form that allows for forgetting and connecting (the task of the eternal return). In terms of energy, excess liberates that which is buried by blockades – unfolded by an inequality or difference in intensities (like erupting volcanoes).

Gil argues that Deleuze's treatment of excess evolves through two different stages. How can we break with the false entropic system with which the world is represented and liberate the intensities? According to Gil, in *Difference and Repetition* and *The Logic of Sense* Deleuze introduces excess as an augmentation of forces that rupture the systems of common sense and the doxa – a norm attacked by a movement of dissolution. Therefore, thought is reterritorialised with a flux of excess breaking with that which it imprisons. Up to this point, it might be said

that the logic of excess operates in a sort of action–reaction fashion, since the line of flight appears as a result of the violence exerted by the excess of external forces. But according to Gil, this logic of thought abruptly changes, to the point where he is able to distinguish between a 'First thought and a Second thought of Deleuze' (Gil 2008: 202). From *A Thousand Plateaus* Deleuze and Guattari put forward a different image of the world: here excess is a part of all systems, creating lines of flight and war machines. The world is machinic at every level or plateau. There is no excess relative to a norm, since every norm is already distorted by a war machine, meaning that there is no state apparatus without lines of flight. Therefore, there is excess everywhere. In other words, the change in *A Thousand Plateaus* in relation to *Difference and Repetition* and *The Logic of Sense* is given by a movement of thought, which introduces immanence within the actual texture of the concepts. This is to the benefit of connectivity, since the tempo of incessant movements within concepts allows not only for internal modifications of components, but mainly for an in between (or opening) to connect across concepts (Gil 2008: 80). But with the advantages, Gil warns, there are also dangers: an excess of excess might appear when immanence is introduced within the texture of the concepts, thus 'an escalation in the flux of variation outlives a boundary, making the flux homogeneous' (Gil 2008: 83). This mechanism, says Gil, explains micro-fascisms and why desire turns against itself, and why the line of flight loses its power of becoming.

The argument goes like this: from the plane of immanence in which everything is in circulation, at certain rhythms and conjugations the plane can be filled with energy of just one type (hate, love, etc.). The excess of this type of energy is equivalent to a drastic reduction in the potential of the bodies (homogenisation takes place) and of heterogeneity. In summary, the excess of energy in the plane of immanence, as excess without limits, transforms the lines of flight (the trajectories of the singularities) into lines of impasse and destruction, and as a result, the power of becoming is lost.

As an example of the transformation of lines of flight into lines of destruction, Gil cites Fernando Pessoa's schizophrenic writing. Pessoa, on whom Gil has written two books and several articles, is one of the most celebrated Portuguese poets. Writing as Alvaro de Campos (one of Pessoa's many heteronyms), Pessoa gives us an image of destruction: 'the self-multitude, producer of multiplicities . . . who multiplies through infinite forms of sense and infinite selves – freezes into an immutable and self-destructive unity' (Gil 2008: 84). The destructive movement is from a centrifugal movement to a centripetal and unifying one,

converging onto the self-individual, emerging after the struggle with the self-multitude. Thus, we have multiple logics of excess: a line of flight might stop blocking concepts, but it might also lead to self-destruction.

To some extent, Deleuze's criticism of Platonism in *Difference and Repetition* undermines Gil's argument regarding the change in Deleuze's thought. On the one hand, Deleuze attacked the dogmatic image of thought in Plato with an external movement of dissolution, to unblock concepts. But on the other hand, for Deleuze the touchstone of Platonism is also its undoing, with Plato himself providing the ammunition. In other words, Deleuze found in Plato an internal war machine that allows for transformation. Although 'Platonism as a whole is erected on the basis of the desire to hunt down the phantasms or simulacra that are identified with the Sophist' (Deleuze 1994: 127), it is the distinction between the two kinds of images (and not between the original and the image) – the copy and the simulacra – that seems to Deleuze to be the decisive junction of a philosophical decision which could have ended otherwise: namely, the decision as to which model Plato chose. The simulacra are the false pretenders, 'demonic images' according to Plato, not eligible for inclusion in the system that measures the copy against the identity of the original Idea. 'Does this not mean, however, that if simulacra themselves refer to a model, it is one which is not endowed with the ideal identity of the Same but, on the contrary, is a model of the Other, an other model, the model of difference in itself from which flows that interiorized dissimilitude?' (Deleuze 1994: 128) Yes, is Deleuze's answer: Plato had sown both models, of the identity of the Same and the resemblance of the Similar on the one hand, and of the terrifying dissimilar on the other. He opted for the former, but also provided the means for criticising this choice, which Deleuze saw and seized upon.

Divergent series (composed of intensities) are in relative displacement, explains Gil, implying a differential correspondence between the elements of the series, a disequilibrium, which is the excess of one series over other (Chapter 4). The emphasis here is on the communication between the series, given that it is through this connection that the excess of forces circulate. This connective element is the 'dark precursor' of *Difference and Repetition* or 'the empty square' of *The Logic of Sense*. It is an intensive element and an active difference. Fernando Pessoa himself, for example, is the dark precursor in his oeuvres: he communicates across the series and assembles the heteronyms through their edges, their margins. This is the significant function of the empty square – its circulation across the series in the structure and the attendant displacement of frontiers – or, in other words, it

is also the significant function of the structure which 'is in fact a machine for the production of incorporeal sense' (Deleuze 1990: 71). The dark precursor as embodiment of difference is decentred, outside itself, dislocated, in constant movement (Gil 2008: 102–6). Pessoa cannot be identified by means of the traditional tools of recognition and representation: *he is not*; he moves. How does the moment of communication take place across the series? Here Gil points out that the *disjunctive syntheses* are the true machine of innovation in Deleuze's thinking of the event (Gil 2008: 18). According to Gil, citing Deleuze's critique of Leibniz's theory of the incompossibles (series 24 in *The Logic of Sense*), he is able to offer an innovative concept of disjunction as the synthetic movement of divergent terms, where the distance between two inherently different terms is breached not by macroscopic wholes but by pre-individual singularities (Gil 2008: 20). The connection or '*ligaçao*' creates difference and introduces variation: this is the Deleuzian definition of the Event.

From this point onwards (starting from Chapter 5) Gil devotes the book to a critique of how Deleuze defines the transcendental as the realm that determines the changing conditions of the possible, and to the 'passage', or the genetic process between the virtual and the actual. Without this realm, it would be impossible for thought to create movement beyond common sense and good sense. The whole question becomes one about how to localise and describe a space for that which is beyond the organic and the empirical – where the intensities from *Difference and Repetition* attest to an ontological-virtual depth. From the perspective of this task, Gil maintains that prior to *Anti-Oedipus* Deleuze had failed to assure univocity of sense through the notion of 'surface'. With Guattari, and following May '68, a second philosophy emerges. A conceptual evolution in Deleuze's thought takes place, and previous concepts are rethought and expanded upon (Gil 2008: 163). It is worth noting that scholars differ in their identification of the various turning points in Deleuze's work. The argument over Deleuze's change following his collaborative work with Guattari and the events of May '68 is well known. But for James Williams, a significant singularity appears with *Logic of Sense*, in which Deleuze experiments 'with a style of writing and a more free approach to the tradition [that] break out and allow novel ideas and a different ethos to guide philosophical thought' (Williams 2008: 77). However, this sort of 'identification' of Deleuze's changes of attitude is instructive in itself, and opens up doors for further analysis and implementation. (It is possible that Deleuze himself would resist even this attempt to 'represent' a passage and the stages used in

this type of interpretation.) This is in contrast to the genealogies through which Deleuze's 'philosophical perfect origins' are usually sought.

According to Gil, in *Anti-Oedipus* and in *A Thousand Plateaus*, the surface is replaced by the plane – as the place where sense is engendered. This plane is what is necessary to provide a basis for the thought of immanence, and the concept of the body without organs (BwO) starts to play a major role in its construction. In *Anti-Oedipus*, the BwO acquires a precision and consistency that it hadn't in *The Logic of Sense*; it is now the plane of immanence. 'A whole battery of new concepts describing the movement of the BwO arises, and it is further developed in *A Thousand Plateaus*' (Gil 2008: 164). The significant change is Deleuze's incursion into the social field and history, and the relationship of the latter to a theory of desire; particularly important is the crossed parallelism between the production of desire, its inscription and reception, and the capitalist production and its recording and consumption (Chapters 7 and 8). According to Gil, most important is the convergence between these two series and the emplacement of the BwO not as a metaphor, but as the socius itself and the place of becomings: desire is the real, and the real comprises desire. The convergence between the desiring-production and the capitalist production is the real. The plane of immanence is the real and it is of the order of production of desire, of capitalist production, and of power, or in other words, history is delirium. This is a new regime of concepts and thought. It is at this point, according to Gil, that Deleuze and Guattari start to perceive thought itself as immanence and as life.

Immanence works from within desire. Desire is a force of composition, an infinite, incessant machine of connection, creation and agency. When we desire, we are on the BwO. Desire needs a space or a plane on which it can circulate: this is the BwO. Here Gil explains Deleuze's choice for Artaud's concept, against the organism, the organised structure. An organism presupposes an organisation of organs, and it is an obstacle to the intensification of free energy. For this reason, the un-doing of the organism is a precondition for the construction of the BwO. It is important to stress that the BwO is not inhabited by the basic units of empirical life, says Gil. He elaborates on this further. For example, the BwO of a writer is not words, but the result of their work on words. Gil maintains that the point of departure to reach a BwO is our empirical body-organism. What we have is just an interpretation of the body, ready to be undone. That is our point of departure in constructing the BwO: our materials are transformable. It has all the necessary materials to be

transformed into another body. The BwO is a body of sensations, and the result of transformation of the empirical body; it lies beyond the empirical body. It is virtual-real. The transformation has an initial phase that is negative: here it is necessary to undo the organism, to combat strata (or opinions); in the second phase we encounter chaos; and finally, a strategy to form the plane of immanence is adopted in order to leave chaos.[6] The construction of a BwO passes through these phases, not necessarily in the linear sequence as explained (Gil 2008: 187). What are the three great strata opposing the construction of the BwO? They are the organism, significance and subjectivity. Against the organism, Deleuze and Guattari propose disarticulation and multiplication of articulations; against signification, experimentation; and against subjectivity – nomadism. There is an important operation in the stage of dissolution of strata, present through the three strata. It is the disorganisation of the order of stratification of the internal organs of a body. In the course of the making of the BwO, we fight against consistency and return to new forms of it. Consistency is simultaneously coexistence and conjunction: in order to have consistency, the elements must be capable of assembly.

> Regardless of the nature of the plane, its construction must provide consistency, necessary for the coexistence of the most diverse elements... because the encounter, the interlacement and the composition of the heterogeneous as heterogeneous is a first condition of creation and of intensification of fluxes. (Gil 2008: 184)

In response to the question where are we supposed to find the weapons (war machines) for the struggle to make a BwO, Gil says that Deleuze is obscure: he addresses voluntarism and the spontaneity of desire at the same time (Gil 2008: 199). It is necessary to *violentar* (to force) the strata that condition the interior of desire, but it is also necessary to *violentar* our thought (Chapter 9). This is why 'to think is dangerous':

> Because in order to think, it is necessary to destroy the strata of good sense and common sense – namely, to destroy normalised thought and generalised opinion; because the philosopher, as the artist, must engage with chaos in order to cut from it a plane of immanence. To enter into the chaos – into doubt, into the 'epoché' and the vertigo of thought – to leave the doxa of the 'natural attitude', implies imposing violence upon the total of common existence. (Gil 2008: 221)

The solution resides in the ideas of chance and encounter. We desire, and leave the strata by virtue of a chance encounter. In a life dominated by strata, adventure always produces encounters that sprout desire.

'All these strategies imply a continuous oscillation between man and his environment; between external forces and the fluxes of the body; between the strata and desire... It assumes a body that is able to combine different kinds of energy with its own... a body capable of taking a line of light, of knowing what is best for itself' (Gil 2008: 200). A body like this forever finds itself partly beyond the strata and partly stratified. At this point, in the manner of other Deleuzians wrestling with the problematic nature of agency, Gil quotes the famous 'non-recipe' recipe: 'This is how it should be done: Lodge yourself on a stratum, experiment with the opportunities it offers...' (Deleuze and Guattari 1987: 161).

Prudence, however, must be adopted to avoid fatally risking ourselves whilst breaking with the strata of the organism, of significances, and of subjectivity. This is why Deleuze insists on prudence, Gil reminds us. According to Gil, 'prudence is not an attitude or a moral prescription, but a technique' (Gil 2008: 188). He considers it a technique of mastering the struggle against the strata. As Deleuze and Guattari warn, to be prudent means to conserve 'small amounts' of organism, of signification and subjectivity. But it is a twofold technique, because those small pieces of strata must be 'reactivated' by breaking them every day. It is a technique that saves us from destruction, while at the same time bringing about the erosion of the dominant strata. In this way we must respond to the dominant reality:

> To maintain small resources of signification and subjectivity, to reproduce the codified game of the social networks every morning, and simultaneously to practice new strategies of struggle, by reproducing the enemy and experimenting with its efficacy. The deliberate repetition of interpretations and subjectivities imposed by the dominant order creates a distance in relation to them and supplies stages on the road to destratification. (Gil 2008: 188)

To what extent is this distance planned and acted upon? How does knowledge (regarding selection of strata to be repeated or forgotten) stand here in relation to chance and spontaneity? If it is a distance between the actual and the virtual, how is unconscious desire accounted for here? If this distance accounts for the critical turn in reactivating the strata, then under which conditions does repetition become an experiment in the beyond? These are perhaps the most troubling questions regarding agency and activism, and in fact, the scholarly literature on Deleuze's thought is mostly mute about them. At the phase where the debate deals with agency, and like many Deleuzian scholars before him, Gil is disappointing. His writing lacks the social and

political landscapes that might enhance the notions of '*agenciamento*' and prudence, and the roles of the BwO. Expectations are hampered by abstract language and by literary examples (from Gil's and Deleuze's works) with a narrow spectrum of political implications.

I will conclude with two themes present at the end of Gil's book: the function of time in the formation of the plane of immanence (Chapter 10), and the notion of becoming (Appendix). The time of immanence is given by the *Ritornello* (*A Thousand Plateaus*), explains Gil. The repetition creates an aperture to a continuation, something that facilitates orientation and calm – 'a beginning of order within chaos'. For example, fieldworks are accompanied with Ritornellos; they work by tunnelling forces of the body to combine with forces of the land. The Ritornello creates a space, a territory, in which forces are selected, combined, joined. It delimits the borders of an internal space, just as a bird might stake out its territory with its songs. In the end, 'a melody becomes a landscape' (Gil 2008: 232). The micro-dynamics of the Ritornello goes in this way: the internal forces of the body must be freed from their biological impulses to allow for expressive combinations. The Ritornello then disconnects itself from the territory which enabled it to become expressive, and it is deterritorialised, acquiring an independent dynamic which allows for new connections with other forces. How do the heterogeneous elements (heterogeneous matters of expression, e.g., body and land, artist and colours and canvas) consolidate? 'To consolidate (consistency) is not about coexisting in proximity, but to engage in articulation, to connect' (Gil 2008: 234). According to Gil, it is the rhythm of the Ritornello that enables matter to capture heterogeneous forces. Capture means transformation of the time of a matter to permit connection with another matter's time. And transformation means becoming.

Becoming is a pre-philosophical condition of a thought of immanence. Becoming is a process of transformation of intensities, and takes place in a zone of the indiscernible. It is where reciprocal transfer of forces and intensities occurs across traditional categories. The molecular dynamic: forces move particles of becoming, creating a relation of movement and repose, through which micro-parts of the body enter into a zone of vicinity of the other's micro-parts. Everything is in a state of becoming, and we are in a perpetual state of becoming of several types. Even the most blockaded entity in a stratum emits virtual particles which places it partially in a plane of immanence. Or, to put it in other way, says Gil, even the most petrified stratum is transversed by lines of flight through which molecular becoming escapes.

> A becoming is not a transformation of form, an 'identification' of an 'I', an imitation of a macroscopic figure (molar). It is a microscopic process (molecular) through which strata are dissolved (with 'I' as a stratum of subjectivity). Between all the kinds, the imperceptible becoming is that which saves us from paralysing molar capture. (Gil 2008: 258).

This brings us to the title of Gil's book. The Deleuzian primacy of the molecular over the molar is there for the purpose of combating recognition and representation, because the imperceptible, the indiscernible and the impersonal cannot be recognised or formally represented (Gil 2008: 260). This is the majestic voice of becoming. The thought of the molecular brought Deleuze to a molecularisation of the thought. The molecular is neither a standpoint nor a scale. It is an objective dimension of the real. To think the real is to think on a molecular level.[7]

Notes

1. Translations mine.
2. The torsion of concepts needs to be understood, according to Gil, as Deleuze's method of critical thinking based on a special form of negation. Rather than negating a concept by its mere categorical opposite, Deleuze applies a movement of critique through which the identity (or the principle) of the foundation (of the concept under critique) is no more sustained (Gil 2008: 27). By this movement of torsion a field of difference is finally opened and affirmed, and this affirmation is in itself the movement of thought. Gil returns to a similar description also for dualisms.
3. Despite Gil's commitment to the theme of transcendental empiricism – articulated by Deleuze from his early writings – it is surprising not to find any reference to Deleuze's book on Hume.
4. Following Deleuze, Gil explains that the Idea cannot be represented or identified. The Idea is a sub-representative virtual multiplicity. Its object is a problematisation and its state of being is 'in movement'. There is a complex field of connection between Ideas. Here the notion of Perplication appears: the differential interrelation of Ideas (clarity and obscurity). The notion of Perplication assumes the internal mobility of the Idea.
5. In Chapters 1 and 2 Gil introduces Deleuze's ontological concepts mainly from *Difference and Repetition* and *The Logic of Sense*.
6. According to Gil, the same philosophical 'logic' is at work in those philosophers Deleuze wrote against: Plato, Descartes and Husserl (Gil 2008: 201). What distinguish Deleuze from the metaphysical philosophers is that he is after how to acquire consistency without lose the infinite where thought is immersed. If the infinite movement of thought is not stopped – where infinite is the condition of immanence – explains Gil, then the transcendental cannot be introduced (Gil 2008: 203). 'Therefore, the first big difference consists in the way we handle chaos: either it is negated, excluded (as with Descartes), or the movement and the infinite velocities that animate concepts are extracted from it' (Gil 2008: 203). The second difference resides in the fact that the circulation of concepts on the plane of immanence are aleatory; they don't obey any law, rule or a

despotic signifier, but only the chance of the encounter – 'the ideal game of the eternal return'. There are nomadic movements and not fixed trajectories on a map in which the territorial distributions are determined by categories; this is a philosophy of difference in which everything changes (Gil 2008: 203). Then, if the concept is a movement of thought, how was it possible to handle it as a static representation?

Capital, Crisis, Manifestos, and Finally Revolution

Dhruv Jain York University

Gilles Deleuze, in an often-cited interview with Antonio Negri, says that both he and Félix Guattari are Marxists. Deleuze insists: 'I think Félix Guattari and I have remained Marxists, in our two different ways, perhaps, but both of us' (Deleuze 1995: 171). However, this spectre of Marx haunting Deleuze's works, both individual and collaborative, has yet to be fully reckoned with, although commentators such as Eugene Holland, Jason Read and Nick Thoburn have all made significant strides in mapping the important contours of this philosophical and political relationship (see Holland 1999; Read 2003; Thoburn 2003). Thus, once again we intervene in the middle, in the middle of a discussion that has already begun and indeed did not simply begin in the heady days of 1968. But the situation in which this intervention is being made could perhaps not have been more timely, as we globally experience the deepest and most crippling economic crisis since the Great Depression. Indeed, Capital is no longer undergoing the simple popping of some temporary economic bubble, as with the dot.com or housing bubbles, or even the credit crunch (even if all these contributed to the current erosion of the economic and social base); rather, it is undergoing a crisis. Yet forces on the 'Left' remain unable to provide an appropriate response. Over a century and a half ago, Marx and Engels ended the *Communist Manifesto* with 'Workers of the World, Unite!', and yet we remain as fragmented as before, indeed we remain a 'sack of potatoes'. It is these very forces on the Left who stubbornly argue that the need for a rethinking of the Marxist project outside of orthodox texts – Lenin, Luxemburg, Trotsky, Mao, and so on – is not only unnecessary but indeed constitutes heresy, yet simultaneously argue that it is only they who creatively apply Marxism to their particular conditions while being painfully aware of their increasing marginalisation in contemporary politics. It is in this stagnant and stultified context that Deleuze and Guattari's work becomes pivotal. They put forward a Marxism that rejects many of the essentialist, evolutionist teleologies that have

burdened Marxist theory for so long, while remaining committed to the Marxist project for emancipation in the wake of the failures of orthodox Marxist State-building projects.

The contributors to this volume do not claim to be presenting a totalising whole (indeed a rejection of the totalisation of life is a consistent theme in many of the essays), or to be providing a manifesto or a party programme; nor are they necessarily in agreement over the nature of Marx's influence on Deleuze and Guattari's thought, or the appropriate Deleuzian strategy by which to change the world. Their essays do, however, constitute in their different ways 1) a serious attempt to demarcate Deleuze and Guattari's relationship to Marx and to discern which useful tools for analysis and for action must be appropriated from Marx's methodology; 2) an honest appraisal of the current situation, including problems of the State and the structure of Capital and capitalism; 3) an attempt to demarcate a strategy arising from Deleuze and Guattari's rethinking of the Marxist project. Only through discussions and debates such as these might an appropriate revolutionary theory and guide to political praxis be worked out, in line with Lenin's famous maxim that 'Without a revolutionary theory there can be no revolutionary movement' (Lenin 1973: 28).

In their respective contributions, Simon Choat, Aldo Pardi and Aidan Tynan each attempt to fully draw out the relationship with Marx through very different gestures: both Choat and Tynan see Deleuze and Guattari as being essentially the inheritors of the Marxist tradition, while rethinking significant sections of the Marxist ideological corpus such as the relationship to Hegel and the 'mode of production'. Choat grounds his analysis in Deleuze's *Difference and Repetition* and *Nietzsche and Philosophy*, arguing forcefully against depoliticised readings that produce an 'apolitical' or liberal Deleuze. Indeed, rather than claim that any appearance of Marx in Deleuze's intellectual oeuvre can simply be seen as a result of Guattari's influence, Choat argues that Deleuze's troubled relationship with Marx and Hegel is already evident in *Difference and Repetition* and *Nietzsche and Philosophy*. Choat provocatively suggests that any hesitation on Deleuze's part in endorsing Marx arose not from a fear of over-radicalism, but from a doubt as to whether Marx was radical enough in comparison to Nietzsche. Furthermore, Choat shows how Deleuze and Guattari's excavation of Marx's theory of universal history, while rejecting its inevitablism and teleology, results in a necessary re-conceptualisation of the structure of capitalism itself. This re-conceptualisation relies on Deleuze's interrogation of Hegel's dialectic, vis-à-vis the problem of

representation, and the rejection of the concept of contradiction. It also results, Choat argues, in a reformulation of other Marxist concepts such as that of 'modes of production'.

Tynan, for his part, follows the shifts in Deleuze's thought between *Difference and Repetition* and *Logic of Sense* to *Anti-Oedipus*, focusing on the relationship to Marx's *Capital* and other works critiquing political economy, again addressing the problem of the 'mode of production', taking up where Choat left off. Indeed Tynan asserts that Deleuze's 'philosophy of difference' is compatible with desiring production. Furthermore, while marking different contours in the Deleuze–Marx relationship than does Choat, Tynan argues that Deleuze is attempting to engage in an 'immanentisation of Capital' through an analysis of four constitutive moments of the Capital circuit: production, distribution, surplus-value and consumption. Tynan does not attempt to crudely reduce Deleuze's terminology to Marx's, but rather demonstrates how the new vocabulary developed by Deleuze and Guattari allows for a re-establishment of Marxism within a different set of intellectual parameters. Radically, Tynan suggests that Deleuze and Guattari are fundamentally engaged in the same intellectual strategy as was Marx, in so far as, through abstraction from empirical data, they are able to perceive general laws, in particular in relation to the role of desire. For example, they are able to show how Capital's tense relationship to production and reproduction is mediated through desire and the connective-synthesis of desire to Capital, or desiring production. The role of the State is thus to regulate and absorb debt while also coding society, allowing for the axiomatisation of capitalism.

Pardi displaces the relationship from being that of progeny to that of ally, presenting Marx and Deleuze as intellectual and political allies seeking to address the same problems. Thus rather than focusing on the reformulation of specific features of Marx's analysis in Deleuze's work, the existence of which Choat and Tynan have well demonstrated, Pardi focuses on a second encounter with Marx, occurring after the intellectual 'deconstructive detour of transcendence and the thought of the One'. Indeed Marx here appears as an initial and essential entry point into the central problem of ontology which, Pardi suggests, must be situated within the grid of need/production and subject/society, it being this very grid that allows for the establishment of a 'definition' of the 'transcendental coordinates of the existent'. Pardi argues that Deleuze is attempting to deal with the problem of liberation posed necessarily in juxtaposition to Hegel's unified totality, and that traditional Marxism is inadequate in and of itself to accomplish such a task. Pardi

reassembles Deleuze's intellectual framework – Bergson, Kant, Spinoza and Nietzsche – in constructing the intellectual line of flight necessary to construct an adequate response. It is at this point that Marx returns to Deleuze's side: the Marx of the revolution and the struggle for new modes of production and a new society. This is not simply a political affinity, but a theoretical recognition of the revolutionary content of the critique of the unified totality as being a configuration of forces that constitutes a specific 'mode of production', and of the field of politics as a competition of different forces of production. The configuration of forces on the field of politics determines the form of State that is produced and the resulting socius produced by the State.

Jason Read picks up this emphasis on the concept of 'mode of production' in his essay, analysing its relationship to the 'image of thought', and addressing the problem of the relationship between materiality and abstraction. Indeed, Read examines more closely the theoretical methodology that, according to Tynan, Deleuze appropriated from Marx himself. Deleuze, Read argues, attempts to arrive at a new definition of revolutionary thought that attempts to immanentise revolution as an exceeding of society as fetish, rather than take refuge in the traditional Marxist proposition that one must seek the conditions of the future revolution in the present situation. Read points out that while Deleuze rejects Althusser's emphasis on ideology, he simultaneously revives Marx's concept of 'commodity fetishism' as a model which critiques the form and the limits of thought itself, and not merely the 'empirical limits of error'. Indeed, Read points out that Deleuze, in agreement with Althusser, recognises that the economy is the determination of a problem which is solved through differential relations rather than through historical necessity or the determination of the base. These differential social relations are in the virtual. Read then also briefly turns to the problem of the State to argue that the latter is itself an image of thought – a position consistent with Pardi's claim that the State is the configuration of forces not simply in the economy and social relations, but also in the determining field of politics itself.

Thus far, we have been presented with different, albeit not incompatible, analyses of the State and of Capital. We have noted the numerous different lines of flight and contours that Deleuze and Guattari map in relation to Marx's work. Furthermore, each author has argued that only through a change in social relations can there be an achievement of liberation. The Deleuze and Guattari presented thus far have been Marxists who seriously appreciate the need for a revolutionary politics. However, thus far a strategy for such a

politics has been lacking. The basic question: 'What is to be done?' remains unanswered. Eduardo Pellejero and Guillaume Sibertin-Blanc, in their respective essays, reflect on this lack and seek to formulate Deleuzian strategies of revolt. Both locate Deleuze and Guattari's revolutionary theory in the concept of 'minority' and 'becoming-minoritarian', although in differing ways.

Pellejero attempts to discern a Deleuzian praxis allowing for a liberatory politics that results in the 'detotalisation of life'. Pellejero poignantly reminds us that Deleuze re-reads Marx in light of the failures of already existing regimes, especially the Soviet Union, and argues that 'the minor', or the line of flight, which has been attempted thus far in traditional political movements has not developed in revolutionary ways. In fact, it has allowed only for the subsumption of those revolutionary movements under the sign of Capital. Thus, we cannot and must not return to the field of politics utilising a revolutionary strategy that re-conceptualises politics outside of the narrow band of power determined by the simplistic binary of Government and Opposition; rather, we must reject 'the totalisation of life by power' through an affirmative politics of revolutionary-becoming arising from the immanent event and not grounded in a utopian vision in which all of History is realised. Indeed, Pellejero controversially argues that 'power formations are inhabited by an essential powerlessness' that is incapable of capturing all the micro-moments of resistance, creativity and transformation. Revolution, as Pellejero further argues, is no longer the Event in itself, but is, rather, a process of becoming. No longer can we hold onto the utopias of the past that must be realised; we must, rather, recognise that the revolution is a continuous 'everlasting' process. Rather than invoking merely an empty catch-phrase, Pellejero asserts that this 'revolutionary-becoming' must occur through 1) the envisioning of differential possibilities; 2) the creation of new assemblages for the realisation of the revolutionary praxis; and 3) the articulation of new revolutionary lines of flight.

Sibertin-Blanc addresses the concept of 'becoming-revolutionary' by grounding his analysis of Deleuzo-Guattarian praxis in minorities. Sibertin-Blanc recognises that the contours of capitalism, the State and the contradictions within these assemblages gesture towards the problem of the 'collective subject' and of its articulation as 'proletarianisation' and 'minoritarianisation'. Sibertin-Blanc reminds us that one should not romanticise becoming-minoritarian since Capital, for example, minoritises flows that cause famine. Capital's minoritarian axioms result in a double process: 1) the formation of class assemblages and resistance;

2) the formation of minorities and the manipulation of their positions within the national economy and society that allows for particular forms of manipulation. Sibertin-Blanc differs from Pellejero in his attempt to rearticulate and re-conceptualise traditional revolutionary movements. Despite the intimate connection between 'proletarian' and 'minority', Sibertin-Blanc is quick to point out that we cannot simply collapse these movements into an undifferentiated series of working-class struggles, and that revolutionary minoritarian movements must remain independent of the State. Indeed, this push for autonomy parallels Pellejero's argument that revolutionary movements should not be encoded within the binary of the State and an Opposition that simply attempts to capture State power. He points out, however, that the problem of minorities remains that 'minoritarian sets are immediately constituted in the State-form'. He shares Pellejero's call for the formation of new assemblages, but also emphasises the need for an accompanying minoritarian 'culture, thought and practices'. It is in this context that Sibertin-Blanc argues that minoritarian movements have been revolutionary in so far as they have challenged both capitalist axiomatisation and the modern State-form through troubling the basic borders that demarcate that form: for example, the national/exterior boundary by which an influx of immigrant populations results in the production of a discomforting resident foreigner, or the individual/collective boundary arising from the relationship between the majoritarian (or national) subjectivity and the 'subjective position of the minority'. Again, the struggles of minorities are not revolutionary in and of themselves, and an evaluation must be made within the context of the situation in which they find themselves. Sibertin-Blanc then turns to the need for a 'minoritarian internationalism' capable of responding to the historical task that it faces, but without resorting to the State-form.

What I have given here is not a tracing of the arguments as carefully laid out by the authors in their respective essays, but is rather a single mapping of this collection as concerned with the problems outlined above: 1) the intellectual relationship between Deleuze and Guattari and Marx's work and methodology; 2) the contours of modern capitalism and the State-form; and 3) the appropriate strategy for realising liberation. Indeed, authors and readers alike may be uncomfortable with the particular connections between essays I have made, and I urge readers to arrive at their own intellectual assemblages. It is these various connections between the essays, but also their links to other literary machines, revolutionary minoritarian movements and new

social assemblages that will allow for the further development of the revolutionary theory needed.

What is clear from this collection, however, is that Deleuze's claim that he and Guattari are Marxists is grounded in a common project they share with Marx, namely, that of liberation from the 'totalisation of life' by capitalism and its accompanying State-form. From Marx they also adopt the methodology of peering into the particular with a view to discerning the abstract; and, while remaining loyal to many of Marx's key propositions, they are able to rethink his analysis of capitalism, society and the State without recourse to the more vulgar economic determinisms that have been endemic to the Marxist movement. This reinterpretation of the world is accompanied with a re-thinking, in light of previous failed attempts, of what political strategies might be adopted and followed in order to change the world. It is clear that we cannot work within the parameters of the formal political structures currently in place, since they are constituted by the very capitalist axiomatisation and stratified State-politics that have resulted in our being everywhere in chains. Furthermore, we cannot simply cling to the worker movements of the past. We must, rather, develop and work immanently within social movements that allow for the development of new social assemblages capable of demonstrating that another world is indeed possible.

Deleuze, Marx and the Politicisation of Philosophy

Simon Choat Queen Mary, University of London

Abstract

Against those who wish to marginalise Deleuze's political relevance, this paper argues that his work – including and especially that produced before his collaborations with Guattari – is not only fundamentally political but also profoundly engaged with Marx. The paper begins by focusing on different possible strategies for contesting the claim that Deleuze is apolitical, attempting to debunk this claim by briefly considering Deleuze's work with Guattari. The bulk of the paper is concerned with a close examination of the appearance of Marx in both *Nietzsche and Philosophy* and *Difference and Repetition*, establishing that the 'pre-Guattari' Deleuze was fully engaged with both politics and Marx and demonstrating that the concepts and arguments of the Marxist politics of the Deleuze–Guattari books can be traced back to Deleuze's own work. It is argued that an analysis of Deleuze's work on Marx is significant not only for deepening our understanding of Marx, but also for understanding the possibilities for Deleuzian politics.

Keywords: Deleuze, Marx, Nietzsche, philosophy, politics, social machines, capitalism

In some ways Deleuze's unfinished book on the *Grandeur de Marx* – the book that shortly before his death he announced he was working on (Deleuze 1995a: 51) – leaves us with a frustrating gap in our knowledge of his work: there is no text on Marx to compare with those on Spinoza, Nietzsche, Bergson, and so on. On the other hand, it might be better to think of *Grandeur de Marx* not as some kind of missing key, but rather as an unnecessary distraction: speculation about the content of the lost book brings with it the risk of drawing attention away from the presence of Marx in Deleuze's published writings. Rather than using the book on Marx as a touchstone by which Deleuze's Marxist credentials can be safely guaranteed, it may be better to focus on what we know Deleuze

has actually said about Marx. This, however, is not as easy as it sounds, for in fact Deleuze himself wrote little about Marx: of all his works, it is those jointly authored with Félix Guattari, particularly the two volumes of *Capitalism and Schizophrenia*, that are most obviously influenced by and comment most often upon Marx. The problem with relying on the joint works is that it leaves open the suspicion that Deleuze was not a Marxist at all, and that the Marxism was all Guattari's: a special case of the claim that Deleuze was not a political thinker at all, the politics being all Guattari's.

Against this suspicion, I shall argue that the interest in Marx comes just as much from Deleuze as from Guattari. Much fascinating work has been done by commentators who have taken Deleuze and Guattari's Marxism seriously, substantially advancing our knowledge of Marx as well as of Deleuze and Guattari.[1] But rather than looking at the books written with Guattari, I want primarily to examine the references to Marx in Deleuze's solo writings, focusing on *Nietzsche and Philosophy* and *Difference and Repetition*. Doing so can help demonstrate that even before he began collaborating with Guattari, Deleuze's work was both deeply politicised and engaged with Marx. Indeed, these two things are in some senses inseparable: Deleuze's philosophy was deeply politicised because it followed in the footsteps of Marx, the thinker who more than any other politicised philosophy. If we want a political Deleuze or a Deleuzian politics then a good place to start would be by recognising the place of Marx in Deleuze's work. This recognition must, however, be made against those who claim that Deleuze's own work is not political.

I. Deleuze and Marx

There have been numerous strategies for rejecting Deleuze as a political thinker: deferring the political moment until the Deleuze–Guattari books, dismissing his political formulations, explicitly denying the political relevance of his work, or simply ignoring his political pronouncements in favour of something else.[2] Perhaps the strongest allegation that Deleuze is not a political thinker comes from Slavoj Žižek, who claims simply that there are no politics in Deleuze's own work: 'It is crucial to note that *not a single one* of Deleuze's own texts is in any way directly political; Deleuze "in himself" is a highly elitist author, indifferent toward politics.' Any direct political moments are, according to Žižek, only found in those books co-authored by Guattari, whom Žižek names as a 'bad influence' on Deleuze (Žižek 2004: 20).

Žižek argues that Deleuze's solo texts, while in themselves strictly apolitical, contain the potential for the development of a different materialist, even Marxist, politics. Žižek contrasts this potential politics both with the supposed idealism of the Deleuze–Guattari books and with what Žižek sees as the dominant form of Deleuzian politics today, namely a Hardt and Negri-style politics of the Multitude. Hence for Žižek, while we can find both Marx and politics in the Deleuze–Guattari books, they are there only as a result of the (bad) influence of Guattari, soaked in a pernicious idealism and productive of an inane political standpoint; whereas when we read Deleuze 'in himself' we are not dealing with a political thinker at all, let alone a Marxist. Against Žižek, however, it can be shown that Deleuze's own work is both already politicised and engaged with Marx – and that this work anticipates the Marxist politics of the later collaborative work. There are a number of strategies that could be pursued in order to establish this point.[3]

One way to counter Žižek's image of an apolitical Deleuze is simply to think about the composition of the Deleuze–Guattari books, their literary construction. A few small clues help undermine the notion that in this partnership Guattari was the Marxist revolutionary and Deleuze the dry, apolitical philosopher subject to bad influences. Deleuze has presented himself as a 'lightning rod' for Guattari's thoughts, systematising things by bringing together and ordering Guattari's inventive but chaotic ideas (Deleuze 2006: 239). If we accept this image, then it can be seen that the analysis of capitalism in the Deleuze–Guattari books – rigorous, methodical and systematic – bears all the hallmarks of Deleuze's style: given how profoundly indebted to Marx this analysis is, this suggests that Deleuze as much as Guattari was deeply engaged with Marx. This intuition finds some support in the correspondence between the two authors. During the writing of *Anti-Oedipus* Guattari wrote to his friend: 'I have the feeling of always wandering around alone, kind of alone, irresponsibly, while you're sweating over capitalism. How could I possibly help you?' (Guattari 2006: 137). These are hardly the words of someone who has imposed his Marxism on a passive or indifferent collaborator. Rather, they suggest that we should take Deleuze at his word when he claimed: 'I think Félix Guattari and I have remained Marxists, in our two different ways, perhaps, but both of us' (Deleuze 1995b: 171).

Elizabeth Garo has noted suggestively that it is somewhat peculiar for a philosopher so committed to processes of becoming to claim to 'remain' a Marxist: 'For a thinker of becoming, remaining cannot be a very stimulating objective but, at most, a slightly disenchanted and

necessarily sceptical stance' (Garo 2008a: 609). But – aside from the fact that we should not put too much weight on the casual use of a particular word in what was an interview – 'remaining' does not necessarily imply static adherence or loyalty. The very fact that it is possible to remain Marxist in 'two different ways' implies that this is not a question of stubborn or sheepish attachment to a given dogma, but rather of an active interpretation of the Marxist heritage: a dynamic process in which neither he who remains nor Marxism itself stay the same – less a question of remaining Marxist than of becoming-Marxist. Evidence that Deleuze's claim to have remained a Marxist indicates a renewed commitment to Marxism is also provided by the historical context: it was a way of distancing himself from the violent reaction against Marx that took place in France after 1968, when the *nouveaux philosophes* competed with each other to renounce Marx and Marxism. To remain a Marxist when those around you are denouncing Marxism as the philosophy of the gulag is a profoundly political act – as Garo herself recognises (Garo 2008b: 66; 2008a: 614).

There are other reasons, however, why picking over the details of how *Capitalism and Schizophrenia* was written is unsatisfactory as a response to Žižek's charges. For a start, although it may tell us a little about Deleuze and Guattari's respective contributions, it risks misrepresenting their work, implying a clear division of labour between two isolated contributors. This was not the case at all; as Deleuze said of their relationship: 'we do not work together, we work between the two' (Deleuze and Parnet 2002: 17). Hence, rather than focusing on the Deleuze–Guattari books, it may be more productive to turn to Deleuze's own work, establishing a continuity between this early work and the later collaborative texts. For while the co-authored books may be the most obviously political, the themes, concepts and arguments of those books emerged out of Deleuze's solo work.[4] The rejection of dialectical notions of negation and contradiction, the Nietzschean affirmation of active over reactive forces, the ontology of pure difference, the understanding of being in terms of multiplicity, the imperative to highlight the virtual conditions of all actually existent beings – all these ideas came from Deleuze, so it is senseless to claim that the later, 'political' work with Guattari is somehow a break with or regression from the supposedly apolitical work that preceded it. Rather than pointing to broad themes, however, it is possible instead to look for Marx in Deleuze's early work: this search can show that the specifically Marxist politics of the later books can also be traced back to Deleuze, who was writing on Marx long before he met Guattari, in addition

to demonstrating that to 'remain Marxist' was not merely an act of resistance when surrounded by apostates but also a creative use of Marx. Perhaps the two most prominent appearances by Marx in Deleuze's pre-Guattari work occur in *Nietzsche and Philosophy* and *Difference and Repetition*.

II. Marx and Nietzsche

Nietzsche and Philosophy gives the lie to the claim that Deleuze is an apolitical thinker: this is a highly politicised Nietzsche, in at least two senses. First, Deleuze's theoretical reconstruction of Nietzsche presents him as a political thinker worth reading: a novel claim at a time when Nietzsche was dismissed by many as at best an individualist forerunner of existentialism unconcerned with broader social and political issues and at worst a proto-fascist whose politics should be unequivocally rejected. Second, Deleuze's book itself had wider political consequences, playing a vital role in facilitating the introduction of Nietzsche into political thought in postwar France. It is worth considering the manner in which Deleuze politicises Nietzsche before examining the role that Marx plays here. Deleuze argues that, like Kant, Nietzsche offers a critical philosophy. But Nietzsche goes much further than Kant. While the latter undertakes a critique of the forms and claims of knowledge, truth and morality, he does not criticise knowledge, truth and morality themselves: they remain outside critique, acting as transcendent standards that are used to measure, judge and ultimately denounce life. Kant's critique is thus fundamentally compromised and is effectively a form of nihilism, depreciating and denying that which exists in the name of another, superior world. Nietzsche, in contrast, replaces the question of truth or falsity with the problem of forces and power: no longer an attempt to establish the essence of truth in order to judge life, philosophy now pursues an interpretation of the forces that give sense to things and an evaluation of the will to power that gives values to things (Deleuze 1983: 54). Rather than seeking to determine the essential nature of a thing, 'essence' itself must be recognised as the result of the forces and powers that take hold of a thing. What Nietzsche seeks, according to Deleuze, is a 'thought that would *affirm* life instead of a knowledge that is opposed to life' (Deleuze 1983: 101). This does not mean that we simply indulge in a celebration of everything that exists. Genealogy is at once interpretation and evaluation: forces can be active or reactive and the will to power can be affirmative or negative. As affirmation of life, thought must reject all *ressentiment* and

take a genuinely critical stance that can explain and subvert reaction and negation. Philosophy's role is therefore not to establish timeless principles but, in Nietzsche's phrase, to be 'untimely': to remain vigilant in upsetting existing values and institutions.

Deleuze's Nietzsche is political because he reveals that apparently stable and immutable values and institutions are products of struggle between competing forces and powers, and in doing so he undermines the established order and points to the possibility of a different world. This politicised philosophy is sharply contrasted by Deleuze with the piety of Hegelian dialectics, which effectively acts as a functionary of the Church and the State by sanctioning the present order. Whereas dialectics can only recognise what is already established, Nietzsche seeks to create the new. It is in his discussions of the relation of Nietzsche to dialectics that Deleuze introduces Marx. Nietzsche and Marx are placed in a provisional alliance with the claim that they both found their 'habitual targets' in 'the Hegelian movement, the different Hegelian factions' (Deleuze 1983: 8). As it stands, this claim does not necessarily imply approval of Marx's project by Deleuze: the claim is not that Marx targets Hegel as well as the Hegelian factions, nor that Marx's critique of Hegelianism is identical to or even compatible with Nietzsche's critique. It does, however, suggest that it might be interesting to pursue the relation between Nietzsche and Marx – and this suspicion is rewarded by further examination of *Nietzsche and Philosophy*, as Marx makes a number of cameo appearances. Deleuze clearly recognises that Marx's relation to Hegel is more complicated than is Nietzsche's. At one point he draws a parallel not between the attitude of Nietzsche and Marx towards Hegelianism but between their attitudes towards Kant and Hegel respectively: 'Nietzsche stands critique on its feet, just as Marx does with the dialectic.' He goes on to add, however, that 'this analogy, far from reconciling Marx and Nietzsche, separates them still further' (Deleuze 1983: 89). They are separated still further because while Marx was trying to stand dialectics on its feet Nietzsche rejected dialectical thinking altogether. This comparison neatly captures Marx's place in *Nietzsche and Philosophy*: intriguing hints about possible connections are quickly complicated or undermined, leading to what can look like a dead end, yet with the possibility of further links never entirely foreclosed. Marx is posed a series of challenging questions by Deleuze, either directly or implicitly. Is Marx trying to save the dialectic from sliding into nihilism or does he join Nietzsche in defeating it? Is Marx, like Nietzsche, interested in inventing new possibilities of life, or is he engaged in a nihilist subordination of life to transcendent values, driven

by the spirit of proletarian *ressentiment* and hoping to return to the working class what is rightfully theirs? Is negation in Marx an active self-destruction, or is he caught up with the concept of contradiction, unable to recognise more subtle, fluid forces? That these questions are left largely unanswered in the Nietzsche book should not lead us to conclude that Deleuze has no answers, or that they are posed rhetorically as a way of confronting and condemning Marx. These questions do not suggest a rejection of Marx by Deleuze, or a lack of interest in Marx. Instead they suggest that he was grappling with Marx, and that if he was reluctant to endorse him fully then this reluctance did not come from an elite indifference towards politics but, on the contrary, from a fear that Marx's political position was not radical enough: that compared to Nietzsche, Marx did not go far enough.

That Deleuze had such fears is hardly surprising, and can be explained (at least in part) by the intellectual and political context within which he wrote. Given the somewhat dismissive attitude toward Nietzsche in France in the immediate postwar period, Deleuze could come to him relatively fresh. Marx, on the other hand, laboured under a joint burden: stifled by a sclerotic Stalinism within the PCF, and anaesthetised through official sanction within the academy. In both realms, Marx was also eventually aligned with a Hegelian humanism. Within academic circles, various factors led thinkers like Sartre and Goldmann to forge a humanist Marxism. (These factors included but were not limited to: the lectures and writings by Kojève and Hyppolite; the interest sparked by the release of Marx's early writings; and the translation into French of Marxists like Lukács, Korsch and Marcuse.) This trend was then mirrored in the PCF as its leading theorist Roger Garaudy sought an alternative to Stalinism for the Kruschev era. Given all this, it would not have been surprising if, in his attempt to generate a new, post-humanist and non-Hegelian philosophy of difference, Deleuze had rejected Marx completely. Deleuze's contemporaries dealt with the situation in different ways. Michel Foucault made a conscious and conspicuous effort to distance himself from Marx and Marxism (even while simultaneously continuing to draw upon Marx's conceptual innovations). Jacques Derrida was more or less silent on Marx until *Specters of Marx* was published in 1993, at a time when reference to Marx could act as a useful codeword for resistance to a newly triumphant neo-liberal hegemony. Jean-François Lyotard and Jean Baudrillard effectively abandoned Marxism altogether. For Deleuze to continue to speak favourably of Marx in such an environment is in itself highly significant.

That the tentative attempts in *Nietzsche and Philosophy* to link Nietzsche and Marx are more than idle speculation is confirmed in an interview from 1968 in which Deleuze maintains that both Marx and Nietzsche offer 'a radical and total critique of society': not a reactive, negative critique but one that is the prelude to an equally radical moment of creation: 'a great destruction of the known, for the creation of the unknown' (Deleuze 2004a: 136) – essentially what Deleuze himself calls for. *Nietzsche and Philosophy* can tell us not simply that Deleuze was engaged with Marx before he collaborated with Guattari, however, but also something about the kind of Marx that Deleuze was interested in. Indirectly, we can make comparisons with the manner in which he reads Nietzsche. Deleuze *uses* Nietzsche rather than merely interpreting him, producing a specifically Deleuzian Nietzsche in whom it is almost impossible to discern where Deleuze ends and Nietzsche begins. This is not a playful eclecticism in which Deleuze chooses and combines elements of Nietzsche's work more or less at random, but a systematic reconstruction of Nietzsche's philosophy. This approach mirrors Deleuze's readings of other thinkers, and we might anticipate that he will read Marx in a similar way: reconstructing a Marx who is recognisably Deleuzian but who is nonetheless drawn from the heart of Marx's work. Clearly this Marx will be one separated from the dialectical method: it cannot be a Marx for whom historical change is driven by society's contradictions. Equally, a Deleuzian Marx must avoid offering an idealist judgement of life using transcendent standards, yet without on the other hand capitulating to a relativism that uncritically accepts things as they are: he must instead undertake an immanent critique that challenges the established order.

This is the Marx that we find in *Anti-Oedipus*, where Deleuze and Guattari pursue the allusive connections between Marx and Nietzsche that are found in *Nietzsche and Philosophy*. Marx is arguably the key influence upon *Anti-Oedipus*, though it is a Marx transformed by being filtered through numerous other thinkers, including Nietzsche. Perhaps the most obvious example of this double reading of Marx with Nietzsche is found in the book's adaptation of Marx's universal history: this is not a Hegelianised, totalising history in which capitalism is the inevitable culmination of a necessary process of historical development, but rather a kind of Nietzschean genealogy of capital: 'universal history is the history of contingencies, and not the history of necessity. Ruptures and limits, and not continuity' (Deleuze and Guattari 1977: 140). By using universal history, Deleuze and Guattari claim, it is possible 'to retrospectively understand all history in the light of capitalism'

(Deleuze and Guattari 1977: 140). Yet rather than being an imposition upon Marx, or a simple hybridisation of Marx and Nietzsche, this conceptualisation of universal history comes directly from Marx's work itself, or at least a part of it. In the *Grundrisse* Marx argues that bourgeois society provides the key to understanding all previous societies. He uses a well-known analogy to make his point: 'Human anatomy contains a key to the anatomy of the ape. The intimations of higher development among the subordinate animal species, however, can be understood only after the higher development is already known' (Marx 1973: 105). Rather than an attempt to naturalise historical development, this passage should be read as Deleuze and Guattari read it: as a rejection of teleology and recognition of the uncertainty and irregularity of historical development. Human anatomy can help us understand apes not because apes are destined to become humans but because humans have developed from apes; likewise, bourgeois social relations can illuminate previous social forms not because they were predestined but because bourgeois society has developed out of social formations that have now vanished and yet whose traces are still carried within capitalism. Bourgeois political economists were able to formulate the category of labour in general – a category that could then be used to analyse previous social forms – because under capitalism labour has in reality become generalised, as deskilled labourers separated from the means of production (or deterritorialised, to used Deleuze and Guattari's language) move regularly from one type of work to the next. This creation of a propertyless labour force was not the result of a preconceived plan but of entirely contingent circumstances, as a peasantry that had been forced from its land for quite different and varied reasons was then incorporated into a production process that required them as a precondition: the emergent capitalist class thus made 'use of events in which they had played no part whatsoever' (Marx 1976: 875). The history of capitalism according to Marx is a history of rupture and contingency, not necessity.

Just as they modify Marx's universal history, so do Deleuze and Guattari modify his analysis of capitalism. Where Marx seeks to expose the contradictions upon which capitalism depends yet which will ultimately be its undoing, Deleuze and Guattari instead analyse capitalism in terms of its deterritorialising and reterritorialising tendencies. In doing so they maintain Marx's focus on the tensions within capitalism – between, for example, its subversion of all traditional political institutions and forms of authority and its simultaneous need for such institutions and forms to enforce the established order – yet

without understanding them in terms of contradictions that will ultimately be superseded and resolved. If Deleuze does not understand capitalism in terms of resolvable contradictions, then nor does he posit an 'outside' to capitalism that could act as both a transcendent standard of judgement and a point of potential resistance (be it unalienated labour, pure use value, or an immediate transparency of social relations under communism). This does not mean, however, that he resorts to either a celebration of or a resigned submission to capitalism. Just as *Nietzsche and Philosophy* calls for an affirmation of active forces over reactive forces, so the central imperative of *Anti-Oedipus* is to push further the deterritorialisations of capital, against its efforts to reterritorialise. It has been suggested that this argument aligns Deleuze with a Hayekian liberalism: if the state is that which reterritorialises the decoded flows of the market, then Deleuze's call to deterritorialise effectively becomes a call for the deregulation of the market against the restrictions of the state.[5] The reverse is true, however: it is precisely Deleuze's argument that distances him from Hayekian liberalism and makes a mockery of attempts to portray Deleuze as 'the ideologist of late capitalism' (to use Žižek's phrase) (Žižek 2004: 183). Following Marx, for Deleuze and Guattari the reterritorialisations of the state are not *opposed* to the deterritorialisations of the market, as a reactive limit on a boundless natural energy: the state is a necessary model of realisation for the axiomatic that capitalism requires. The call to push deterritorialisation further, far from being an exultation of the market, is in fact what provides Deleuze's analysis of capitalism with a critical perspective. It offers recognition that the deterritorialising tendencies of capitalism offer the potential to lead somewhere different and unexpected, and it demands that this deterritorialisation be pursued against capitalism's simultaneous tendency to reterritorialise in order to further and protect private accumulation. This position is inspired in part by Nietzsche, echoing the distinction between active and reactive forces in *Nietzsche and Philosophy*. But it is also a strictly Marxist position: like Marx, Deleuze recognises both the possibilities and the dangers immanent within capitalism.

In *Anti-Oedipus* we thus have the Marx that was promised in *Nietzsche and Philosophy*: a reconstructed, non-dialectical Marx who proposes a radical, immanent critique of the present in the name of something yet to come. This is not to say that the Marx of *Anti-Oedipus* had already been worked out by Deleuze in *Nietzsche and Philosophy* and needed only further elucidation or application. Rather, in the same way that Deleuze's collaborative work with Guattari develops concepts

that had already been created by Deleuze alone, so too does that work develop Deleuze's Marx. Something similar can be said of Deleuze's first great work of philosophy, *Difference and Repetition*.

III. Marx and Social Ideas

Like *Nietzsche and Philosophy*, *Difference and Repetition* is a fundamentally political text. *Nietzsche and Philosophy* sought to champion the creation of new values over the recognition of established values: *Difference and Repetition* maintains this critical distinction, and takes as its central target the dogmatic image of thought, whose contours had been sketched out in the Nietzsche book. The dogmatic image of thought operates through recognition, and in so doing ' "rediscovers" the State, rediscovers "the Church" and rediscovers all the current values that it subtly presented in the pure form of an eternally blessed unspecified eternal object' (Deleuze 2004b: 172). It is politically conservative, even reactionary, endorsing established values rather than promising new ones. Deleuze's critique of representation and the dogmatic image of thought in *Difference and Repetition* thus has political consequences: it aims to expose and undermine forms of thought that reinforce the status quo. But this is not a primarily epistemological or ontological critique that also happens to produce political effects: to a great extent it is motivated in the first place by political considerations. In the concluding chapter of the book, Deleuze states abruptly that 'if the truth be told, none of this would amount to much were it not for the moral presuppositions and practical implications of such a distortion' (Deleuze 2004b: 337). He is referring here specifically to the dialectic, in particular Hegel. But Hegelian dialectics is only the most pernicious form of orthodox thinking; the warning can be extended to give it wider significance and cover the distortions of the dogmatic image of thought in general: the critique of representation amounts to little if it does not combat the presuppositions and practical implications of those distortions. The presuppositions are not merely moral but profoundly political: it is presupposed that the established values of Church and State, the values that maintain the present political order, must be protected. If there is any doubt about the political significance of the 'practical implications' that Deleuze refers to, a few lines later he provides a pertinent example: it is the bourgeoisie that uses the weapon of contradiction to defend itself, while the (proletarian) revolution proceeds by the power of affirmation (Deleuze 2004b: 337). Deleuze's battle against the concepts of 'contradiction', 'opposition', 'analogy', and so on – his struggle to show that these categories, though

they may be indispensable, are only effects of a more fundamental difference – is therefore profoundly political. Thus while it is acceptable – even necessary – to question and challenge the political consequences of Deleuze's metaphysics (as Badiou [2000] does), it would be profoundly misguided to argue that Deleuze is merely apolitical (as Žižek does).

Where does Marx fit in this time? Deleuze's reference to the proletariat may once again suggest an ambiguous attitude: employing Marxian phraseology while simultaneously implicitly rejecting Marx's reliance on the concept of contradiction. Yet we have already seen that in Deleuze's work rejection of apparently fundamental Marxian tenets (like the notion of societal contradictions) is perfectly compatible with continued use of Marx. The broad arguments of *Difference and Repetition* can be seen to reflect the Deleuzian analysis of capitalism that has already been outlined: capitalism both generates and curbs difference, at once subverting what Deleuze calls 'the qualitative order of resemblances' (destroying all traditional representational codes) and reinforcing what he terms 'the quantitative order of equivalences' (reducing every relation to one of exchange) (Deleuze 2004b: 1).[6] More than this, it can be said that although there are not many more references to Marx in *Difference and Repetition* than in *Nietzsche and Philosophy*, Marx's presence is stronger in the second book: rather than allusive suggestions and unanswered questions there is a concrete use of Marx. His main appearance comes in the fourth chapter on 'Ideas and the Synthesis of Difference'. Deleuze posits that, following Marx, we can say that there are social Ideas. What this means is that we can think of society as a structure or multiplicity: a system of differential elements with no prior identity, determined by reciprocal relations and incarnated in actual relationships. In the case of capitalist society, and following Marx, we can say that virtual relations of production are incarnated in actual relationships between wage-labourers and capitalists. These relations – which are here class relations – are not characterised by some pre-existing identity but are reciprocally determined. In this way, it is possible to claim that the economic conditions of a society determine all other aspects of that society – not because actual economic relationships are the essence of society considered as a totality, but because those actual relationships, and all social relationships, are the incarnation of economic relations as differential virtualities that may be actualised in different ways. So we have something like the priority of the economic as found in Marx, without the economic essentialism as found in certain forms of Marxism.

Deleuze acknowledges that this reworking of Marx is not entirely original: Althusser and his collaborators had already read Marx in similar terms, and Deleuze quotes Althusser approvingly throughout *Difference and Repetition*. For Althusser, Marx's great theoretical contribution was to rethink the concepts of structure and structural causality (Althusser and Balibar 1970: 186): the Marxist conception of society is not a Whole in which the elements are expressions of an inner essence, but a complex and differentially articulated structure in which the elements are reciprocally determined. Deleuze's rereading of Marx thus looks very much like that of Althusser – yet Deleuze goes a step further. Althusser introduces the concept of 'overdetermination' in order to combat Hegelian Marxisms: instead of reducing the complexity of a society to a simple, central contradiction (as Althusser claims Hegel has done), overdetermination allows us to think society precisely as a structure in which differential elements are codetermined. But as Deleuze points out: 'It is still the case that for Althusser it is contradiction which is overdetermined and differential, and the totality ... remains legitimately grounded in a principal contradiction' (Deleuze 2004b: 87). Thus, for Deleuze, Althusser remains too tied to the dialectic (which, after all, is for Althusser the 'crucial gift' that Hegel gives to Marx [Althusser 1972: 174]). In addition, and relatedly, the Deleuzian language of virtuality allows us to avoid the risk of reintroducing a simple determinism such as comes with the Althusserian 'determination in the last instance by the economy': the movement from the virtual to the actual is creative and always leaves other potentials unactualised. So Deleuze's critique of certain forms of Marxism is thus also in part an escape from Althusserianism. Of course Althusser himself later sought to break away from Althusserianism: in particular, the turn towards 'aleatory materialism' in the 1980s can be characterised as an attempt to offer a more open philosophy that is less beholden to dialectical thinking and provides greater sensitivity to the contingent singularity of events. Yet this move by Althusser comes long after Deleuze's radical reading of Marx in *Difference and Repetition*. Indeed, while there were clearly numerous factors – both theoretical and political – that led Althusser to reformulate his philosophical approach, it is not fanciful to speculate that in doing so he may have been influenced by Deleuze: certainly he cites Deleuze positively in his later work (Althusser 2006: 189).

We have seen that Deleuze's Nietzschean Marx resurfaces in *Anti-Oedipus*; similarly, the presentation in *Difference and Repetition* of the Marxist conception of society is developed in *A Thousand Plateaus*. Rather than referring to social Ideas, in *A Thousand Plateaus* Deleuze

and Guattari refer to social machines. There are virtual abstract machines that can be actualised in a variety of social assemblages. Deleuze and Guattari refer to 'machinic assemblages': concrete assemblages effectuate or actualise abstract machines and '[a]bstract machines operate within concrete assemblages' (Deleuze and Guattari 1988: 510). There remains a common purpose, however, behind the two terminologies of social Ideas and social machines: namely, to theorise social forms without reference to any kind of organic totality or any transcendent imposition of unity. In one sense Deleuze and Guattari do this in conscious opposition to Marx: 'We define social formations by *machinic processes* and not by modes of production (these on the contrary depend on the processes)' (Deleuze and Guattari 1988: 435). But this reflects a transformation rather than a rejection of Marx. The concept of a social machine enables Deleuze and Guattari to rethink Marx's concept of a mode of production in various ways. A machine is made up of fluid connections: it selects, connects and combines different elements, interrupting and arranging flows – flows of people, of wealth, beliefs, desire, and so on. The Deleuzian 'machine' is therefore more dynamic than either simply the Marxian 'mode of production' or the Althusserian 'structure': a machine is a process rather than a static combination of determined elements. The terminology of machines also allows Deleuze and Guattari to overcome certain traditional binaries. It identifies different elements and levels of analysis without depending on a simplistic base–superstructure model whereby one needs to dive beneath the surface to find the hidden, determining instance, the inner essence that drives the whole. As Jean-Jacques Lecercle has said of the concept of assemblage (as actualised machine): 'It makes it possible to go beyond the separation between material infrastructure and ideal superstructure, by demonstrating the imbrication of the material and the ideal' (Lecercle 2006: 200). Deleuze himself claims: 'There is no base or superstructure in an assemblage' (Deleuze and Parnet 2002: 71). Related to this deconstruction of the relation between a supposedly material base and a supposedly ideal superstructure is the machine's imbrication of labour and desire: in a machine, there is no division between that which is objective, political and real and that which is subjective, libidinal and fantastic or ideological. This is, however, not a repudiation of Marx's concept of the mode of production but rather a development of it: an attempt to push Marx in an even more materialist direction.

Some commentators have argued that Deleuze and Guattari's theory of machinic assemblages distances them from the Marxist tradition. This argument has perhaps been best articulated by Manuel DeLanda.

DeLanda must be considered one of the foremost commentators upon Deleuze – better, in fact, simply to call him Deleuzian than a commentator upon Deleuze, precisely because the value of his work lies in the fact that he does not merely comment on Deleuze but attempts to reconstruct Deleuze's philosophy, not unlike the way in which Deleuze himself approaches other thinkers. But there is in DeLanda's work a curious blind spot when it comes to Marx, or rather a strange hostility. Although DeLanda's best work is a Deleuzian study of the philosophy of science (DeLanda 2002), he cannot be counted among those who obliterate Deleuze's politics by ignoring it, for elsewhere he has offered lucid and thoughtful accounts of the implications of Deleuze's work for social and political thought. Marx, however, is eliminated from these accounts: else occasionally explicitly condemned as the kind of anachronistic thinker Deleuze tried to escape from, but more often simply ignored. From Deleuze's work on abstract machines and social assemblages DeLanda develops what he calls 'assemblage theory', the value of which he claims is that it can account for entities without having to suppose either that there is an organic totality whose parts are seamlessly fused together or that the whole is nothing more than the aggregate of its parts. In contrast to these flawed approaches, assemblage theory is 'an approach in which every social entity is shown to emerge from the interactions among entities operating at a smaller scale' (DeLanda 2006: 118). This does not mean simply recognising that societies are made up of relations between individuals. The problem with existing theories, DeLanda argues, is that they treat scale as absolute – so that, for instance, individual persons are considered 'micro' while whole societies are 'macro'. In contrast, assemblage theory relativises scale: both individuals and societies have both micro- and macro-levels, depending on how you view them (DeLanda 2008: 166). Given this, to continue to talk of entities like 'society as a whole' or 'the capitalist system' is misguided or spurious, because it erases the very distinctions of scale that assemblage theory reveals: a society or the capitalist system are not wholes of which other entities are component parts, but can themselves be component parts (if considered in a global or even planetary context, for example).

In his discussions of assemblage theory DeLanda largely passes over Marx's work in silence, pausing only to accuse Marx (amongst others) of a 'macro-reductionism' within which only the social structure really exists, with individuals relegated to the status of epiphenomenonal effects of the social structure (DeLanda 2006: 5). If Deleuze and Guattari continue to talk of 'capitalism' then according to DeLanda this only

attests to the fact that 'the Marxist tradition was like their Oedipus the little territory they did not dare to challenge' (DeLanda 2008: 174). This is a problematic argument, in at least two (related) ways. First, Deleuze's dependence on Marx is far more than a residual terminological affiliation: as we have seen, in his own writings and those produced with Guattari, a critical engagement with Marx is an important part of the development of Deleuze's (and Guattari's) analyses of social forms. Second, Deleuze's work itself demonstrates that we do not need to read Marx as a theorist who prioritises the social structure at the expense of its components: any society is an actualisation of virtual relations, and thus a dynamic solution to the problem of how to order relations of production rather than a static structure that determines and fixes the relations within it. A major problem with DeLanda's presentation of 'assemblage theory' is his insistence on interpreting it in terms of scale. What Deleuze and Guattari call 'micropolitics' – that is, the central project of *A Thousand Plateaus* – has nothing to do with scale.[7] They are unequivocal on this point: 'the molar and the molecular are distinguished not by size, scale, or dimension but by the nature of the system of reference envisioned' (Deleuze and Guattari 1988: 217). Micropolitics therefore does not entail a rejection of a concept like 'capitalist society' for being too generalised or too large, unable to account for scale; it entails a different kind of analysis of capitalism. Micropolitics means analysing different kinds of line: molar lines of rigid segmentarity, molecular lines of supple segmentarity, and lines of flight (that which escapes and provides new connections and the possibility of change). A micropolitical analysis of capitalism is an analysis that recognises that capitalism is traversed by deterritorialising lines of flight – indeed that these lines of flight are its very conditions of operation: in order to function capitalism must necessarily release and encourage flows that may lead in unexpected directions which it cannot control (Deleuze 1997: 189). This insight is taken in large part from Marx's analysis of capitalism as a mode of production that must constantly revolutionise the instruments and relations of production – and that hence, in Deleuzian language, is always creating new flows and lines of flight. Far from being predicated upon a rejection of Marx, the micropolitics of social assemblages is deeply indebted to his work.

IV. Conclusions

Analysis of the place of Marx in Deleuze's early works achieves a number of things. First and foremost, it validates and reinforces

Deleuze's self-description as a Marxist. This aids understanding of his later work with Guattari. The point is not to attempt merely to reverse the orthodox view of the Deleuze–Guattari books, so that the Marxist politics therein becomes all Deleuze's, to the neglect of Guattari's contribution. Rather, by recognising that both Deleuze and Guattari were Marxists when they came to work with each other, we are better able to trace the lineage of their arguments and concepts: it is not only with reference to Deleuze's broader conceptual innovations that we can sketch a line between his early and his later, collaborative work, but also with reference to his specific use of Marx. In addition to throwing new light on the joint works, recognition of Deleuze's Marxism alters our understanding of his solo work, bringing out passages or insights that have been ignored. The image of Deleuze that arises from both *Nietzsche and Philosophy* and *Difference and Repetition* is not at all that of an apolitical elitist yet to show an interest in Marx, but of a politically committed thinker involved in contemporary debates within Marxism and making the first steps towards a reformulation of Marx's ideas, unafraid to deal with him even though he was still associated with trends that Deleuze must have found repellent and that many of Deleuze's contemporaries had abandoned Marx altogether.

There has in recent years been an effort by some commentators to align Deleuze with a liberal-democratic, even Rawlsian, politics.[8] This effort is not in itself illegitimate, and may even yield significant insights. Nor is it wholly incompatible with recognition of the important place of Marx in Deleuze's work. But there is a risk that if Deleuze is aligned with the liberal tradition in this way – even if as a critical interlocutor – then what makes his work interesting in the first place may be smoothed away, to the extent even that Deleuze may effectively become depoliticised: assimilated into mainstream thought and practice and into an academic exercise in the history of thought, his work loses his political impact. It might be argued that, on the contrary, to align Deleuze too closely with Marx is to depoliticise him. There has, after all, been a long-standing accusation made against Marx that he is depoliticising, in that he supposedly effects an economistic reduction or effacement of the political. But Deleuze and Guattari know that this is not true: what they show throughout both volumes of *Capitalism and Schizophrenia* is that far from reducing the political to the economic, Marx demonstrates that it is capitalism itself that performs this reduction, as it functions directly through an axiomatic, without the need for political codes or beliefs. Simultaneously, they show that Marx politicises realms that had been previously thought to be apolitical: it

is true that capitalism effaces politics by making political institutions, values, beliefs, practices, etc., secondary or even unnecessary – but this effacement of politics is itself a political manoeuvre: it is generated by economic forces that prior to Marx (in the work of the classical political economists) had been considered an apolitical realm of natural and spontaneous order, but which Marx reveals to be pervaded by political relations of power and domination. When they claim that it is Marx's analysis of the encounter between the deterritorialised worker and decoded money that lies at 'the heart of *Capital*' (Deleuze and Guattari 1977: 225), Deleuze and Guattari indicate the importance of Marx's section on primitive accumulation. They do this not simply because this section counters determinist readings of Marx and demonstrates his recognition of capitalism's contingent origins, but also because it is here above all that Marx politicises economics. For Marx as for Deleuze and Guattari, the recognition that the capitalist economy depoliticises must be based upon the simultaneous recognition that the capitalist economy is highly politicised.

Furthermore, all this rests upon a politicisation of philosophy. Marx directs philosophy's attention to the political struggles and forces that exist as an integral part of apparently apolitical domains, including that of philosophy itself: philosophy's function after Marx is no longer to separate the true from the false but to analyse, interrogate and change the material conditions of its own emergence, challenging the existing order in the name of a new world. Deleuze's *Nietzsche and Philosophy* and *Difference and Repetition*, far from being apolitical, are in a similar way politically motivated by the need to challenge established values and create a new order. To recognise this is to begin to recognise Deleuze's debt to Marx. A political Deleuze and a politicised Deleuzian philosophy are both possible and welcome – but we will get nowhere until we acknowledge the profundity and persistence of Deleuze's Marxism.

Notes

1. See in particular the excellent studies found in Lecercle (2005), Read (2003) and Thoburn (2003).
2. I think that one way (among others) to distinguish between the well-known critiques of Deleuze by Badiou (2000) and Hallward (2006) is to say that whereas the former rejects the political implications of Deleuze's work, the latter denies that Deleuze's work has any real political relevance at all.
3. It is not my aim to offer a thorough critique of all of Žižek's arguments concerning Deleuze (which are more interesting and sophisticated than many Deleuzians have acknowledged): I am interested only in Žižek's claim that Deleuze is neither political nor Marxist.

4. This point is well made by Paul Patton (2000: 132).
5. It should be said that the links between Deleuze and Hayek are more often alluded to than actually worked out: see Garo (2008a: 612) and Mengue (2003: 67).
6. Eugene Holland opens his informative account of the relation between Marx and Deleuze (and Guattari) in this way, arguing that the 'first page of Deleuze's most important philosophical work, *Difference and Repetition*, lays the groundwork for his analysis of capitalism' (Holland 2009: 147).
7. For further criticism of this sort, see the review of DeLanda's *A New Philosophy of Society* by Read (2008).
8. Patton is perhaps the leading figure here; see Patton (2005, 2007, 2008). See also Tampio (2009) and the review of Patton's *Deleuze and the Political* by Smith (2003).

The Marx of *Anti-Oedipus*

Aidan Tynan Cardiff University

Abstract

The meeting of Deleuze and Guattari in 1969 is generally used to explain how the former's thought became politicised under the influence of the latter. This narrative, however useful it might be in explaining Deleuze's move away from the domain of academic philosophy following the upheavals of May 1968, has had the effect of de-emphasising the conceptual development which occurred between *Difference and Repetition* and *Anti-Oedipus*. Worst of all, it has had the effect of reducing the role of Marx's philosophy to the superficial level of political alibi, impoverishing our understanding of its importance with respect to the conceptual assemblage of *Anti-Oedipus*. This paper attempts to restore Marx's relevance to Deleuze and Guattari's project by understanding *Anti-Oedipus* through the Marxian categories of production, distribution, surplus-value and consumption, and argues for a conception of schizoanalysis which does not relegate the name of Marx to the garbage heap of poststructuralist intellectual strategy.

Keywords: Marx, *Anti-Oedipus*, capital, production, surplus, distribution, consumption, ideology

The story of the meeting of Deleuze and Guattari in the summer of '69 has attained something of a mythological status. The reason for this is clear: *Anti-Oedipus* is one of the most important and controversial intellectual responses to the political tumult of May '68. The accepted version of the 'origin myth' suggests that Deleuze, the respectable professor, needed the sense of political urgency which Guattari offered, while Guattari, the lifelong activist, needed the theoretical grounding which Deleuze provided (Holland 1999: vii). While this characterisation is based on the authors' own statements, and is obviously in some respects accurate, it has led to a certain picture, most luridly painted in recent times by Slavoj Žižek, of the radicalism of *Anti-Oedipus* as a purely strategic interjection whereby, in the climate of political

reaction which followed May '68, Deleuze cynically acquired a political alibi (Žižek 2004: 20–1). Such a strategic explanation of Deleuze and Guattari's joint enterprise, moreover, has been used by Deleuzians partly as a way of explaining the change in tone between *Difference and Repetition* and *The Logic of Sense* on the one hand, and *Anti-Oedipus* on the other, and partly as a means to perceive Deleuze and Guattari's relationship to Marxist theory as extrinsic.[1]

While the strategic explanation is no doubt a useful shorthand in accounting for Deleuze and Guattari's fulminating style, it tends to impoverish our understanding, emphasising a paradigm shift in Deleuze's thought at the cost of a sense of logical development and continuity. What's more, Deleuze's apparent shift from the history of philosophy to political theory has been interpreted by some critics as little more than a superficial retooling of an ultimately apolitical philosophy of difference.[2] What I wish to argue here is that the transition from *Difference and Repetition* to *Anti-Oedipus* represents neither a dramatic change of terrain nor a post-conceptual politicisation. We should instead regard *Anti-Oedipus* as the necessary and logical development of concepts already active in Deleuze's thought prior to his meeting with Guattari.[3]

In *Difference and Repetition*, Deleuze writes that 'the name of Marx' is enough to save his philosophy of difference, and particularly his rejection of Hegel, from being merely 'the discourse of beautiful souls' (Deleuze 1994: 207). What are we to make of this, especially when Marx appears only in passing in the pages of *Difference and Repetition* and only once, briefly, in *Logic of Sense*? I wish not only to argue that the critique of the philosophy of difference which Deleuze performs in these books is logically consistent with the Marxian theory of desiring-production presented in *Anti-Oedipus* but that this logical consistency needs to be grasped in order to understand fully the Marxism of the latter book. In the place of Hegel's concepts of contradiction, opposition and alienation, Deleuze puts his processual theory of different/ciation which in *Anti-Oedipus* is termed desiring-production. The concept of a surface upon which actualisation and counter-actualisation take place, and the objective illusion which attends this process, functions in *Anti-Oedipus* to account for the historical development of capital, the ideological 'image' of the real relations of production, the law of the tendency to a falling rate of profit and the displacement of capital's immanent limit which secures the counteraction of this tendency. In short, the philosophy of difference and repetition, of actualisation and counter-actualisation, of surface and

depth, are given an explicitly Marxian expression in the pages of *Anti-Oedipus* and this in no way entails a crude *politicisation* of Deleuze's thought. The commitment to Marx which *Anti-Oedipus* displays is at least as much a theoretical as a strategic commitment.

I. Productive Dissymmetry

In *Anti-Oedipus*, Deleuze and Guattari use Marx's concepts to give an account of the *immanentisation* of capital, the means by which capital's interior limits become its principle of expansion. If a reconstruction of this account in Marx's own terms is rarely done, this is due to the conviction that Marx is largely external to Deleuze's thought. But such a reconstruction is vital in dispelling the pervasive misunderstanding that the theory of desire put forth in *Anti-Oedipus* is complicit with the postmodern stage of capital.[4] If Marx's chief contribution was to disengage capital from its concrete manifestations in order to perceive its laws, then desire, like capital, must be understood not in any sense as a 'thing' but as a process which goes through different phases in order to reproduce itself. If Deleuze and Guattari emphasise desiring-production, rather than a desiring subject or a desired object, it is because they want us to grasp this processual aspect as primary.

Marx's critique showed how bourgeois political economy begins at the level of exchange, distribution or consumption, whereas these are always secondary with respect to production. If political economy tends to uphold and justify capitalist exploitation, Marx argued, it is because it begins with the phenomenal or ideological form of capital as 'concrete' rather than with production as the 'rational abstraction' capable of explaining how the concrete became what it is (Marx 1973: 100–1). Similarly, as Deleuze and Guattari argue, psychoanalysis, beginning as it does with a concept of desire already installed in the subject–object form (desire as sexuality), tends to naturalise the repressive social structure constitutive of this form. Desiring-production, then, is Deleuze and Guattari's rational abstraction and the desiring-machine the form of desire's autoproduction.[5]

For Marx, the economic categories of exchange, distribution and consumption must be considered moments of the process of production even when these categories appear to exert a determining influence on that process. We might suppose for example that need is primary with regard to the products which satisfy it. Anyone with any experience of consumer culture, however, will quickly deny this, as the market clearly creates the 'needs' for whatever objects it believes consumers

will be willing to purchase. This essentially cynical, consumerist insight corresponds to the economic principle of Say's law which states that the supply of goods in the market creates the demand for them. At first glance, this appears to be in accord with Marx's emphasis on the determining role of production. The production of ever more consumer goods appears necessary for the capitalist system to maintain stability and fend off crises caused by wars, shortages of raw materials and so on. All that is required for the market to regain stability is to create more commodities and stimulate more demand. Hence, although we might admit the primacy of production in the creation of commodities, it is consumption which has the true determining influence since it is the latter which governs the reproductive process. To assert the priority of production in the midst of mass consumerism and artificial needs might then seem hopelessly naïve.[6]

Marx was quite vociferous in his condemnation of Say's law and its adherents (Marx 1973: 94; Harvey 1982: 76). The reason for this is simple: to say that supply creates its own demand – in other words that, given the right conditions, they cancel one another out – is to suppose that the market is essentially equilibrating and that disequilibrium always has some external source. Marx, however, argued that the crises which afflict capital are generated by capital itself, and this for the simple reason that capitalist production is founded on the unequal, antagonistic relationship between the worker, who owns nothing but his labour-power, and the capitalist, who owns the means of production. This fundamental inequality is what allows the capitalist to extort surplus-value and 'realise' it as profit through a system based on the general equivalent of money (the market). Exchange, distribution and consumption explain nothing in themselves because there is a necessary *disjunction* between the worker as producer and the worker as consumer (Hardt and Negri 2000: 222). In order to furnish the capitalist with profit, the worker must produce *more* than he consumes. The laws of equivalence which condition the wage-system (an honest day's work for an honest day's pay) and the market (you get what you pay for) are derived and secondary with respect to this 'productive dissymmetry' (Deleuze 1994: 20).

This last point is key to understanding the theory of desire put forth in *Anti-Oedipus*. For desire to produce, it requires machines (a form of autoproduction) and, to the extent that this link is the fundamental connective principle which governs all life, *every* machine is a desiring-machine. But this does *not* mean that every machine functions according to the same laws, or uses, by which it has been produced (Deleuze and

Guattari 2004: 314–16).[7] The primary and direct link between desire and the machine should not lead us to believe that every desiring-machine is equally legitimate, or that production and machine are cognate terms. It is quite possible, for example, to desire fascism, but this does not mean that desire is essentially fascistic. Similarly, we are not revolutionaries simply because we desire.

To say that a society consumes as much as it produces is to say ultimately that it produces only in order to consume. But Marx's claim is that capital's ultimate goal is to reproduce itself in ever greater magnitudes and to displace the limits, internal to it, which reproduction imposes. This, as many have pointed out, is the only way of accounting for the global dominance capitalism has attained. It is only on the 'surface' of capitalist society, that is, in ideological phenomena and the movements of the market, that production and consumption appear to cancel one another out. This illusion is maintained by commodity fetishism. In the first volume of *Capital* Marx examines this phenomenon closely. The 'free' worker, owning nothing but his labour-power, stands in an unequal relation to the capitalist – the relationship between worker and capitalist is only productive to the extent that it is unequal and relative.[8] The capitalist can exchange the commodity thus produced for the equivalent of its value. Hence, Marx speaks of two entirely different forms of value: 'the relative form and the equivalent form are two intimately connected, mutually dependent and inseparable elements of the expression of value; but, at the same time, are mutually exclusive, antagonistic extremes – *i.e.* poles of the same expression' (Marx 1954: 55). In Marx's expressive theory of value a commodity (a roll of linen or a coat) can be said to express x amount of another commodity. A coat can be expressed in x rolls of linen, a roll of linen in x number of coats, and so on. But changes in the conditions of production (increasing exploitation, technological development, etc.) cause this equation to fluctuate continually. Hence the disjunction between value, measured by production, and exchange value, measured by money. What this means is that value exists only in its expression as production and cannot be said to pre-exist it.

We might be tempted here to object that labour-power is the form value takes prior to its realisation in commodities, however, Marx insists that labour-power is not value but what *creates* value (Marx 1954: 57). Productive capacity is the source of all value but is not itself a value. If the commodity fetish has a mystifying function, it is that it gives an equivalent expression to an unequal relationship. In this sense, the distinction between production and capital *appears* quantitative and

calculable: the worker exchanges an amount of his labour for a set wage, the more he works, the more he earns. But underlying this is a qualitative distinction between labour-power as value-creating activity and the general equivalent through which value is expressed. The difference between production and capital is both quantitative *and* qualitative, which is what allows labour to be turned into a commodity and sold, and why Marx continually speaks in both *equivalent/absolute* and *relative* terms.

Marx's solution to the problem of the genesis of value was only possible by separating human labour-power in the abstract from its embodiment in both commodities and concrete forms of labour. The concept of simple abstract labour was derived by Marx from Smith and Ricardo, who posited the existence of a form of wealth on the side of the subject, prior to its embodiment in objects (Deleuze and Guattari 2004: 280–1). The 'liberation' of labour-power from traditional social forms means that, unlike the serf, the slave or the bondsman, the free worker has to sell his labour-power in order to become a 'factor' of production. As a consequence of this, the worker himself is produced as an adjacent part, peripheral to the production process which his labour constitutes in concert with the means of production. This is what Marx means when he says the worker is literally 'devalued' by capital. But how was the free worker separated from the means of production in the first place and how is he continued to be separated from them? This brings us to the problem of 'primitive accumulation' and the disjunctive synthesis.[9]

II. Separation, Distribution and Disjunction

Deleuze's jettisoning of Hegelian categories appears to place his philosophy in a compromised position with respect to the 'bloody contradictions' out of which history is inevitably made. If difference is not given in terms of contradiction then the difference which Deleuze emphasises might seem to be somehow indifferent to materiality, austere and otherworldly. Supposing, as is generally done, that the inequality between production and capital is made known only through contradiction and opposition, does this not put Deleuze in league with the mystifications of capital itself? As Marx points out, the specific illusion to be dispelled is that capital rather than labour is productive: '[Capital] becomes a very mystic being since all of labour's social productive forces appear to be due to capital, rather than labour as such, and seem to issue from the womb of capital itself', while the market becomes 'an enchanted, perverted, topsy-turvy world, in which Monsieur le Capital and Madam la Terre do their ghost-walking' (Marx 1972: 827–30).

In *Anti-Oedipus*, Deleuze and Guattari stress that desire composes the material infrastructure as much as the cultural and ideological superstructure. In other words, desire is immediately constitutive of reality. If this is so, how can we account for a specifically political domain defined by desire, the transition from formal to real subsumption in the labour process, the increasing dominance of technical machines in social reproduction, and most importantly the mystification of the relations of production in social life?[10] This relates to a larger debate within Marxism relating to the problem of political consciousness and the opposition of theory and practice. Marx invokes historical examples (chiefly the British land enclosures of the seventeenth and eighteenth centuries) to explain the origins of 'primitive accumulation', the process by which the worker was separated from the means of production in order to render him 'free', the bearer of labour in its abstract form (Marx 1954: 669–70). But Marx de-emphasises historical subjectivity in order to lay bare the very laws of capital, which do not appear directly in experience and over which no one has direct control. This ambiguity in Marx's thought concerning the merits of history and practice on the one hand and theory on the other has led to much intramural debate (as, for example, between E. P. Thompson and Perry Anderson in the 1970s). But for Deleuze and Guattari, primitive accumulation is neither solely historical (materialist) nor continuous (ideological), and, while they dispense with ideology as crude false consciousness, they do in fact give a very powerful account of the mystification of desire, its 'capture' in social reproduction.[11]

In *Difference and Repetition*, Deleuze states that 'every phenomenon refers to an inequality by which it is conditioned' (Deleuze 1994: 222). We can take this as one of the essential statements of Deleuze's critique of the philosophy of difference. If empirical phenomena can be constituted as a set of differential relations between terms (Peter is taller than Paul, Paul is taller than John) then this has given rise to philosophies of difference (Aristotle, Leibniz and Hegel are Deleuze's main examples) which emphasise negation over positive terms and derive difference from identity. Deleuze's critique, however, not only charges that the primacy given to negation and identity stems from an illusion, but, and this is the crucial point, that the illusion is internal to difference itself (Deleuze 1994: 240). Difference generates its own illusory appearance – it generates, through its embodiment in concrete particulars, its own 'inverted image' or self-negation precisely because through its distribution in these particulars it is 'cancelled' in them. The concepts of opposition and contradiction are not the causes but only the effects of cancellation. The phenomenal world is 'doubled' by an

intensive, noumenal one, but this double is *asymmetrical* with respect to the extensive particulars whose production it conditions.

We might suppose from this that Deleuze's philosophy is crudely dualistic (as some readings tend to argue[12]) but the dissymmetry pertaining between intensive and extensive is reducible to neither domain. To do justice to Deleuze's philosophy, then, we must speak of three distinct elements: 1) a field of pure differentiation/intensity which qualifies the phenomenal field; 2) the phenomenal, differenciated field itself, where the laws of quantitative and qualitative determinations (contradiction, opposition, etc.) come into being and intensity is cancelled; 3) something which allows a communication, interaction and reciprocal determination between the two but is reducible to neither one. In other words, between intensity and extensity there is the all important factor of distribution. Distribution here plays for Deleuze the role of what, for other philosophers, would be epistemology. We can only *know* difference in its cancellation in empirical things but, and precisely because of this fact, we can *think* difference as that which conditions phenomena. Similarly, the distribution of difference in phenomena causes the empirical to be mistaken for what conditions it. The cancellation of difference in phenomena '[measures] the time of an equalisation', and in this way 'the principle of physical causality finds... its categorical physical determination' (Deleuze 1994: 223). The cancellation of difference appears at one with irreversible physical causality, so that we take the cancellation of difference for difference itself.

If the cancellation of difference in the empirical experience of quantity and quality takes on the character of irreversible physical causality (an 'apparent objective movement' as Deleuze and Guattari call it), then intensity allows us to grasp this movement from the perspective of difference in itself: 'intensity defines an *objective sense* for a series of irreversible states which pass, like an "arrow of time", from more to less differenciated, from a productive to a reduced difference, and ultimately to a cancelled difference' (Deleuze 1994: 223, emphasis mine). The apparent objective movement by which the producer is steadily impoverished through 'distribution' of the product has an 'objective sense' defined by the intensive states which qualify this distribution. If we are to find a concept of ideology in Deleuze, we should seek it here in the concepts of sense and distribution:

> Good sense is the partial truth in so far as this is joined to the feeling of the absolute.... But how is the feeling of the absolute attached to the partial truth? Good sense essentially distributes or repartitions: 'on the one hand' and

> 'on the other hand' are the characteristic formulae of its false profundity or platitude.... Good sense is the ideology of the middle classes who recognise themselves in equality as an abstract product.... [F]or example, the good sense of eighteenth century political economy which saw in the commercial classes the natural compensation for extremes, and in the prosperity of commerce the mechanical process of the equalisation of portions. (Deleuze 1994: 224–5)

The distribution which good sense effects repartitions (separates) and equalises in a compensatory manner according to the logic of the part and the whole, the part which belongs to the whole and the whole which lacks the part. In opposition to this, however,

> there is a completely other distribution which must be called nomadic, a nomad *nomos*, without property, enclosure or measure. Here, there is no longer a division of that which is distributed but rather a division among those who distribute *themselves* in an open space – a space which is unlimited, or at least without precise limits. Nothing pertains or belongs to any person, but all persons are arrayed here and there in such a manner as to cover the largest possible space. (Deleuze 1994: 36)

The discourse of *Anti-Oedipus* is organised around these two distinct forms of distribution. The molar corresponds to 'mass phenomena' and 'the laws of large numbers' while the molecular is described as 'micropsychic' and 'micrological' (Deleuze and Guattari 2004: 311–16). What needs to be remembered is that these are types of *distribution* and not differences in scale. We must avoid at all costs interpreting Deleuze and Guattari's position here as a sort of 'cult of the small'. The crux of the matter is that, while *all* production corresponds to molecular laws, which are schematised as the three syntheses of desire, when it comes to reproduction these syntheses can become subject to 'illegitimate uses' corresponding to the molar distribution. This is how Deleuze and Guattari account for the 'apparent objective movement' which allows 'a fetishistic, perverted, bewitched world' to come into being as a requirement of 'social reproduction' (Deleuze and Guattari: 2004: 12). We must also note that this process through which the real source of production (labour) is mistaken for something dependent on it (capital, the earth, the despot) is, for Deleuze and Guattari, a characteristic of *all* societies to the extent that all societies reproduce themselves. Desire, then, in its revolutionary mode, produces without reproducing, and so is antithetical to *any* kind of social organisation, whatever its character.

Anti-Oedipus is concerned with understanding the role of capital with respect to this tension between production and reproduction, and specifically how capital, unlike other modes of production, draws on desire directly in order to secure its reproduction. Capital releases a form of desire, described by psychoanalysis as libido, freed from any social or organic ties, an eminently flexible form of energy which can be channelled into any imaginable activity. This is how we should account for the bizarre array of desiring-machines in the opening passages of *Anti-Oedipus*. But 'free' desire, like 'free' labour, is something of a misnomer: in order to function, it needs some kind of 'surface' on which its effects are registered, recorded, stored-up, that is, distributed. This is why Deleuze and Guattari need the concept of the body without organs. The latter is what orchestrates desire, it is a surface on which the desiring-machines can become productive. Capital, then, forms the body without organs of capitalist society. But what really interests Deleuze and Guattari is the discovery of different kinds of bodies without organs in the pathological states of schizophrenia, in which the functioning and distribution of the machines follow the laws of production, not the laws of the reproduction of capital. While these pathological states are in no way desirable in themselves, they provide a heuristic for the revolutionary imagination.

If a society which reproduces in the same way it produces is literally impossible according to the criteria of the syntheses of desire this is suggested by the fact that, at the heart of desire, there is an antiproductive element which tends to resist the desiring-machines. The body without organs emerges not only as something which allows the machines to operate but also as a means to resist them (Deleuze and Guattari 2004: 9). Every investment of desire in an organ or a machine is a source of pain and anxiety, much in the same way that the investment of money in a large piece of constant capital, such as a manufacturing plant, is a cause of great concern for the capitalist. An organ, like a factory, is not in itself productive but only becomes so through investments of desire. This is why the body without organs forms a disjunctive surface which attracts the desiring-machines but also repulses them. Without this attraction–repulsion, no machine would ever work: 'The genesis of the machine lies precisely here: in the opposition of the process of production of the desiring-machines and the nonproductive stasis of the body without organs' (Deleuze and Guattari 2004: 10). It is only by being constituted in opposition to *any* sort of organisation of desire, social or organic, that the body without organs is capable, in a seeming paradox, of performing a regulating or distributive role with respect to the machines.

When the machines and the body without organs become opposed in this way (a functional opposition) the latter

> falls back on *(se rabat sur)* desiring-production, attracts it, and appropriates it for its own. The organ-machines now cling to the body without organs . . . An attraction-machine now takes the place, or may take the place, of a repulsion-machine . . . The body without organs, the unproductive, the unconsumable, serves as a surface for the recording of the entire process of production of desire, so that desiring-machines seem to emanate from it in the apparent objective movement that establishes a relationship between the machines and the body without organs. (Deleuze and Guattari 2004: 12)

This whole process, in which the desiring-machines are attracted and repelled, explains the phenomenon of primitive accumulation, the separation of desire from its productive organs, and the transition to the properly 'ideological' stage when desire labours under the repression which both keeps it apart from its final satisfaction and constantly stimulates it into new investments and counter-investments. Capital, and the relations between money and commodities that it establishes in its opposition to production, draws on desire directly in order to meet the needs of capitalist reproduction. If Deleuze and Guattari condemn the discourse of Freud it is because psychoanalysis never (with rare exceptions such as Wilhelm Reich) points up this complicity. In the Oedipus complex, the molecular (or pre-personal) way in which desire is produced (the id) is related to the molar (or personal) object forms: the father and the mother. By insisting on this molar distribution in the processes of psychic repression which constitute Oedipal sexuality, psychoanalysis argues that the desiring subject is produced as a function of these objects, as what is missing to and what is lacking them, whence the triangle of 'daddy-mummy-me'. The paternal law separates the child from the body of the mother, through its prohibition, then grants access under certain conditions (the molar distribution) which re-constitute desire as a function of the law. Whence the topsy-turvy, perverted and bewitched world.

It is vital to note here that desire is never duped into its complicity with authority, it simply continues to desire under conditions alien to its laws of production. Desire cannot be deceived because it is immediately constitutive and so has nothing to be deceived about. But this does not rule out something which performs the ideological function of 'capturing' desire. This is why Deleuze and Guattari insist that 'the essential thing is the establishment of an enchanted recording or inscribing surface that arrogates to itself all the productive forces and all the organs

of production, and that acts as a quasi cause by communicating the apparent movement (the fetish) to them' (Deleuze and Guattari 2004: 13). The body without organs, then, plays the role of an ideological surface, what Marx calls the 'surface of society'. The laws which determine the production of desire are not the same as the laws which determine the distribution of desire on this surface: 'when the productive *connections* pass from machines to the body without organs (as from labor to capital), it would seem that they then come under another law that expresses a *distribution* in relation to the nonproductive element as a "natural or divine presupposition" (the disjunctions of capital)' (Deleuze and Guattari 2004: 13). The 'real' cause refers to the 'inter-molecular modifications' of the desiring-machines, while the distribution of the machines on the surface presents a 'fictive' quasi-cause whereby the real cause is displaced in the apparent movement of separation/disjunction (Deleuze 2004: 108–9). This 'double causality' is the only thing capable of constituting the social world of desire and its capture. It is in the space opened by the two causalities that we find the domain of sense, the distribution and inscription of effects, or the ideological domain as such.[13]

Primitive accumulation, in which production is shorn from its products, is never accomplished once and for all but persists as a necessary part of the process; it is a necessary double movement which at once transforms the social means of production into capital and the producers into wage-labourers. The historical development of capital is dependent on this double movement which brings into being a disjunction between abstract 'production in general' shorn from the means of production, but also a *conjunction*, in which the two meet again but this time under conditions set by the capital relation. Once formulated in this way, we can understand Deleuze and Guattari's conception of the dynamic of accumulation constitutive of the specific power of the capitalist axiomatic as a disciplinary force.

III. Surplus-Value of Code, Surplus-Value of Flux

In chapter four of *Theories of Surplus-Value*, Marx writes:

> Productive labour, in its meaning for capitalist production, is wage-labour which, exchanged against the variable part of capital (the part of the capital that is spent on wages), reproduces not only this part of the capital (or the value of its own labour-power), but in addition produces surplus-value for the capitalist. It is only thereby that commodity or money is transformed into capital, is produced as capital. Only that wage-labour is productive which produces capital. (This is the same as saying that it reproduces on an enlarged

> scale the sum of value expended on it, or that it gives in return more labour than it receives in the form of wages. Consequently, only that labour-power is productive which produces a value greater than its own.) (www.marxists.org/archive/marx/works/1863/theories-surplus-value/ch04.htm)

Capital, in order to reproduce, must reproduce at an expanded rate because it only produces to the extent that it produces a surplus. Conversely, the way the worker produces is not the same as how he reproduces, or consumes in order to reproduce his labour-power, because the disjunctive surface of capital *excludes* the greater part of his product. Here we have the fundamental Marxist proposition regarding surplus-value, prior to its breakdown into profit, interest, rent, costs of circulation and so on. Under capitalism, products are not produced for their immediate use-value, they are kept in a reserve in order to be sold at a later date. For this reason, Marx saw clearly that the sphere of exchange, of *values*, is constituted as a function of a superabundance on the side of products, which itself presupposes the appropriation of labour above and beyond that required for the production of immediate use-values (Marx 1973: 456–9). Although Marx insists that surplus-value is unique to the capitalist mode of production, he does suggest that a form of accumulation in the capitalist manner is a naturally occurring and universal phenomenon:

> No production [is] possible without an instrument of production, even if this instrument is only the hand. No production without stored-up, past labour, even if it is only the facility gathered together and concentrated in the hand of the savage by repeated practice. Capital is, among other things, also an instrument of production, also objectified, past labour. Therefore capital is a general, eternal relation of nature. (Marx 1973: 86)

What Deleuze and Guattari call 'surplus value of code' is the means by which primitive economies regulate society through direct inscriptions ('scarifications') on the body which block any movement towards decoding. The emergence of capital, on the contrary, marks the transition to a society regulated by a surplus-value of flux, the latter being a 'conjunction' of two kinds of decoded flows: a flow of workers without any ties and a form of general equivalent capable of buying and selling anything at all, including labour-power (Deleuze and Guattari 2004: 290). The regulative principle of capitalist society, then, corresponds not to coding but to this interior limit between the mutually exclusive decoded/ing flows. This limit is regulative precisely because it both attracts and repels the organs of capital.

Capital is constantly deterritorialising, finding new, exotic markets and innovative practices of decoding at its periphery, but as part of the same movement it must reterritorialise, rediscovering within its centre zones of archaism and lack which check this expansion. Without subjects ready and willing to occupy, to *live*, this interior limit, capitalism itself would not be possible since it would be unable to legitimate its periods of crisis. Capitalism, then, must constitute a subjectivity based on hostility towards codes, but it must also produce subjects *unwilling* to follow decoding all the way beyond the social relations which condition the production of the decoded flows themselves. The psychoanalytic subject discovers 'desire in the abstract', a free floating desire (libido) which, however, is only free to the extent that it is tied to a social order that denies it satisfaction (prohibition of incest). Capitalist society constitutes the limit between production in general (desire) and production for the sake of capital (work) as its own interior, uncrossable limit (Deleuze and Guattari 2004: 333). The libidinal objects of the parental fantasy are 'discovered' only to the extent that they are rediscovered *outside* the family as symbolic substitutes (the cop, the priest, the nation). Deleuze and Guattari characterise the disciplinary power of capital entirely within the terms of this 'double movement', or axiomatic, the conjunction/disjunction of the two mutually exclusive flows:

> In *Das Capital* Marx analyzes the true reason for the double movement: on the one hand, capitalism can proceed only by continually developing the subjective essence of abstract wealth or production for the sake of production, that is, 'production as an end in itself, the absolute development of the social productivity of labor'; but on the other hand and at the same time, it can do so only in the framework of its own limited purpose, as a determinate mode of production, 'production of capital,' 'the self-expansion of existing capital.' Under the first aspect capitalism is continually surpassing its own limits, always deterritorializing further, 'displaying a cosmopolitan, universal energy which overthrows every restriction and bond'; but under the second, strictly complementary, aspect, capitalism is continually confronting limits and barriers that are interior and immanent to itself, and that, precisely because they are immanent, let themselves be overcome only provided they are reproduced on a wider scale (always more reterritorialization – local, world-wide, planetary). (Deleuze and Guattari 2004: 281)

The necessarily expanded reproduction of capital cannot be separated from a form of subjectivity which seeks to surpass its immanent limits (the unconscious) only by displacing them, redrawing them at a further remove – hence the psychoanalytic drama of Oedipus, in which the

subject overcomes the familial figures only by rediscovering them in the social and political domains.

The Marxian theory of money, then, is of particular interest to Deleuze and Guattari because it relates specifically to the production of 'axiomatised subjects' (Thoburn 2003: 97). The two decoded flows, the flow of workers and the flow of money capable of buying their labour-power are characterised as a differential (a difference between two differences). Money as a result appears in two forms, a flow of wages which goes into the pockets of the workers (what Marx called variable capital), and a flow of profits which the capitalist takes and reinvests in the means of production in order to extract more surplus-value from his workers (what Marx called constant capital). In establishing a common measure money effects the cancellation of the intensive difference, which qualifies the two flows:

> Let us return to the dualism of money, to the two boards, the two inscriptions, the one going into the account of the wage earner, the other into the balance sheet of the enterprise. Measuring the two orders of magnitude in terms of the same analytical unit is a pure fiction, a cosmic swindle, as if one were to measure intergalactic or intra-atomic distances in meters and centimeters. There is no common measure between the value of the enterprises and that of the labor capacity of wage earners. (Deleuze and Guattari 2004: 250)

Capital is not defined by a homogeneous flow, but by two mutually exclusive flows which act as checks on one another: a flow of payment and a flow of financing, a flow of tangible assets and a flow of credit, a market flow and a flow of technological innovation (Deleuze and Guattari 2004: 407). For this reason, Marx's theory of money is conceived on the one hand as a measure, or store, of value, and on the other as a medium of exchange, facilitating the circulation of capital (Harvey 1982: 251). The great 'cosmic swindle' which the social authority of capital performs is to conflate these two aspects of money, to displace the limit which separates them, and to mystify this in commodity-fetishism and exchange (Marx 1970: 87–9).

Deleuze and Guattari are insistent on a Marxian theory of money which gives adequate importance not only to the general equivalent but 'to banking practice, to financial operations, and to the specific circulation of credit money' since it is in the opposition of the two kinds of money (payment and finance) that difference is cancelled and surplus-value realised (Deleuze and Guattari 2004: 250). This explains why they are hostile to Freud's account which emphasises the role of the general equivalent in psychic life. According to Freud, the libidinal structure

which accounts for the significance of money is primarily anal-erotic rather than phallic. Hence, the famous equation 'money = shit' which Deleuze and Guattari so vehemently deride (Deleuze and Guattari 2004: 31). The phallus, being the standard or the unit of measure (gold), refers to *excrement* as the medium of exchange value, the general equivalent (credit-money). As Jean-Joseph Goux writes:

> Supplementary (superfluous) elements are what govern the circulation of substitutes. The surplus is *excluded* to act as measure of the replacements. In general, whatever the register, the universal exchange value is linked to excess. In the election of gold as in that of the phallus, the surplus is charged with measuring the deficit in transactions involving value – whether in a positive form (as surplus of wealth in gold or surplus of vitality in the phallus) or in a negative, archaic form (as excrement, matter that is excluded and expelled). (Goux 1990: 31, my emphasis)

Surplus brings into being a lack or exclusion (something withheld in a reserve) which functions as a principle of calculation (or cancellation)[14] and allows a separate flow to be set up as the medium of exchange. A 'detatched complete object' is excluded or excepted, only to return as the totality which the parts lack; the parts lack what is in excess of them.

The function of the State is to establish an infinite debt capable of appropriating and absorbing everything and this, precisely, is what establishes money as the general equivalent (Deleuze and Guattari 2004: 214–15). The despotic or Asiatic formation does not eradicate the primitive codes and their finite debts; it overcodes them by relating them all to a single, transcendent 'higher unity', rather than each other. The despotic mode of production brings into being two flows, a flow of credit (debt) and a flow of payment (tribute), crucial to the development of capital. In this sense, capitalism does not replace feudalism. Rather, feudalism becomes capitalism by being monarchised, democratised, etc., over a long historical period (Deleuze and Guattari 2004: 242). Capitalism lacks a 'body' of its own on which it could inscribe its codes precisely because it is hostile to coding and this is why it finds an archaic body on which to reterritorialise. Capitalism does not replace feudalism, but rather maintains elements of feudal authority, exercised no longer from a point of transcendence but immanently, through capital itself.

The limit between attraction and repulsion is the regulatory principle of all desire. This limit is universal, not only to all societies but to nature. In phenomena of co-evolution, such as the orchid and the wasp, two elements double and are thus in excess of one another, but also attract one another as what each lacks. In primitive society, similarly, the

limits which regulate behaviours such as incest are coded and thus the limit remains purely *virtual* (Deleuze and Guattari 2004: 270). Capitalist society is distinct from every other because its limits are constantly being brought into reality as something *lived*, and, indeed, this occupation of the social limit is precisely how capitalist society can dispense with codes. The limit which constitutes capital is experienced in different realms as the limit between payment and credit, production and capital, variable and constant capital, but also as that between desire and work. Money, in so far as it functions as a means of social regulation, *concretises* this limit, makes it a lived reality. The zones of lack and archaism which capital hollows out in the midst of abundance and innovation serve as graphic examples of this.

IV. Realisation, Consumption and Counter-actualisation

The realisation of the surplus-value immanent in commodities is necessary for the maintenance of social authority since realisation, and not production, is what governs the distribution of desiring-machines: 'Furnishing or realizing surplus value is what establishes recording rights' (Deleuze and Guattari 2004: 12). Social authority is dependent on the ability to realise surplus-value and thus crises of realisation are part and parcel of capitalist reproduction. If capital cannot accommodate itself to the expansion of products and markets which its reproduction necessitates, it will enter a period of crisis; surplus-value will be produced but will not be realised as profit. All crises are crises of realisation in this sense. 'The entire mass of commodities . . . must be sold. If this is not done, or done only in part, or only at prices below the prices of production, the labourer has been indeed exploited, but his exploitation is not realised as such for the capitalist' (Marx 1972: 244). The barriers to realisation were known to the political economy of Marx's day but were explained, for example by Ricardo's theory of rent, by factors external to capital. It was Marx who discovered that the barriers to realisation arose out of the antagonism, internal to capital, between the conditions under which surplus-value is extracted and those under which it is realised as profit. Similarly, we can say that Deleuze and Guattari were the first to discover the disjunction between the productive conditions of desire and the ideological conditions of its consumption.

What David Harvey calls the 'structural problems of realization' can be read, then, following *Anti-Oedipus*, as the problem of how capital manages to displace its interior limits, encountering them as something external but constantly redrawn at a further remove (Harvey 1982: 87).

Deleuze and Guattari's analysis proposes that capital fabricates a psychic interiority which places these limits inside the subject itself, forcing the subject to occupy them *libidinally* as psychic repression, as the trauma of the family romance, as dream and fantasy, as psychotherapy and hospitalisation (Deleuze and Guattari 2004: 338). The fundamental argument of *Anti-Oedipus* is that capital's limit, while being perfectly real and concrete, produced as it is by desire, is populated with the fantasy figures of an archaic authority, *mommy and daddy*, as a condition of desire's realisation. For this reason, we need to think in terms of three elements in the ideological process: 'the repressing representation which performs the repression; the repressed representative, on which the repression actually comes to bear; the displaced represented, which gives a falsified apparent image that is meant to trap desire' (Deleuze and Guattari 2004: 125). Desiring-production, as distinct from social (re)production, always occurs at the limit of society, but the synthesis of conjunction is deemed illegitimate when it derives what lies beyond the limit from the limit itself. In the Oedipal drama, the subject's desire is constituted as a function of the paternal proscription from which the desired object, the mother, is derived. The social limit is thereby lived, but only as dream, fantasy and the representations of the subject. This is precisely how 'unconscious material' is fabricated through the synthesis of conjunction (Deleuze and Guattari 2004: 345).

The problem from the point of view of the capitalist is precisely that the consumption powers of the worker are constantly being undermined by capital itself through the impoverishment of workers. The capitalist deprives the worker of the greater part of his product, not in order to consume directly but to sell at a profit. But the proletariat, precisely because of their exploitation, are incapable of buying all the commodities they produce, and so capital must constantly find new means of disposing of its reserve, discovering new markets (whence imperialism, but also the psychoanalyst's consulting room) for realisation. Capitalism, then, brings into being models of realisation which do not necessarily involve consumption, and which may be explicitly ascetic. As Deleuze and Guattari write:

> Marx has clearly demonstrated the importance of the problem: the ever widening circle of capitalism is completed, while reproducing its immanent limits on an ever larger scale, only if the surplus value is not merely produced or extorted, but absorbed or realized. If the capitalist is not defined in terms of enjoyment, the reason is not merely that his aim is the 'production for production's sake' that generates surplus value, it also includes the realization

> of this surplus value: an unrealized surplus value of flux is as if not produced, and becomes embodied in unemployment and stagnation. (Deleuze and Guattari 2004: 255)

As a result, capital includes as part of its vast productive process a moment of antiproduction, something which prevents immediate consumption. Indeed, capital can be defined as the unity of production and antiproduction, since what intervenes in order to separate the producers from the product (the State, its police and its army) likewise function to prevent consumptions, even on the part of capitalists, which do not serve the interests of capital. There must be something to prevent unfettered technological advancement, a flow of stupidity to counter the flow of knowledge; there must be an asceticism to counter the flow of excess, and an archaism to counter the tendency towards absolute deterritorialisation. Capital produces far more than it can accommodate, and so must bring its vast resources of repression to bear on whatever escapes realisation.

This conceptualisation represents a recurring theme in the history of Marxism. Rosa Luxemburg in her *Accumulation of Capital* famously proposed that militarism and imperialism provide the vital markets in which surplus-value is absorbed or realised. Sweezy and Baran, in their landmark book *Monopoly Capitalism*, suggest that the problem of absorption becomes ever more pressing when capital enters its late, or monopoly, phase where price fixing and centralisation become the norm. The problem, however, must be related back to what Marx, in volume three of *Capital*, considered the central law of capitalist accumulation, the so-called law of the tendency to a falling rate of profit. As Marx explains:

> proceeding from the nature of the capitalist mode of production, it is . . . a logical necessity that in its development the general average rate of surplus-value must express itself in a falling general rate of profit. Since the mass of the employed living labour is continually on the decline as compared to the mass of materialised labour set in motion by it, *i.e.*, to the productively consumed means of production, it follows that the portion of living labour, unpaid and congealed in surplus-value, must also be continually on the decrease compared to the amount of value represented by the invested total capital. Since the ratio of the mass of surplus-value to the value of the invested total capital forms the rate of profit, this rate must constantly fall. (Marx 1972: 213)

What this means is that even if the rate of surplus-value grows, this can only be *expressed* in an ever decreasing rate of profit. Marx schematises

this as follows: if a capitalist employs 100 workers for one week and pays out £100 in wages (variable capital) in order to produce £200 worth of total product, then the rate of surplus-value is 100%. But if we suppose that the same capitalist spends £50 on constant capital (machinery, raw materials) the rate of profit will be expressed as 66 2/3%, if he spends £100 on constant capital it will be 50%, and so on (Marx 1972: 211). Increasing technological development entails a relative decrease in the amount of labour and an increase in productivity, leading to a general glut of products and an increasingly impoverished proletariat incapable of purchasing them. As a result, even if the *absolute* rate of profit goes up, the rate of profit *relative* to total capital (constant and variable) decreases (Marx 1972: 220).

A number of influences counteracting the falling tendency have been noted by Marx and others writing after him. All of these influences, whether they involve the depression of wages or the channelling of money into bureaucracies such as civil government and social welfare, into military spending and public works, are ways of devaluing, depreciating or destroying capital.[15] Deleuze and Guattari reinterpret this from the unique perspective afforded by schizoanalysis. The schizophrenic is produced in the same way as any other commodity but with the vital difference that the schizo is not saleable; the desire of the schizophrenic is produced by capitalism but is unrealisable in it, whence the repressive forces of psychiatry, anti-psychotic drugs and the asylum, all of which are means capital finds to counteract the unprecedented liberation of desire it precipitated (Deleuze and Guattari 2004: 266). The neurotic, on the other hand, is perfectly realisable, and neurotic illness has provided capital with a whole new set of markets (therapy, anti-depressants, and so on). It is for this reason that Deleuze and Guattari condemn the practice of psychoanalysis as 'a gigantic enterprise of absorption of surplus value' (Deleuze and Guattari 2004: 260). Psychoanalysis, in other words, contributes to the diffusion of antiproduction, that bourgeois asceticism on which realisation depends, in that consumption in the realm of fantasy is no consumption at all.

Realisation, then, is opposed both to production and consumption proper. In *Difference and Repetition*, Deleuze distinguishes the virtual from the possible, arguing that while the possible is *realised*, the virtual is *actualised*: 'The possible is opposed to the real; the process undergone by the possible is therefore a "realisation". By contrast, the virtual is not opposed to the real; it possesses a full reality by itself. The process it undergoes is that of actualisation' (Deleuze 1994: 211). The social limit, which the schizo occupies, is in no way realisable (its realisation is its

displacement) but *is* actualisable. To the extent, then, that actualisation is opposed to realisation, we can argue that every actualisation is already a counter-actualisation to the extent that the latter de-realises a corresponding realisation. This, in fact, is in accordance with Marx's own conception of the influences which counteract the falling rate of profit, since these influences are literally *destructive* of capital. Counter-actualisation, then, must be seen as part of capital's self-destruction, since it signifies the production of something unrealisable in the heart of capital itself. As long as the falling tendency and its counteraction are regulatory, this secures the immanentisation of capital. Legitimate consumption, on the other hand, would be a deregulating counter-actualisation, a displacement of the limit *common* to both desiring and social production, not the displacement of one into the other.

If realisation involves the calculation, or cancellation, of difference, then legitimate consumption always involves something incalculable and unrealised, a *remainder*: 'the conjunctive synthesis . . . implies a veritable migration of the remainder or residue' (Deleuze and Guattari 2004: 359). The schizo then, like the worker, receives a 'share of the product', of 'what is left after each division' (Deleuze and Guattari 2004: 17). But, unlike wages, which serve to reproduce labour-power, this share remains unrealised. In *Difference and Repetition*, Deleuze describes the process as follows: 'God makes the world by calculating, but his calculations never work out exactly [*juste*], and this inexactitude or injustice in the result, this irreducible *inequality*, forms the condition of the world. . . . [I]f the calculation were exact, there would be no world. The world can be regarded as a "remainder"' (Deleuze 1994: 222, emphasis mine). These remainders can be found migrating everywhere on the body without organs of capital as what capital cannot consume, and from these remainders we make our own bodies without organs.[16]

V. Conclusion

Anti-Oedipus gives us a coherent and compelling account of how capital constitutes 'a whole field of immanence that is reproduced on an always larger scale, that is continually multiplying its axioms to suit its needs, that is filled with images and with images of images, through which desire is determined to desire its own repression' (Deleuze and Guattari 2004: 407). Deleuze and Guattari exhort us to think this process of immanentisation in terms of three different planes of the body without organs of capital. First, there is the plane of the unequal productive relationship between worker and capitalist, or desire and machine. This

is the differential in the unequal relationship between the owner of labour capacity and the owner of the means of production constitutive of surplus-value. Second, there is the plane of disjunction or recording on which the two incommensurable forms of money, the flow of wages and purchasing power on the one hand, and the flow of finance and credit on other, come into being to constitute the interior limit of capital. This is the limit that capital is constantly displacing through the cancellation of the difference constitutive of the productive relationship. Third, there is the unity of production and antiproduction which capital needs as a condition of realisation. The great forces of repression (the State, its police and its army) are joined to the permissiveness of the market. The permissive structure *is* the repressive structure (Deleuze and Guattari 2004: 291). Whence, the dualism of capital, which on the one hand produces for the sake of production, but on the other produces strictly for the sake of the capitalist social formation. The ideological function which psychoanalysis performs is the displacement of the absolute limit, which is the exterior limit of all societies, into the relative limit (capitalist reproduction) through a repressing false image of this externality derived from the interior limit of capital and fabricated in the unconscious to be invested and consumed.

Notes

1. 'The question of their relation to marxism is one that is only posed from outside the theoretical work of Foucault and Deleuze; within it, the question of marxism does not arise. At the level of intellectual strategy, it is the positivity of this approach that must be underscored. These authors deploy elements of marxist theory in the process of elaborating something else, a different form of intelligibility of social reality' (Patton 1988: 126). In a similar vein, Isabelle Garo argues that the appeal to Marx was a convenient way of opposing the wave of reactionary sentiment which followed May '68 but was never internal to Deleuze's thought (Garo 2008: 65–7). Manuel DeLanda, meanwhile, avers that 'the Marxist tradition was like [Deleuze and Guattari's] Oedipus, the little territory they did not dare to challenge' (Delanda 2008: 174). Patton, Garo and Delanda's comments, although divergent in tone, amount to the same thing: that Marx figures in Deleuze's thought as a sign of *bad conscience*.
2. See for example Hallward (2006: 162).
3. It is not at all my intention here to write Guattari's influence out of the story, but rather to emphasise that his influence must *not* be taken to be a crude politicisation of Deleuze. This much is a prerequisite to understanding Guattari's true influence which, however, is a matter that lies beyond the scope of this paper.
4. Boltanski and Chiapello associate the triumph of neo-liberalism in the 1980s and 1990s with Deleuze's critique: 'Much better in effect, from the standpoint of unlimited accumulation, that the question be suppressed, that people convince themselves that everything can no longer be anything but a simulacrum, that

"true" authenticity is henceforth excluded from the world, or that the aspiration to the "authentic" is only an illusion' (quoted in Callinicos 2003: 11).

5. 'Like Marx, contra Hegel, [Deleuze and Guattari] attempt to set things right by making a new beginning, a new type of beginning in fact, one which, as in Marx, starts with a "rational abstraction", namely production in general (as process). Desire as process, as production, is as much of a corrective as Marx's general production is' (Buchanan 2000: 21). On the importance of distinguishing between desiring-production and desiring-machine, see Buchanan (2008: 49–50).
6. This is the criticism of *Anti-Oedipus* Baudrillard makes in *The Mirror of Production*.
7. Deleuze and Guattari employ the terms 'laws' and 'uses' interchangeably. Whether illegitimate or legitimate uses are at stake, these refer to the same syntheses (Deleuze and Guattari 2004: 127).
8. In *Theories of Surplus Value* Marx writes: 'Productivity in the capitalist sense is based on relative productivity – that the worker not only replaces an old value, but creates a new one; that he materialises more labour-time in his product than is materialised in the product that keeps him in existence as a worker' (www.marxists.org/archive/marx/works/1863/theories-surplus-value/ch04.htm).
9. The history of the debate over the meaning of primitive accumulation goes back to Lenin's *The Development of Capitalism in Russia*, which argued that primitive accumulation was a one-off historical occurrence characterising the transition from the corvée to capitalism. Rosa Luxemburg's famous argument in *The Accumulation of Capital* was that capital necessarily expands into a world system in order to find pre-capitalist markets, and hence primitive accumulation is a continuous and necessary feature of capitalist reproduction. The latter thesis has been instrumental in the conception of postmodern capital as imperialist by Hardt and Negri and Samir Amin, among others.
10. This is Badiou's critique of Deleuze's political theory, see Thoburn (2003: 5).
11. Thoburn argues that, since capital is 'amoral', Deleuze does not need a concept of ideology. Thoburn, however, understands ideology purely as 'belief system' and not, as Marx does, as part of a system of distribution (Thoburn 2003: 94).
12. For a recent example of this type of dualistic reading, see Reynolds (2007).
13. As Brian Massumi writes, 'The power of the quasi-cause is essentially distributive', www.anu.edu.au/HRC/first_ and_ last/works/realer.htm). For the Marx and Engels of *The German Ideology*, the role of distribution is central to the historical development of the division of labour and the ideology of the State:

    > With the division of labour … is given simultaneously the distribution, and indeed the unequal distribution, both quantitative and qualitative, of labour and its products, hence property: the nucleus, the first form, of which lies in the family, where wife and children are the slaves of the husband. … This fixation of social activity, this consolidation of what we ourselves produce into an objective power above us, growing out of our control, thwarting our expectations, bringing to naught our calculations, is one of the chief factors in historical development up till now.

    This 'objective power above us' is precisely what gives rise to the State, which re-constitutes an 'illusory communal life' from 'real ties' (Marx 2000: 184–5).
14. Surplus-value only becomes *calculable* through its realisation as profit. Realisation of surplus-value and cancellation of difference then are to be understood as cognate terms in the discourse of *Anti-Oedipus* (Deleuze and Guattari 2004: 251).
15. See Harvey (1982: 84–5) for a discussion of these terms.

16. Finance, for example, while representing a flow which facilitates realisation through banking power (credit money constitutes purchasing power), cannot itself be realised (Deleuze and Guattari 2004: 249; see also Deleuze 2006: 12).

Marx as Ally: Deleuze outside Marxism, Adjacent Marx

Aldo Pardi Université Lille III

Translated by Daniel Richter

Abstract

Deleuze reworks Marxist concepts in order to identify those that represent discontinuity and produce a theory of revolution. Marx is important because, along with Spinoza and Nietzsche, he is a part of a project to leave behind concepts such as transcendence and univocity which underlie the totalitarianism of traditional philosophy. Deleuze is looking for concepts that might form a different theory, within which the structures of production are not organised vertically by the domination of universal concepts, such as 'being' or 'essence', but flow horizontally through a multiplicity of relations of conceptual singularity. The production of a different series of concepts is a strategic and tactical operation that, in confronting prior notions of transcendental philosophy, turns philosophy itself into a battlefield. Marx provides the general methodology for this tactical approach through two fundamental categories: production and conflict. Deleuze practises Marx's theoretical method and by using Marx's own central concepts challenges traditional Marxism, to arrive at a totally different and revolutionary philosophical structure based on concepts such as those of force, variation, difference, singularity, production and the war machine.

Keywords: Conflict, production, forces, linking, battlefield, substance, immanence, transformation

Marx is at our side. That is to say, to reconstruct a thought worthy of a possible revolution means to cross the threshold of Marx. He has always been thought of as the eldest brother who, representing the beginning of a lineage, assigned and distributed roles and positions within a family tree. Half-father and half-mother, Marx was the reference necessary

and sufficient to recognize oneself, to define oneself in relation to an identity. Marx was at the same time a space of thought and a field of activation, the precursor who had already accomplished in advance all the events brought about in his name. He was the first projection of the origin, the necessary process of history, and the identity of the motor which pushed it onward. Each event related to Marxism was, and presented itself as, the accomplishment of a potential which history had until then kept hidden within its folds. Marx therefore himself contained that potential, as an iconographic image of the general form of thought. But what thought? What thought did Marx incarnate? The lineage that the Marxist tradition always wished to attain in making of Marx the first son of a revolution already present and given in its ideational terms: consumption as necessary passage, but so determined, between *production* and *appropriation*, and the motor which powered the two moments which accomplished each other. The first was called 'natural dialectic of need and consumption', or 'nature'. The other was denominated 'subjectivity'. Nature is a dialectic process that circulates inside of a network of organic functions organised inside of a superior system, the corporeal organism. Production appears as an exterior application of its biological articulations, in their turn the formation of one sole model. This model remains the accomplished figure of the natural character of the organism and does not ideally guide its manifestations.

The continuity that links function to satisfaction is guaranteed by need. Need is the *a priori* form which gives to function its structure, the direction for its undertakings, the sense of each cogwheel which constitutes its mechanism. Need is the carving tool that gives to the thing the image of a function, in rendering consumption a continual labour of recuperation and incorporation. It is the motor which pushes function beyond itself. It discovers itself in the mirror where the body will coincide with the body of nature. The natural organism is nature itself in the expression of its accomplished totality, form actualised by the resolution already foreseen in its cracks. Nature is not a substrate, a 'hyle', to speak like Husserl, but is the sole content, the ontological horizon that presides over the existence of every phenomenon.

Nature projects itself forward from itself. As positional signifier and thetic signified, it is 'Subject'. It devotes itself to the centring of the circuits which find their necessity in the form they accomplish. Each of them is a variant of the logic of identity which reshuffles nature upon its body. Its homogeneity affirms itself through the centrifugal movement of extrusion that activates it. Its contents are nothing other than itself,

a manifestation which never strays from its origin, for it recalls nothing other than the character which it already was. Nature is the principle of reason that governs all processes by unifying them. Its projections are the figures it assumes in expressing itself. Nature is the invisible and the visible, a source which springs forth everywhere. This originary core remains forever in its properties, and cannot surpass them because it has already brought them back to the interior of its intentionalities. Nature expresses itself in making of existents the signs of a supreme signifier which engraves the marks of one sole meaning. Objects reduce themselves to being the transcendental return of a general principle. There are processes of subjective totalisation everywhere. Once we suppose the existence of a function related to a body, we also admit the presence of its specular double, the thing, and their originary unity. At this point, it gives itself a subjective projection. Needs are always natural needs, even originary intentionalities, of the transcendental substance of the principle. What differentiates the manifestations of nature is not their content, but their gradient of formalisation. We will find givens which are still embryonic, simple inferior moments of the dialectic which activates the passage towards a superior manifestation. We will be able to trace an entire hierarchy of passage which makes the inorganic fall away onto the organic, and from there to superior living forms, to spill eventually into the human, with its capacity for manipulation and management, and its linguistic potential which is a sign of its proximity to the principle. Having attained the human, we installed ourselves at the level of the totality. Human reason is only the enacted position of transcendental contents which qualify the thetic constitution of nature. Man is the adequate expression of its lines of totalisation. Man is nature as given to itself, life as it is exploding forth, the transcendence of reason which makes itself flesh. The body of man, his flesh, represents his intentional projection, which envelops beings, and his totalisation thanks to signifying links which intertwine. Man exercises his needs and works in order to consume: his productive activity is the identity of meaning and signification. For man, what happens in other natural entities is not valuable in itself. The different manifestations of the human are not reference points of a complete signifying expression. Man and signifier are one. He is the model which serves as criterion for other living and non-living elements (for they are also the superior stage envisaged by the non-organic). Man is the universal which is in the midst of living. His existence is totalisation because man synthesises in himself the identity between functions and things, and distributes them all along signifying chains. Functions and things do not indicate the collocation of

the signifying chains in the pyramidal organisations which thought, and even language, have at their summit.

In man the organism and the thing complete each other in a perfect identity, assured by consumption. Consumption is the link which makes of any thing a human object: the other dimension, the other face, the second aspect, reversed, of the breaking forth of the life of man in a completely human world. Consumption demonstrates that beings are only pieces of the enlarged universe of humanised nature, that is to say, of complementary modules of a milieu which does not exist if not as a human signifier. They are managed and distributed according to the order of signification which emerges from its projections, declinations of a universal principle which proffers itself in its acts.

Once man has been mentioned, we are directly addressing society. The totalisation of nature in the human anticipates a definition of man as a general collectivity, a global horizon of human characteristics and their intentional contents, an extensive milieu which invests the entire space of existence. Society is the human in its totalisation. It holds in all its partitions the same adequation between thetic signifier, signification and meaning. Once again, it is the circuit of consumption that takes on the value of logical sequence which strings together the active tension of social subjectivity with all the forms which constitute the lines of sense. The process of assuaging that fashions beings in the blast furnaces of human expression causes the piercing cry of totalitarian reason to resound. Each being is the song which glorifies its perfection; each thing is a sign which indicates it; all movements are signals which indicate it, the rays of one sun which recall its source, light.

In nature, only the interior exists. The form and actualisation of this absolute interior is consumption. The subject is a total subject, constituting inasmuch as it is capable of appropriation. Man realises his materialisation at the level of transcendent principle because he is by definition the being who has needs and *thus* speaks and works. He satisfies his needs as it is given that his acts are the universal origin which totalises itself as society. He comes *a priori* from a general social milieu that represents rational value. We can thus say that a thought of the individual as such is impossible. Every time an attempt was made to reconstruct humanity from man in shared milieus by glances met from far away, it was discovered, at times with horror, that the human was a concept which has society as its form. However, what is more important is that this human society is *regulated*, which is to say managed, in one way or another. The universal rationality which displays the essence of the human spreads its manifestations about according to an order.

Society, which does not represent acts, finds in itself the logic that allows production to attain its ends. Society is always rational, even in its dysfunctions. It moves in forced conduct which forcibly drags the signifier to meaning.

Human society is a transparent collectivity that governs its manifestations while containing within itself the identity between actions and significations. This is the heritage that Marxist thinkers, among others, wished to claim. Need/production and subject/society is the grid that realised the circulation of the ontological principle in its forms, and the schema which gave an accomplished definition of the transcendental coordinates of the existent. Marxism was the conception which could bring thought to its goal by ending the problem of history. It went beyond the limits of bourgeois thought which, stuck in its divisions and dichotomies, did not succeed in holding the four together, as the wooden legs of a theory of universal history, adequate to its object.

But again, what thought? And why was history a problem for thought? Once again these questions remained open, but unasked. In fact, they were the same which invested the famous 'adversarial' field. If this thought was essential to the philosophy of Marx, its ends were not to be distinguished from those of other philosophies. Surely it was a step forward in relation to them. However, the categories, the theoretical structures and the conclusions inhabited the same terrain. The grid of history targeted by Marxism also marked non-Marxist thought. The circularity that linked need, production and thing, and the historical process of subjectification which one could pull from them, were the points of departure of all the theories which made of the position of a transcendental form the fundamental task of a possible ontology.

We can construct the passages of this strategy of conquest, this imperial campaign of thought directed by exceptional strategic intelligences. We could start with the Platonic partition of the four genres of knowledge, which found the asymmetrical equilibrium of all that is by organising it into a hierarchy between matter and idea. We could continue with Aristotle, who made of the accomplishing of souls, through their productive activation, the articulation of a universal substance having the same quality of realness. We can follow that with Augustine, who understood that time was the movement of totalisation which allowed need to jump beyond the finite and establish itself directly in the universal principle that spreads out everywhere in order to take hold of every thing. We can see how Hobbes made scissions produced by needs, i.e. the drives, in order to fold history onto the linear dynamic which appeases them in a principle that was henceforth socialised, which

finds in its social form the very foundation of its transcendence. We can cite Descartes and his operation of negation of the existence of need, which was necessary in order to subjugate it to the ideal equation that regulates the correspondence between the absolute nature of subjective projections and their transcendent dimension.

But the man who accomplishes this long search through the centuries is Hegel. Hegel realised the project of rendering the spread of needs in contingence, the realisation of their transcendence, by unifying it in one sole and unique movement of totalisation. It is the principle itself that is affirmed in the scissions of the finite, for they are only the unifying and necessary journey which assures complete extension. Beyond its movement there is no existence. Everything begins from nothing: the nothing of reality which exists at the exterior of the universality of the constituting foundation. It is already its beyond, projected, in any of its parts, to the celebration of its completion. It imposes itself by making of the negativity of the contingent a linear process of which each moment is a sign of its manifestation. It is in its end, as intrinsic goal of its absolute existence. It is absolute spirit, a transcendent principle which arranges the real according to its effusion. There is no longer in Hegel a distance between contingence and foundation. Absolute spirit is at the same time contingence and subsistence. Hegel's operation is unheard of: all beings are organised into a hierarchy and forced to submit to the interior of a system of domination which enlists them into its regiments. It is not limited to assigning them forcibly an order of position, that is, a determined value proportional to the portion of totality which it incarnates. It also imposes upon them their form, their possibilities, their behaviours, and thus, their goals. All objects are the intentions of one sole source of activation. Absolute spirit is subject, possessor of its spiritual body: the dialectic of opposites, the negation of negation, expresses its activation. History is its property, and is controlled by it. It is an extraordinary, dominating power, and it is no coincidence that its definitive affirmation happens with the State. To attack Hegel is to go in the opposite direction of the pestle of the totalitarian thought of transcendence. Deleuze understood this well: 'What is philosophically incarnated in Hegel is the enterprise to "burden" life, to overwhelm it with every burden, to reconcile life with the State and religion, to inscribe death in life – the monstrous enterprise to submit life to negativity, the enterprise of resentment and unhappy consciousness' (Deleuze 2004b: 144).

The State, as separated but immanent mechanism, is the scaffolding which harnesses all of reality's movement. Need, labour and

consumption are the movement accomplished by the State to assimilate reality. They are, under the name of 'civil society', the properties incorporated by this total conscience which presents itself in the form of order and organised human society into a hierarchy as totalising expression of an apparatus which is in itself totalised (and thus collective), thetic, and constituting. In other words, its primacy is explained by its nature as absolute reason, originary and universal conscience which imposes its norm. Its power affirms its supreme law and its infinite power of control.

Is it possible to embark upon another project, in another direction? Was it possible to search for a different route? Was it a hopeless enterprise to push through the history of domination in order to arrive at a path of liberation? Was it possible to wrench theory away from its ostensibly natural task of affirming in the sign the power which makes of every layer of reality the object of a tremendous domination? The problem was that of manoeuvring oneself as an alternative force through thought. One had to make war against the power which forced signs into submission, in order to join with experiences of emancipation which struggled against the actual form of domination, i.e. capitalism. Besides, Hegel, the steel point of occidental philosophy, had been responsible for making of history the living presence of the transcendent principle, in order to transform the government of the bourgeoisie into the completed reality of absolute reason under the State form. It was necessary to free oneself from the problems which led to the imposition of a government founded upon transcendence. To embark upon the path to liberation meant to draw theory out of the dialectic game which rendered nature the concretisation of the subject, and the subject the proper name of nature. One had to put on the map an 'other' project, to make of thought an escape, instead of a place of integration. The tactic and the strategy of this 'at the limit' experience should have been twofold: 1) the desegregation of transcendence and the idea of the negative, which sustained it; 2) the affirmation of a scission, which would enable extrication from the process of totalisation.

It is in this direction that Deleuze engages philosophy. From the beginning of his theoretical work, he embarks upon a lateral movement, traversing philosophy diagonally in search of faults capable of opening out upon the possibility of liberation. It is a veritable combat strategy against the normalising conceptions of transcendence and domination.[1] Of course, it was not an explicitly declared struggle, the sort that provides a small pleasure which comforts narcissistically with self-recognition in what are only self-aggrandising good deeds. It was not a

question of small transgressive reassurances which give the impression of omnipotence. In Deleuze, there is none of this sort of hidden complicity with the ideas he fought against. He did not seek self-affirmation through attention-seeking gimmicks, similar to many philosophers who remain attached, in a sort of eternal adolescence, to the idealisation of daddy-theories from which they believe themselves emancipated while remaining all the more dependent. Deleuze constructed piece by piece his theoretical strike forces with the concentrated silence of the artisan who is one with the labour he is accomplishing. And like a true artisan completely immersed in the process of creation which is not himself, because it is only a movement of fashioning that comes from the outside and renders him an anonymous field of transformation, Deleuze cultivated the silent calm which gives speech, one could say humbly, to the piecing together of a work which springs up like a collective construction, and never becomes the auto-referential din of a paranoiac individual haunted by himself.

What he practised was a revolutionary action of a theoretic gesture towards escape. In positioning himself in order to perceive experiences of rupture that produced new regimes of signs in the arts and in literature, he allowed himself to be contaminated in order to render thought a *part* of a constellation of forces, and no longer the solitary birth of a sage, of a 'philosopher', but the collective construction of all the dissociations which constitute the pluralist fields of alternatives to domination.

Thought must reconstitute itself as a network of an apparatus of productive extrication. It should not return to a social base superimposed upon its second manifestations, it must in itself socialise itself. It must become an institution:

> We are forced back on the idea that intelligence is something more social than individual, and that intelligence finds in the social its intermediate milieu, the third term that makes intelligence possible. What does the social mean with respect to tendencies? It means integrating circumstances into a system of anticipation, and internal factors into a system that regulates their appearance, thus replacing the species. This is indeed the case with the institution. It is night because we sleep; we eat because it is lunchtime. There are no social tendencies, but only those social means to satisfy tendencies, means which are original because they are social. (Deleuze 2004b: 21)

We must practise theory as a curve that tears the law away from power, assemble an entirely new toolbox that can bend thought and provoke in it radical scissions. In this sense Deleuze disperses the traditional concepts, in particular those of 'nature' and 'subject', while

traversing practices of thought which made of movement and change precarious equilibria, always problematised by the social components which engendered them, or their field of production. Deleuze works on Hume (Deleuze 2001a), Bergson (Deleuze 2001b) and Kant (Deleuze 1984). In Hume, he takes up again the idea of nature composed of sensible processes, a transferential collation which forms a socialised imaginary. This phantasm is on the one hand a partial mechanism of management of sensible stimulations, and on the other a schema of regulation of practices which activate it. Hume's problem is to emphasise the juridical rather than ontological nature of natural associations, partial applications of processes of the management of complex systems of partial practices of regulation.

Bergson is the philosopher who first proposed the theme of change at the heart of a possible ontology. After Bergson, reality is only visible if one considers it from the point of view of time which passes by while changing its connotations. This passing does not accomplish a given present, i.e. the return of a stasis which reaffirms itself each time. It is the past which presents itself as an already passed instant. Reality is the leap forward which is always overtaken by a leap which overtakes itself. It carries along with it all beings by projecting them far from their constituted form, a transformation which has already happened, and in spite of this, is in the process of realising itself again. Life is loss and forgetting, for it is evolution which creates through detachment and difference:

> The Bergsonian question is therefore not: why something rather than nothing, but: why this rather than something else? Why this tension of duration? Why this speed rather than another? Why this proportion? And why will a perception evoke a given memory, or pick up certain frequencies rather than others? In other words, being is difference and not the immovable or the undifferentiated, nor is it contradiction, which is merely false movement. Being is the difference itself of the thing, what Bergson often calls the *nuance*. (Deleuze 2004b: 25)

Kant revolutionises the theory of knowledge by producing a double movement of scission. On the one hand, he blocks the relation between thought and the immediately given sensible; on the other, he breaks apart the universality without individuation of ideas founding traditional metaphysics (God, soul and world), empty representations of a being without positive manifestation. The faculties, and in particular the faculty of knowing, support intuitive dynamics which intertwine with ideas strung together by functional relations, qualified by their proper

content. Their general character does not escape the indetermination of their form, but is their result, rather than the necessary effects of figures taken by the two coordinates which are closer to any experience whatsoever: space and time. They preside over the movements of coupling that reunite the sensible elements into series, arranging them in ordered relations where each spatial point connects to the next according to the parabola traced by the instants of time. Since space and time are the principles of constitution of the objective syntheses, they come before and after each real manifestation. They contain within them all sensible elements, since these latter are only their phenomena, partial moments, *a posteriori*, of a network of normal relations *a priori* which reconnect the extension of all existence. Space and time are the universal forms which govern the consistence of reality in terms of conceivable subsistence. It is the reason of proximity that discharges an infinite complex of points in a dynamic which assigns them form and function, returning them to the norm that brings them together. They remain above things, principles of an ideal constitution that selects the phenomenal modalities of the presentation of beings. A concept, an existing given, finds its objective dimension in the regulated constellations which unite it with elements composed by a law which transcends them all. Space and time are thus the transcendental principles of a normalising activity which informs experience. They manage to fill the totality of what exists by affirming the norm posed by their twistings and turnings in such a way as to represent presence enacting the universal. They must remain detached from empirical reality.[2] They compartmentalise inside of a specific and general physical equation an infinite number of sensible impressions, whose concrete character is assured by their collocation in the spatio-temporal relations. They cannot be confused with an individual given, an empty content-less box incapable of finding its qualification. They surround the complex evolutions which dig through existence from one end to the other while forcing them to become the points of application of a disciplinary power which surpasses them as proper variations.

The Kantian universe is an infinite outpouring of equation where space is arranged in relation to unities of time. The collocation of objects in space is a function of temporal diagrams which do not regulate their relations. It is thus time which commands, and it is time which divides the idea, or the active expression of the law, from the sensible reality it incorporates into norms. However, the scission which separates forever the concept from the individual matter subsists while imposing obstructions. They prevent each position of existence that works to found the universal in the immediate apprehension of a universal given

without passing through the categorical grid which gives its 'normal' quality to the object. Reason falls into its amphibologies when it wishes to attain the infinite in one stroke. This is the defeat of any metaphysic that would like to assign itself the value of a first ontology. The general norm that governs the existent establishes itself by seizing the dynamic of constitution which, in surpassing the particular, attaches it back infinitely to its global application. The law is a categorical content sprung from a general stratification of synthetic mechanisms of regulation. This is why space and time are always ideal factors, and the activity of transcendental constitution of real series is a production of concepts in the form of singular indices, despite being plural, of formal discontinuities. From this it follows that judgements are *a priori* active intuitions of an activity of knowledge which is the mirror of an ideal plane that ceaselessly develops.[3]

Deleuze does not approach these authors in order to assign them a perfunctory interpretation. He does not unearth their 'veritable' spirit in order to offer it forward to the reader in the form of a lifeless review. His reading is already engaged in a theoretical project which is the affirmation of a political position inside of theory. He crosses paths with philosophers according to the requirements of his own travels, pushed by strange meetings which emerge from a foreign collocation inside of philosophy. His experience of thought does not take off vertically, from a base to a summit, but moves horizontally while it encircles, through scission, a plane of conceptual construction where each thesis is at the same time a rupture, an overlapping and an aggregate.[4] In describing these hyperboles, theory is separated from its spiritual ghost to offer itself up to shapings provoked by cracks which trouble the identity of its concepts. Philosophy is no longer the lightning flash that reveals the essence, but the practice of difference which resides in the theatre of relations between elements which intertwine.

We must leave behind us the grid of totalisation, hollowed out by the dialectic binary nature–subjectivity, of which Plato defined the assumptions and which Hegel brought to its conclusion with his idea of the 'negative'. Deleuze begins to produce thought in difference, exploiting the power of liberation it contains:

> It is as though Difference were evil and already negative, so that it could produce affirmation only by expiation – that is, by assuming at once both the weight of that which is denied and negation itself. Always the same old malediction which resounds from the heights of the principle of identity: alone will be saved not that which is simply represented, but the infinite representation (the concept) which conserves all the negative finally to deliver

> difference up to the identical. Of all the senses of *Aufheben*, none is more important than that of "raise up". There is indeed a dialectical circle, but this infinite circle has everywhere only a single centre; it retains within itself all the other circles, all the other momentary centres. The reprises or repetitions of the dialectic express only the conservation of the whole, all the forms and all the moments, in a gigantic Memory. (Deleuze 2008: 65)

According to this method, one touches on philosophies in order to locate the necessary gears of an engine which does not realise itself from total notions. It must act as a sort of drill which pierces a hole in the domination of transcendence and its hierarchies. Deleuze addresses himself to theories which made of difference the centre of their questioning, to theses which took speculative knowledge as the point of departure of a practice of putting into question, and not as its solution. This is how Deleuze meets Hume, Kant and Bergson, from the angle of the crises which they provoked in thought. It was said that these were arbitrary operations of interpretation, at the very limit of thought, and this is true: they deliberately abandon the fact that Hume finds his equilibria in the dependence of institutions upon sympathy, that Bergson submits change even more to transcendence in making of time a life force (*un élan*) towards a personal absolute being which accomplishes unheard-of creations, and that Kant twists the ontological superiority of the general idea into the immanence of space and time in order to inject it directly into the particularity of the sensible. But Deleuze was well aware of this, to the point that these conceptions are used by him to strike the foundations of ontology, and to invade its field itself through the place where it seemed the most secure: the grid which orders reality in the specular game between 'nature' and 'subject'. They were only bridgeheads which served to break the defences of theories of transcendence and begin to ravage them: 'Precisely, by virtue of those criteria of staging or collage we just discussed, it seems admissible to extract from a philosophy considered conservative as a whole those singularities which are not really singularities: that is what I did for Bergsonism and its image of life, its image of liberty or mental illness' (Deleuze 2004b: 144).

In order to reach a position, we first must decompose the lines of the adversary. This action had to be accomplished by detaching the domain of signs from the problem of the position of reference. One intervened in signification by breaking, with the hammer of paradox, the closed triangulation which connected designation, manifestation and even signification itself, henceforth dispersed in the proliferations of

propositions which produce uninterrupted series of predications, points of crossing of plural lines of sense. The first was the task of *Proust and Signs* (Deleuze 2000), the second the undertaking of *The Logic of Sense* (Deleuze 2004a). But this is still not enough. The decomposition of transcendence could succeed in a real upheaval of the philosophical field only in attaching to the decomposition of the centred structure conceptual totalisations of apparatuses capable, in the same moment, of affirming a new arsenal of concepts: no longer valuable transcendent ideas such as origins and ends in a closed circuit of biunivocal and polar designation, but zones of contact, connectors, pressure points, of detachment and connection; practical exercises of uncoupling and grouping in which pluralities of elements divide in a conflicting field, the horizontal plane of serial organisation realised by scission. Deleuze accomplished this task before and beside his search for an escape from thought dominated by *ressentiment*.

He begins by positioning himself to listen to the affirmative practice of Nietzsche's thought. He gives Nietzsche the density of the sensible in placing him in the positivity of conflicting contacts which related singular elements to each other: this is the theme of *Nietzsche and Philosophy* (Deleuze 2002), Deleuze's second book.[5] The quality of these components is not defined negatively, in relation to an essential nature given in advance. They are dissolved and recomposed in the reversals of asymmetrical engagements, effects of their meetings. This quality is discovered via evaluation, that is to say by a line of division which regroups forces among themselves by splitting them away from the others, themselves grouped in plural and singular constellations. This cut which welds complex and articulated bodies is what Nietzsche will call 'will'. Thus, the content of partial segments is defined by orientation and position in a striated space of conflict.

These divisions criss-cross the formations, abandoning them to conflictual games which harm every attempt at identitary formation. The shocks' blows repeat tirelessly, similar to a throw of the dice which falls back into the same modality without ever producing the definitive combination. The detaching of constellations prevents there from being an interruption of the division which the objects of a group remove in order to unite them to another. Things enter into a combat which distributes them into infinite series of scissions, a laboured earth in which they are affirmed by movements of conflictual disintegration and differential formation. They are forces, sensible bodies that traverse the terrain opened up by their tactics of combat. This terrain, a veritable desert, does not know time, because it is the eternal return of an infinite

plurality of effects, a sliced up surface that transforms itself and becomes in relation to figures created by the scissions.

'To think' is no longer anything to do with an essential glance, with reflection which looks down upon existence while judging it according to its principles; it is action, strategic practice, a politics of construction of conceptual bodies. This relational activation is affirmative inasmuch as it does not refer to anything. The dynamic of forces poses their content and their signification. It expresses the political tasks which produce their movements. Their becoming is necessary inasmuch as it has no other reference than the changes effectuated by their counter-blows. The necessity which Nietzsche is talking about is the recognition, always situated, of a strategic chessboard which draws out a political cartography. Thought is a topological art, a geographic designation of places where bodies hit against each other and divide up the earth into distinct domains.[6]

A force can never become universal. It is the fruit of a plural complexion, engendered by determined encounters of singular elements.[7] A body is always situated by relations to a field of manoeuvres where other forces already assumed places. If a body is composed, it is by seizing hold of elements which are parts of complexes present on the terrain. If an aggregate is taken apart, it is because it was swallowed up by an apparatus capable of incorporating it in its own process of aggregation.

It is this strategic chessboard which splits up bodies between dominating and dominated. The dominating forces are those which succeed in becoming by attaching composites to their body. They are thus active aggregations. The dominated forces are subjected to a process of fragmentation, second form of activation, and submit to the dominating forces. This difference separates the forces qualitatively. It traces the equation which distinguishes them as different natures: the differential relation which defines their activation potential. It does not follow that the quality of forces is a question of *quantity*: the more bodies realise anchorages, the more their power of formation grows, the more the forces become affirmative. The concept of the 'will to power' expresses the practical action which posits a domination that criss-crosses the genealogy of asymmetrical relations that realise the singular constellations of bodies.

Force–domination: these are the first categories of a new image of thought. They dislocate it inopportunely, a never-finished world made of impersonal individuations or of pre-individual singularities.[8] And nevertheless, it would not be possible to guide it back into this

practical dimension where the vitality of conflicts erupts without another theoretical operation. This intervention must block the framing of the existent in the unconditioned supremacy of a transcendent essence. The figures of the 'negative' subdivide beings in proportion to their proximity to the last principle, all the while furthering them from the being which, always beyond them, remains frozen in a single point of concentration. The effacement of the negative must pass through a definitive prohibition of all possible ontology. We must construct concepts which do not possess any ontological value, and begin to act theoretically in another sense, on this earth, irreducible to any unity, worked upon by the political effects of encounters between sensible bodies. To do that means to relinquish the thread of mutual recallings that allowed the universal and the singular (which is, besides, its negative image) to take hold of the entire space of theory, forcing it to mechanically repeat the same act: the analogical judgement which forced all beings onto the One and the Same. We interrupt the vertically moving vicious circuit that makes of objects simple variants of a general biunivocal relation, equalising them on a plane without exteriority, the transcendental condition of *immanence* which only admits singular variations. Spinoza's concept of 'substance' and his theory of power give to difference the force to assail all constituting ontology (Deleuze 1992). There is only one plane, the egalitarian dimension where the eminence and ideal consistence of transcendent contents are reduced to formal variations. Apparently, each being lays claim to an essence. We must admit a plurality of eminent entities which found all the levels of existence. But how can we discover the difference of ontological constitution among these beings? How will the absolute nature of being not be touched by the presence of these other 'minor' essences? There will be a multiplication of these substances which will lay claim to all their rights. They will have to settle for sharing the transcendent constitution of the first essence. How is it, however, that elements of the same nature are differentiated? The relation between beings and existence, and the successive distinction by '*genux proximo et differentia specifica*' are abolished in their own logical possibility. There is only infinite immanence where the substance will equalise all elements. The movement of elevation that poses a transcendent instance is deprived of its own presuppositions. If there is no transcendence, it is impossible to acquire the ethereal nature that gives to essences their metaphysical flesh. Substance is only a single material block (Deleuze 1992).

On the other hand, as it is impossible that something is totalised while proposing itself as first essence, neither is substance ever totalised

retrospectively, in affirming itself behind things in terms of creative personality or first cause. This is the fundamental argument Spinoza makes against Descartes. Substance exists in its singular manifestations because it is nothing other than singularities which cannot be totalised. And since there are no universal entities, substance varies in its infinite series of controlled modulations. The attributes – although we know theoretically only of two, namely thought and extension – are infinite, and function by putting substance back in circulation at the material and egalitarian level of existing singularities. Attributes contain substance's infinite modalities of pluralisation. Attributes continue to pulverise substance into singular formations which do not designate their intrinsic multiplicity. Nothing interrupts this collective distribution of contacts and disjunctions. It poses the insurmountable limit for beings. This is the theoretical motivation which makes of substance a constellation of modes, singular and plural, and assigns them an essence, that is to say, a reason for formation, different from that of substance. It is through the fault opened up by this difference that substance bursts out as a horizon of becoming.

We must take a step back: modes, never capable of beholding themselves like faces of an identical essence, plug into each other at their contours, at their sensible shell. They encounter each other and form relational configurations, linking their members like pieces of a giant machine of production. Substance is the disarticulated factory which lives in its power of production, and *production* is the concept which expresses the specific form of the becoming of substance.

Force–domination and *immanence–production*: this is the new grid discovered by Deleuze at the end of his long deconstructive detour of transcendence and the thought of the One. Now, it is possible to begin again to think positively. It is possible to leave the circle of recognition to construct a 'critical' theory which works to 'provoke crisis' in the simple identification between need and subjective projection, and to work out a revolutionary theory of transformation.

At this moment Deleuze takes up conceptual tools which leave nothing for the adversary. He returns to Marx. But another Marx, the Marx of forces of conflict, of social relations of power, of strategies and war tactics which impose systems of domination, and groups which oppose them. It is the Marx of bloody struggles which tear apart the conformity of the social body and indefatigably transform it. A revolutionary Marx who makes of revolution the practice and content of his theory, and who is close to all experiences of the same signs, at all levels and places.[9] 'Marx' is a plural name, the seal of an alliance: he is the comrade who

fights by one's side, who attacks with goals and blueprints, who shares trenches.

Traditional Marxism took Marx out of his natural place: politics, the struggle against power and its actual form. This was a strange reversal: they took him out of the place where he alone could explain the meaning of his theoretical project, that being political revolutionary practice in theory and in society, hoping that such a sterilisation would clear the way towards an alternative. No, Marx is not the theoretician who realises the dialectic, bringing it to a possible accomplishment which Hegel could not achieve.[10] He did not introduce the most efficient categories with which to force nature onto a subject that would supposedly explain that subject's dialectic development. Determined Marxist analysis is an assault, a political investment of a social field towards an alternative, under the conditions posed by a determined apparatus (mode of production) of the victorious forces, i.e. capitalism. To struggle next to Marx, one must practise another conceptual strategy, one which makes pivots out of production, domination and the immanence of the social field in the conflict of forces, in order clear a path of escape towards another regime, conceptually and also in social practice. It is no longer a question of 'criticising' capitalism, nor of emphasising its backwardness, its contradictions or its irrationality. These are sterile positions, as they reproduce the capitalist ideology of egalitarian exchange through which an identitary subject extends itself all throughout history, or in this case, capital. It can be recognised in the satisfaction of its needs: it is the summit and blossoming of nature, in sum the essence of existent totality (the *homo oeconomicus* of Smith and other classical economists). The only possible critique has already been carried out by Marx. Capital is a combination of forces which compose a mode of production. It is not a neutral movement, set off by the nature of components which will be brought to their accomplishment. Upon forced labour, in its multiple configurations and strata, is engraved the mark of the power of capital: it becomes 'labour force'.[11] It is constrained to act, to speak and think under the weight of capitalist domination. Capitalism is an immense force of disjunction and reconnection of a system of relations which has the production of surplus-value as its goal. Capitalism does not work, as in feudalism, to allow the feudal lord to make wealth the sign of his supremacy. The ideas of the feudal epoch are not associated with a version of nature which proceeds by degrees of minor perfection. This is the nature of capitalism, the decoding which sweeps away the feudal code and projects it into a world of individual subjects which effectuate by themselves the

comprehensive movement of a unique need for exploitation. Labour's submission to capitalism is expressed in a closed social body, full to the brim with the power of its apparatuses of management, selection and control. These apparatuses discipline their subjects in reducing their functions to the circuit of accumulation composed by *conjunction*: 'That is why capitalism and its break are defined not solely by decoded flows, but by the generalized decoding of flows, the new massive deterritorialization, the conjunction of deterritorialized flows. It is the singular nature of this conjunction that ensured the universality of capitalism' (Deleuze and Guattari 2000: 224). Capitalism does not develop out of an interior necessity at the heart of feudalism. It has a genealogy of alliances, combats and tactical positions taken to organise itself as force and affirm itself as mode of production.

It is *here* that Deleuze returns to Marx, in occupying the same theoretical front and reuniting himself with the latter's revolutionary struggles that would construct an *other* social mechanism of production, a mechanism that works not for surplus-value but in *common*. The Marxian revolution is to have first announced that each historical formation is a disposition which results from a struggle. Each historical formation is the investment of an organised complex, stratified into multiple components, and to master adversarial forces is to reduce them to the matter and cogwheels of a mechanism of production. It causes changes there, that is to say, transformations.[12] The concept that opens the way for history in terms of revolutionary transformations is 'production'. These transformations have different modalities and directions, and Deleuze endeavours to map them out. Capital revolutionises the feudal regime by installing another system of production. Feudalism knocks down the domination of the *Urstaat*, just as it subdued the savage connections of production, by intertwining their pieces into an utterly different apparatus of subjugation. There is conflict everywhere because there is production everywhere. 'Production' – the connections, overlappings and disconnections which emerge – is the category which presents the possibility of accomplishing this recognition of history.

History is the battlefield of antagonistic productions, because everything is production:

> production is immediately consumption and a recording process (enregistrement), without any sort of mediation, and the recording process and consumption directly determine production, though they do so within the production process itself. Hence everything is production: production of

> productions... Everything is production, since the recording processes are immediately consumed, immediately consummated, and these consumptions directly produced. This is the first meaning of process as we use the term: incorporating recording and consumption within production itself, thus making them the productions of one and the same process. (Deleuze and Guattari 2000: 4)

The body of history is a laminating constellation of strata of production.[13] It is this articulated production, its syntheses and its effects of transformation, which are traced by genealogies divided between domination and flight. The modes of production function by connecting vanquished forces to engines which realise them. These vanquished forces are the materials with which the mode of production nourishes itself and reproduces its apparatuses.

The word 'being' no longer has any meaning.[14] It recalls the analogical reference which reduces the noisy motors of engines dispersed everywhere to dreary images, phantasms of signification. Force – immanence – domination – production, it is thanks to these concepts that conceptual machines are composed which break the cages constructed by the dialectic.

The only logic familiar to this strategic plan linked to conjunctures of war is that of change by subordination, or even the political enterprise which affirms the government of partial collective entities through other partial constellations. It is the same for the *Urstaat*. Never was a Deleuzian concept less understood. The *Urstaat* is not the model of an ideal type of State which is regularly represented throughout history. The *Urstaat* is an apparatus of coupling of a particular group of forces. These forces compose a determined social formation which, if it conforms politically to the formation of an *Urstaat*, in the process of work requires an ensemble of systems of material production and exchange – including the market – to work for its pre-eminence. The *Urstaat* is the notion with which it is possible to seize the State from myths of the social nature of man (i.e. from ideology), and from the natural disposition of social practices to organise themselves in a juridical apparatus. The State is also an effect, produced from the construction of a social body by packs which conquer a territory and assume for themselves the *right* to inscribe upon it their mark.

Once the State is made an object of production like the others, we can retrace the changes of the juridical processes – jurisprudence, which so fascinated Deleuze – of the various regimes. At this moment, the state formation established under capitalism loses its sacred allure. The differential specificity, related to conjuncture, of forms of the

State permit us to discover the content belonging to the capitalist state apparatus. It is no longer the needle which by itself guides all the members of society, similar to what happens under feudalism. Capitalism works through decoding. It must continually rework its objects in order to continue to obtain surplus-value from particular degrees of exploitation. Capitalism does not have the State at its centre because it is its own centre. It schizophrenizes in a ceaseless movement, incorporating everything it encounters, in changing its nature, modelling it and modelling itself – even in relation to its fundamental disposition. Capitalism must stratify itself in occupying the entire body of society. Marx understood this well (judging from embryonic bits of theory which he left behind), so much so that he posed the capitalist State in terms of a concrete category realised concretely from more abstract categories which maintain it as a subordinated element (Marx 1970).[15] The State becomes in a differential and stratified manner under the impulsion of the 'creative' evolutions of capital. The capitalist norm directly manages its world and projects it in productive flows, sliced-up strata which spring forth from its intentional tensions similar to anonymous and memory-less noematic nuclei.

We can thus appreciate the real value of minor flows, the schizophrenic lines traced by the subordinated which do not succeed in breaking free. They refuse the capitalist decoding and its law, and find therein not transgressions, regardless of secondary troubles, but the slices of an alternative social body, a completely other '*socius*'.

As Deleuze specifies, in the body of capital, which integrates everything through subjugation, there are never two classes, but one sole factory of reproduction of the capitalist axiomatic. The new full body which results from the inverted capital is neither a development nor the contrary of capitalism (which was called 'socialisation', especially 'by the State', of 'productive forces') but the last result of the intrinsic logic of accumulation. Socialisation resulted from the fictive opposition of two opposing poles, or classes, of a unique molar structure. As it happened, it only reproduced the totalitarian machine, inverted into the 'collective' form of State. A 'different' *socius* is made instead of forces which 'free themselves from this axiomatic just as they free themselves from the despotic signifier, that break through this wall, and this wall of a wall, and begin flowing on the full body without organs' (Deleuze and Guattari 2000: 255). They are machines which do not work towards despotism, but produce liberation in persistently conserving a 'minor' dimension, that is to say, in never totalising themselves in an attempt at ending conflicts.

Capitalist decoding flows are produced everywhere. They stock up on resources in order to direct themselves again and again at their subjects, swallowing them into one body, that of surplus-value. This action which unites force, organisation and efficiency also produces reactions. A logic of combat then imposes itself which gradually becomes explicit, on fronts in which are formed flows of singular machines of liberation that approach, as allies, all the other experiences which struggle against capital's domination of governed conjuncture. It is not said whether they will triumph in constructing other bodies, but under the pressure of domination, processes of work are set off which form machines of a completely different direction, architecture and function. The molar body that encloses flows in a despotic axiomatic is confronted by molecular actions which strike at the capitalist gears with weapons of a social disposition that already differ from their formation. This is the sole theoretical (and certainly political) criterion that may distinguish machines of liberation from machines of axiomatisation. This demolishing action occurs on all levels. There is a combat in work, just as there is a combat in signs. They are not similar, they do not even share modalities or movements. But they are all determining. Just as capital is extended over the totality of the social body, imposing its violence, various conflicts traverse it from one end to the other. Signs are also a battlefield, a matter of forces which confront each other in a struggle to affirm their own regime. The confrontations which *produce* the body of signs are also traced out on the cartography of conflicts. It is a true body, material as effectuated by relations between signifying elements which touch, connect with and detach from each other, and struggle. They are sensitive, and in this also find the reason for their proximity to the sensitive functions of the physical body. The struggle waged by the schizophrenic is just as central to the struggle in the factory, for the schizo is a constellation torn apart by a struggle which plays itself out at the level of signs. It involves reattaching, under the sign of production, the analysis of capitalism to that of schizophrenia in order to bring signs into the immanent domain of production and conflict. The forces of decoding allied to capital are found on this stratum as well. They have the name of Mommy and Daddy, and the factory in which they are formed is the family. These figures, as material as the materiality of capital's axiomatic, are active in the psychoanalyst's office. It is there that the ruptures provoked by the freeing of signifying elements irreducible to despotic signification are approached, discovered and again subjugated. However, the struggle does not end. The schizo continues to fabricate a new regime of signs, he turns to the factory

where sense is produced to carry it away from capital's totalising axiomatic. The schizo is in himself, in his very body, an advanced front, a field of signifying forces that command an irreducible chain of production.

The relations between the conflicts that tear apart the layers of the *socius* are subjugated to the evolution of the respective battlefields. They may construct reasons for alliances, confluences. Sometimes, they even work in parallel. They will however remain different. It is this very distinction which prevents their totalisation. This distinction becomes, if guided with strategic intelligence, either a guarantee, or an excellent weapon: it can obstruct the orders of the adversary, which is always a present risk. It strikes at his defences by continuing to break his totalising (molar) structures. The act of disjunction traverses these structures, through processes of singularisation. The despotic machine was knocked down by the fabrication of a social body which puts into practice the absolute democracy of a factory of scission, made of gears of liberation which work to open up new spaces to conflict and to ceaselessly deconstruct totalitarian superimposition.[16]

Thought is also brought back to unstable equilibria which create trembling in language, images and sounds, or the figural constellations of the unconscious. It is swept away by the scissions and overturned as much as these latter. It has no pre-eminence. Thought and foolishness are one, because ideas are partial elements produced by partial layers, parts of a divided social body, criss-crossed by the conflicts which work upon all the strata. Theory is a singular moment in a singular proliferation of struggles.[17] It must discover itself as *one* combat front and renounce its privileges. It is no longer the light which shines upon the learned, the rulers, on collective or organic intellectuals, inscribing upon them the marks of reason. It is a war machine, a combat apparatus which intervenes in the concept.

A theory which works scissions and is produced to liberate itself from the paranoiac discipline of capital is found in the wake of Marx. It shares trenches. It ceases thus to be the prophet who sanctifies the name of the father assigning the dignity of the son to his brothers, a privileged voice of the sovereign principle, the dialectic of productive forces and manager of its royal science. Marx is a celibate body. He is a toolbox and a revolutionary movement. Marx digs escape routes in theory, and delivers blows in the streets with the other comrades. How many people racked their brains (one thinks of certain 'all too human' Italian theorists, such as Della Volpe[18] or Luporini,[19] for example) over the question of 'fetishism', even of ideology, forgetting that it is only

comprehensible in relation to the function of thought in Marx, and thus to the war machine in the theory he assembles. The fetish is the military conquest of signs drafted by a despotic axiom, which struggles for and with capital. Furthermore, the analysis of the fetish has nothing to do with its substitution by another totalitarian truth. It is the flight which revives theory in flows of alternative production, the assault carried out upon a general domination which frees theory in order to bring about conflicts everywhere in the strata of signifying production. The Marxian theory of fetishism is analysis in so far as it is decomposition of a totalitarian abstraction which affirms one sole law upon all signs. Or rather, it is a force which strikes the despotic sign *par excellence*: money.[20] Marx, in attacking the fetish, had already moved elsewhere. Marxist theory became a plural body of alliances, a riot of singular war tactics against power and its machines of subjugation. Marx loses his identity and begins to open out in thousands of growths, in a proliferation of plural machines of liberation. We no longer encounter Marx in the stuffy atmosphere of identitary lineages, which are houses much too tight to give liberty its space. We meet him, with the intense joy of a liberty always to come, in traversing as nomads the capitalist city on our way to the desert where all encounters are possible, *producing* democracy without transcendence.

Notes

1. On this see also Delcò (1988).
2. 'The phenomenon appears in space and time: space and time are for us the forms of all possible appearing, the pure forms of our intuition or our sensibility. As such, they are in turn presentations; this time, *a priori* presentations' (Deleuze 1984: 8).
3. The important thing in representation is the prefix: *re*-presentation implies an active taking up of that which is presented; hence an activity and a unity distinct from the passivity and diversity which characterize sensibility as such' (Deleuze 1984: 8).
4. On this see also Fadini (1998) and Montebello (2008).

The Fetish is Always Actual, Revolution is Always Virtual: From Noology to Noopolitics

Jason Read University of Southern Maine

Abstract

By most accounts Deleuze's engagement with Marx begins with the two volumes of *Capitalism and Schizophrenia* he co-authored with Félix Guattari. However, Deleuze's *Difference and Repetition* alludes to a connection between Deleuze's critique of common sense and Marx's theory of fetishism, suggesting a connection between the critique of the image of thought and the critique of capital. By tracing this connection from its emergence in the early texts on noology, or the image of thought, to the development in the critique of state thought in *A Thousand Plateaus*, it can be argued that what initially appears as an entirely infra-philosophical problem, concerned with the presuppositions of philosophy, is not only a political problem as well, but ultimately bears on the very nature of the conjunction between thought and politics, making possible a re-examination of what is meant by revolutionary thought. It is a transition from noology to noopolitics. In the end it can be argued that revolutionary thought is no longer an eschatology, attempting to discern the signs of the future revolution in the present, but a thought oriented towards everything that exceeds the fetish of society, towards the virtual relations and micropolitical transformations that constitute society but exceed its representation.

Keywords: Commodity fetishism, ideology, labour, noology, virtual, and actual

The obvious starting point for any discussion of the relation between Marx and Deleuze would seem to be the two volumes of *Capitalism and Schizophrenia*, in which Marx's texts provide the backdrop for the conceptualisation of deterritorialisation, desiring-production and abstract machines. However, in *Difference and Repetition*, there are a

few references to Marx that, although disparate and oblique, suggest a fundamental overlap of central problems. As an initial point of provocation and orientation, we can begin with the following two statements: 'The natural object of social consciousness or common sense with regard to the recognition of value is the fetish'; and secondly, a few lines later: 'The transcendent object of the faculty of sociability is revolution' (Deleuze 1994: 208). In these passages we see two of the central terms that represent the alpha and omega of Marx's thought: fetishism and revolution; the first is synonymous with false consciousness, a fundamental misapprehension of the world, while the second is the overturning of that perspective and that world. The citation of these terms is situated within Deleuze's project of transforming the very image of thought, from one based on recognition and identity to a paradoxical thought of difference. Of course it is possible to argue that what links these two thinkers and problems is nothing but the contingent and superficial connection of a context: Marx was a central, even obligatory point of reference during the 1960s in France, and thus the invocation of his name is nothing more than the by-product of writing in a particular place and time. If one scratches beneath the surface, however, it is possible to see that this superficial pairing of problems indicates a much more significant intersection, one based on the fundamental problem of what could be called the politics of thought: a politics that examines how certain images of thought emerge from different social relations, and how they in turn affect these relations.

This problem takes on different forms, concepts and names in each thinker. For Deleuze, it emerges in *Difference and Repetition* as the problem of the dominant image of thought in philosophy, and continues through the collaborations with Guattari as noology, which they define as 'the study of the images of thought and their historicity' (Deleuze and Guattari 1987: 376). Deleuze's (and Guattari's) fundamental point is that despite philosophy's attempt to function without presuppositions, to engender itself through a fundamentally grounded and rational discourse, it always rests on an implicit idea of what it means to think, an image of thought. The problem of the politics of thought takes on a somewhat different form in Marx's writing, so much so that it might not even appear to be a problem that Marx's work addresses at all. However, as Marx and Engels argued in *The German Ideology*, the fundamental mistake of German Idealism, and thus to some extent all of philosophy, has been to overlook its connections with 'its material conditions.'[1] The central political and philosophical concepts of Marx's work – mode of production, ideology and commodity fetishism – all

address, in one form or another, the relation between thought and its conditions, conditions that are not conceptual, but material, the social conditions that are the constitutive outside for any philosophy, for any thought.

It might appear that in each case what is meant by presuppositions is fundamentally opposed. In the first case they are conceptual, the orientation and image that all thinking must assume; while in the second the presuppositions concern material conditions that by definition are lived rather than thought, reflected in Marx's fundamental assertion that '*Life is not determined by consciousness, but consciousness by life*' (Marx and Engels 1970: 47). My point is not that Deleuze and Marx are the same, rather it is the differences between the two – the former's focus on the preconceptual assumptions underlying conceptual thought and the latter's focus on the material conditions that make thought possible – that give shape and meaning to a fundamental philosophical problem. This fundamental problem is formed and transformed through Deleuze and Guattari's writings that continue to address this problem of the image of thought, from *Difference and Repetition* through the two volumes of *Capitalism and Schizophrenia*, a problem that remains strongly connected to the general problem of materiality and abstraction. As we will see, the vicissitudes of the problem are determined as much by extrinsic conditions – by the changing relationship between thought and labour in contemporary capitalism – as they are by intrinsic factors, or the development and revision of a line of thought. It is through tracing this connection between material conditions and conceptual presuppositions that we can arrive at a new definition of revolutionary thought; revolutionary thought is no longer an eschatology, attempting to discern the signs of the future revolution in the present, but a thought oriented towards everything that exceeds society as a fetish, exposing the virtual relations and micropolitical transformations that constitute a sociality that exceeds any delimited society.

I. Society is a Fetish

In developing his idea of the image of thought, Deleuze takes as his initial focus not ideology, but the fetish, or commodity fetishism. In the initial gloss of Marx and Deleuze, we have treated these two problems, ideology and commodity fetishism, as relatively interchangeable, turning to *The German Ideology* for a general definition of Marx's interrogation of thought. Deleuze's rejection of the term 'ideology' in the 1970s is well known; as made clear in a famous discussion with Michel Foucault,

the concept of ideology is rejected because of the manner in which it positions social relations, knowledge and the intellectual. Ideology presupposes both masses who are deceived and an intellectual who possesses the truth. For Deleuze the notion of ideology obscures the real problem, the investments and productions of desire (Deleuze and Foucault 2004: 212). This explains the rejection of ideology, but not the adoption of fetishism. An examination of the general contours of the problem of commodity fetishism alongside Deleuze's general project of *Difference and Repetition* begins to establish a deeper connection, one that has less to do with the polemics of the role of the intellectual and more to do with the problem of the relationship between thought and the social order.

On first glance the choice of commodity fetishism as a model for a critique of an image of thought seems like a strange move; ideology would seem to be the obvious position from which to interrogate the relationship between thought and its presuppositions. After all, in *The German Ideology*, ideology was just another name for (German) idealism, for a mode of thinking which, in ignoring its material conditions, not only fails to grasp the real basis of society, but is unaware of the way in which it serves class interests. In contrast to this, commodity fetishism would seem to be restricted to a much more specific problem, that of the epistemological status of political economy, and its understanding of value. This is the difference if we focus on the objects of Deleuze's and Marx's respective criticism, namely philosophy and political economy. A different picture emerges, however, if we examine the way in which each concept articulates the relationship between thought and its social presuppositions. While ideology, for Marx, is rooted in social conditions, such as the division between mental and manual labour and the consequent class divisions of capitalist society, there is no necessary relation between these conditions and either the form or the content of ideology. In other words, while there are material conditions that make each ideology the ruling ideas of the ruling class, namely ownership of the means of production, there is nothing to dictate the specific shape that ideology will take, what these ideas will be in each case. Thus, while it is possible that Marx meant to indict the pretensions of philosophy *tout court* with his critique of ideology, the term ideology is generally understood in the plural. There are various ideologies all of which have a merely extrinsic historical relationship to thought. The fetishisation of the commodity form, however, is a necessary appearance of capitalist social relations. This is why the chapter on commodity fetishism ends with a discussion of different

societies – Robinson Crusoe, medieval society and an 'association of free men' – because fetishism can only be overcome practically through a change in social relations (Marx 1976: 171). This is why the opposite of fetishism is not enlightenment but revolution. In capitalist society, the isolation of the different producers, the separation of private industry, makes it so that social relations appear in the form of the relation between things; the value of the various commodities, a quality that appears to be as real as their myriad qualities, is nothing other than the social relations of society in a distorted form. Two consequences follow from this; first, the emphasis is not on the content but on the form. Any attempt to develop a critique of philosophy from the commodity form would take as its starting point not a criticism of this or that content or concept, as in ideology critique, but would begin from a much more troubling problem regarding the social causes of what is seemingly most necessary and inescapable for thought, its form.[2] Second, given that the fetish is most fundamentally a misapprehension of social relations, seeing the social relations as the quality of things, the opposition is not simply between truth and falsity, but between a thought of difference and identity, of relations and things.[3] This is precisely what Deleuze stresses about commodity fetishism, as he writes: 'For example, according to Marx, fetishism is indeed an absurdity, an illusion of social consciousness, so long as we understand by this not a subjective illusion but an objective or transcendental illusion born out of the conditions of social consciousness in the course of its actualisation' (Deleuze 1994: 208). What is at stake for Deleuze in Marx's understanding of commodity fetishism is a new understanding of the limits of thought, not the empirical limits of error, or even the transcendental condition of illusions hard wired into subjectivity, but the socially produced limits that transform relations into objects.

To grasp Deleuze's understanding of fetishism, and how it relates to Deleuze and Guattari's later engagement with Marxism, it is necessary to at least briefly clarify the concepts that form the critical backdrop of *Difference and Repetition*, specifically the critique of common sense as an image of thought. For Deleuze common sense is a particular presupposition of thought, a presupposition that is not objective, not a particular concept or definition, but an implied meaning of what it means to think. What is presupposed is an ideal of representation that posits an identical object, a thing which remains fundamentally the same, and a unity of the subject, as the various faculties converge on the same object; it is the same thing, which is felt, seen and remembered by the same subject. Truth is recognition: error is misrecognition. Common

sense is dominated by recognition; to know is to recognise, to extract the same from the multiplicity of its instances. Against this Deleuze suggests a counter-image of thought based not on recognition, but on an encounter. 'Something in the world forces us to think. This something is an object not of recognition but of a fundamental encounter' (Deleuze 1994: 139). Whereas recognition is predicated on the convergence of the different faculties on the same object, the encounter, the break from common sense, is predicated on their fundamental discord. What is thought, sensed, or remembered, takes each of these faculties to its limit and does not communicate with the other faculties, except through a kind of crisis. This includes a sociability, which has its own disjoint relation to the faculties; it cannot be recognised, it is not an object for knowledge, it can only be lived. As Deleuze writes:

> Take the social multiplicity: it determines sociability as a faculty, but also the transcendent object of sociability which cannot be lived within actual societies in which the multiple is incarnated, but must be and can be lived only in the element of social upheaval (in other words, freedom, which is always hidden among the remains of an old order and the first fruits of a new). (Deleuze 1994: 193)

Common sense objectifies sociality, makes society a thing that can be seen, remembered and thought. To use a term that is not entirely out of place with Marx's understanding of commodity fetishism, common sense reifies sociability; it displaces the practice, the process of the constitution of social relations, with the product. In contrast to this, in moments of upheaval and disruption, there appears a sociality that exceeds any actually existing society, a virtual society that is always in excess of any existing social order. In Deleuze's thought, virtual does not mean possible (a concept that is always derived from reality, caught in a relation of identity), nor is it unreal: it is, as Deleuze writes, abstract and real. It is the fact that every society, every social articulation, can be realised otherwise, can have different relations, and is thus surrounded by a virtual cloud (Deleuze 1997: 148). At this point in *Difference and Repetition* this revolutionary idea, this idea of revolution, is only seen in the moment of disruption. It is thus no accident that in this text the transcendent object of sociability is named anarchy (Deleuze 1994: 143). In Deleuze's later writings with Guattari, the connection between this virtual sociability and the economy, or, more specifically, labour, will be strengthened. The transition from anarchy to labour is not just a matter of reviving some nineteenth-century debate between

anarchism and Marxism, but of shifting the focus from the virtual as a revolutionary moment to a persistent presence – an immanent condition.

II. Production/Representation

As Deleuze argues, the social idea, sociality as a virtual multiplicity, has to be seen as something of a structure, which different societies realise in myriad different ways. As Deleuze writes:

> The social Idea is the element of quantitability, qualitability, and potentiality of societies. It expresses a system of multiple ideal connections between differential elements: these include relations of production and property relations which are established not between concrete individuals but between atomic bearers of labour-power or representatives of property. The economic instance is constituted by such a social multiplicity – in other words, by the varieties of these differential relations. (Deleuze 1994: 186)

Deleuze's nod here is to Louis Althusser and Etienne Balibar's reading of Marx, which makes it possible to grasp history not as the teleological unfolding of a fundamental contradiction, making possible the periodisation of history, but as the differential actualisation of a system of relations. In Althusser and Balibar's view the 'mode of production' is most fundamentally a 'relation between relations' (Althusser and Balibar 1970: 224). This structure, or relation between relations, is made up of the different practices, economic, political, ideological, etc., that act on and in relation to each other. In this structure of relations, the economic remains determining, but it does not simply act on the other aspects of society, imposing its brute necessity; it acts on them by determining their differential relations, determining which of these relations, or practices, is dominant. The classic example of this is drawn from Marx's discussion of feudalism, in which Marx argues that in the Middle Ages religion was determined as dominant (Marx 1976: 176). The constituting relations can be articulated in multiple different ways, with different practices, economic, political or religious, occupying the dominant position, and different relations between these different instances. 'The economic instance is constituted by such a social multiplicity – in other words, by the varieties of these differential relations' (Deleuze 1994: 186). Such a conception of the economy breaks with any teleology, any sense of the different modes of production following each other in a linear progression, in order to stress their differential articulation. While Deleuze stresses the determining nature of the economy, its determination is that of a problem which

is solved in different ways, not that of historical necessity or a base. The truth of social relations is not to be found in some concrete instance, but in the relations between the different social relations, thus in abstraction, in the virtual.

Deleuze deviates from Althusser and Balibar in placing 'abstract labour' at the foundation of this differential relation. As Deleuze writes, 'In what Marx calls "abstract labour" abstraction is made from the particular qualities of the products of labour and the qualities of the labourers, but not from the conditions of productivity, the labour power and the means of labour in society' (Deleuze 1994: 186). Deleuze's definition stresses two aspects of Marx's concept that will become increasingly important to his later work: abstraction as indifference to subject and object, yet socially determined. In *Anti-Oedipus*, Deleuze and Guattari foreground Marx's discovery of abstract labour – or rather his crediting of Adam Smith and Ricardo for the discovery – in their development of desiring-production. As Deleuze and Guattari write:

> Marx said that Luther's merit was to have determined the essence of religion, no longer on the side of the object, but as an interior religiosity; that the merit of Adam Smith and Ricardo was to have determined the essence or nature of wealth no longer as an objective nature but as an abstract and deterritorialized subjective essence, the activity of production in general. (Deleuze and Guattari 1983: 270)

This is a fundamental example, if not the paradigmatic instance, of deterritorialisation. Whereas prior political economists had initially sought the origin of wealth in a privileged object, such as the earth, or in a particular kind of activity, such as agricultural labour, the political economy of Smith and Ricardo recognises that at the basis of wealth there is nothing other than labour as an abstract subjective activity. Deleuze and Guattari immediately assert that political economy no sooner discovers this abstract activity than it objectifies it, reterritorialising it by subordinating it to accumulated capital. Capitalism is thus the exemplary instance of Deleuze and Guattari's fundamental point: deterritorialisation is inseparable from reterritorialisation. This is how they introduce Marx's critique of political economy, as a critique that not only liberates abstract subjective activity from the territories of the earth, but also explores the way that this activity is appropriated by the territories of capital and the State.

Abstract labour, as Marx defines it in the opening section of *Capital*, is not only labour that is indifferent to, or abstracted from, its particular concrete mode of existence. It is also, and perhaps more

importantly, labour that has been rendered interchangeable, equivalent, despite the different individuals performing it. It is that invisible but not impalpable unit that makes exchange-value possible. Its invisibility outlines the fundamental problem of the question of value, and of commodity fetishism, in which the grounds for the equivalence of the various commodities is mysterious in theory because it is always already answered by practice. In practice, abstract labour is a socially necessary abstraction, an abstraction made possible by the machines and technologies that render different kinds of work interchangeable. It is felt as a practical reality whenever these social and technical realities change, whenever a new machine or new more efficient labour process is invented (Marx 1976: 135). As such, it arises only with the formation of capitalism. As Marx writes: 'the most general abstractions arise only in the midst of the richest possible concrete development' (Marx 1973: 104). It is only in capitalist society, with the rise of monetary relations and the breakdown of traditional jobs and activities, that something like 'labour' as an abstract activity emerges, displacing the concrete activities. However, as Marx famously argues, just as 'human anatomy contains a key to the anatomy of the ape', so it is from the perspective of this historically produced activity that we are able to make sense of other societies as determined by modes of production, as based on the articulation, distribution and use of labour. This is precisely the position taken by Deleuze and Guattari with respect to abstract subjective activity, or what they call desiring-production: it emerges at the end of history, in the breakdown of codes and the general imperative to produce, but it makes possible an understanding of other societies, precisely in the manner in which they code or repel desiring-production. The most fundamental abstractions, abstract labour or desiring-production, are not found at the beginning of society, in some primitive state, but in the most complex societies.

Returning to the passages above from *Difference and Repetition*, viewed now through their development in *Anti-Oedipus*, we can see that in the former text Deleuze draws together two very different strains of Marxist thought. The first, which posits the economy as a series of differential relations, is drawn from Althusser and Balibar, while the second, focusing on abstract labour, does not seem to have a specific point of influence aside from Marx, but has resonances with the idea of 'real abstraction' developed in different senses by Alfred Sohn-Rethel, Moishe Postone and Paolo Virno. These two lines of thought continue through Deleuze and Guattari's works: the first, with its emphasis on relations, forms the basis of concepts such as that of abstract machines,

while the second underlies their conception of desiring-production. Where these two lines of thought converge is in their refiguring of the notion of abstraction: abstraction is no longer an activity of thought, but the product of material relations, relations that remain in some sense unrepresentable. This claim is in some sense already indebted to Marx's understanding of his own critical project, which paradoxically focuses on the status of the abstract concepts of 'abstract labour' and 'surplus value' (Althusser and Balibar 1970: 80). It is only from the perspective of the critique of capitalism that labour can appear as both absolutely necessary, as part of man's metabolic interrelation with nature, and as fundamentally abstract, as an indifference to its specific object or subject. This indifference must be actualised, it must take the form of a particular kind of work, of labour. This necessary abstraction can only appear in particular concrete formulations. From this we can better grasp Deleuze's earlier assertion, in *Difference and Repetition*, that 'there are only economic social problems' (Deleuze 1994: 186). The economy is both absolutely necessary, something that meets the most fundamental needs of existence, and fundamentally abstract, made up of only the differential relation between the various practices, and structures, which become concrete only in their reciprocal relations. It is the problem that every society faces, but a problem that can only be resolved in specific articulations, in specific social formations. The economy, understood as the articulation of abstractive subjective activity, of any-activity-whatsoever, is something that exists only in its particular articulations, as specific concrete realisations of this virtual set of relations. Deterritorialisation is inseparable from reterritorialisation.

In *Anti-Oedipus* the critique of recognition, of identity in thought, is resituated from a critique of an image of thought to an opposition between production and representation. Much of this takes a polemical tone, in which the theatre of Oedipus is opposed to the factory of the unconscious, the work of the desiring-machines. However, it also extends and deepens the idea of fetishism. As Deleuze and Guattari write:

> Let us remember once again one of Marx's caveats: we cannot tell from the mere taste of the wheat who grew it; the product gives us no hint as to the system and relations of production. The product appears to be all the more specific, incredibly specific and readily describable, the more closely the theoretician relates it to *ideal forms of causation, comprehension, or expression*, rather than to *the real process of production on which it depends*. (Deleuze and Guattari 1983: 24)

Just as products, commodities, obscure the process of their production, so institutions, structures, society itself, obscure the virtual relations that constitute them; the solution conceals the problem from which it emerged. In *Anti-Oedipus* Deleuze and Guattari expand upon and develop this idea of the fetish from *Difference and Repetition*: the fetish becomes the socius. It is not just that the product, society, obscures the productive relations that generate it, it actively appropriates them. As Deleuze and Guattari write:

> the forms of social production, like those of desiring-production, involve an unengendered nonproductive attitude, an element of anti-production coupled with the process, a full body that functions as a *socius*. This socius may be the body of the earth, that of the tyrant, or capital. This is the body that Marx is referring to when he says that it is not the product of labour, but rather appears as its natural or divine presupposition. In fact, it does not restrict itself merely to opposing productive forces in and of themselves. It falls back on [*il se rabat sur*] all production, constituting a surface over which the forces and agents of production are distributed, thereby appropriating for itself all surplus production and arrogating to itself both the whole and the parts of the process, which now seem to emanate from it as a quasi-cause. (Deleuze and Guattari 1983: 10)

Just as the despot appears to be the cause and not the effect of subjection, capital appears to be the cause and not the effect of labour. Once disconnected from the conditions of production, from the virtual relations that make it possible, society, the socius, not only appears to be autonomous, in the form of money making money, but is an effect that appears as a cause. Society not only appears to exist prior to the differential relations, the production and desire that constitute it, it also appears to stand above these relations as their necessary condition.[4] The fetish has become common sense in that we see society, with its structures, rules and goals, as something that exists prior to and is constitutive of the social relations of desire, perception and production.

III. The Return to Noopolitics: The Problem of State Thought

Following the line of noology, of the politics of thought, from *Difference and Repetition* to *Anti-Oedipus*, leads to a rather strange deepening of the problem. In *Difference and Repetition* the criticism was focused on a particular 'image of thought,' one that takes recognition as the fundamental function of thought. At the social level, this object of recognition, this identity between past, present and future, is in some sense society as a fetish. Against this, Deleuze focused on the

transcendent object of thought, on the abstract and differential relations that exceed any faculty of thought, any possible conceptualisation. The difference still passed within thought, opposing the provocations of thought to common sense. In *Anti-Oedipus*, however, the opposition shifts; it is no longer between different figures of thought, but between representation and the forces of production that exceed representation. The fundamental opposition is between how social relations are produced and how they are represented: or, as Deleuze and Guattari put it, how desire is produced and how it is recorded. It is for this reason that the image of thought, or what Deleuze and Guattari call noology, disappears from *Anti-Oedipus*. The entire problem of the image of thought disappears, to be replaced with the stark opposition between representation and production.[5]

Of the many shifts of terminology, content and style that characterise the transition from *Anti-Oedipus* to *A Thousand Plateaus*, two are relevant for our project here: the first, as I have already acknowledged, is the return of noology, the image of thought as a problem, and the second is the disappearance of labour, or rather production, as that which exceeds representation. It might be more accurate to state that it is the polemical rift between production, or labour, and representation, or thought, that disappears in the later text; when labour does appear, it appears not as an absolute rupture with the logic of representation, but as a figure of capture and subjection. Taken together these two changes suggest a fundamental transformation of the opposition that characterised *Anti-Oedipus*, that of thought and production. Production is no longer the absolute outside of representation, nor is thought reduced to a representation that can never intersect with production: thought is no longer limited to the fetish of common sense – to tasting the wheat without ever grasping how it has been produced – but is itself a productive force. Thought and production become tied to the same relations of deterritorialisation and capture.

If we turn our attention briefly back to *Anti-Oedipus* we can see that the issue of labour was never quite as simple as it might first appear, that the transformation of the question of production was already indicated by tensions within that text. As much as Deleuze and Guattari based their concept of abstract subjective activity, or 'desiring-production', on abstract labour, this understanding was perhaps always skewed with respect to Marx's text. (One of the strangest elements of Deleuze and Guattari's text is that in referring to Marx's understanding of the break represented by Smith and Ricardo, they frequently cite Foucault's *The Order of Things*, locating in that text an epochal

distinction between a classical age of representation and a modern age of production). For Marx, abstract labour is the condition of possibility of exchange, of the exchange that makes capital possible; thus it is first and foremost an equivalence established between different types of concrete labour. Marx vacillates somewhat on the ground of this equivalence, sometimes attributing it to an anthropological constant, and at other times attributing it to the machines and techniques that render labour equivalent and exchangeable (see Read 2003: 74). Deleuze and Guattari do not recognise the existence of anything like an anthropological constant underlying abstract labour, arguing that any idea of a standard amount of labour is itself the product of an arbitrary imposition. What Deleuze and Guattari focus on is not the equivalence underlying abstract labour, the fact that the labour of one person is equal to that of others, but its abstraction, or, more properly, deterritorialisation, its indifference to object or subject. It is perhaps for this reason that in *Anti-Oedipus* Deleuze and Guattari also consider the role of machines, actual machines, in the production of surplus-value. If labour can be abstracted from particular forms of subjectivity, from the blacksmith or shoemaker as a particular kind of labourer, and from particular objects, from the land or industry, then why cannot it also be abstracted from humanity, from human hands and minds altogether? Abstract labour becomes part of the machine; not just in the sense that Marx might have argued, in which the pure motor force of the body is replaced by the machine, but in the sense that abstract subjective activity, including that of knowledge, can become part of the machine. As Deleuze and Guattari write: 'Knowledge, information, and specialized education are just as much parts of capital ("knowledge capital") as is the most elementary labour of the worker' (Deleuze and Guattari 1983: 234). Machinery has a fundamentally different role to play in each account: in Marx's account the machine internalises the skills and knowledge of the worker, leaving behind a residue of labour that is fundamentally abstract in that it can be performed by anyone, while in Deleuze and Guattari's understanding, the abstraction of subjectivity crosses the divide between machine and human, constituting and exceeding both. In the first instance the machine makes abstract labour possible, as form of completely exchangeable human activity, while, in the second, the machine embodies abstract labour.

It is at this point that we can see the gulf separating Marx's understanding of abstract labour from Deleuze and Guattari. For Marx, abstract labour is first and foremost an equivalent, it is what makes possible the exchange of the labour of one for others, while for

Deleuze and Guattari abstract labour is primarily defined as a flow, as something separate from specific bodies and objects, the equivalent of which can only be the effect of a seizure by force. This last point is crucial, while Marx had always excavated the asymmetries of force underlying the equivalents of exchange, Deleuze and Guattari radicalise this point through their understanding of the primacy of difference over identity. In a seminar in the 1970s, Deleuze makes a distinction been an arithmetical and a differential understanding of surplus-value.[6] In the first, the quantifiable nature of labour is given, or assumed, and the only difference is a quantitative one between the wage (necessary labour) and profit. In the second, differential understanding, there is no equivalence, just an encounter between a flow of labour and a flow of wages. There is no ground for the exchange between labour and capital, the very terms of the exchange are constituted by the relation. The scandal of exploitation is not that labour is paid for at an insufficient rate, but that it is paid for at all: that a unit of money becomes equivalent to a unit of labour time (Deleuze and Guattari 1983: 249). This differential understanding also makes possible a theory of scientific or technical labour. Just as there is an encounter between a flow of labour and a flow of money, there is an encounter between a flow of money and a flow of knowledge. As Deleuze and Guattari argue, technological innovations are only introduced if they can increase surplus-value. Technological innovations are dependent upon a flow of money for their realisation. This is dependent upon multiple factors, such as scale of production and cost of labour, factors that make possible an incredibly uneven development of technology and social relations (Deleuze and Guattari 1983: 233). As with *Difference and Repetition*, society only exists as a set of differential relations between different flows: money, labour and knowledge.

In *A Thousand Plateaus*, Deleuze and Guattari repeat their earlier formulation that presents capitalism as formed in the encounter between an unqualified activity, any activity whatsoever, and an unspecified object, any object whatsoever (Deleuze and Guattari 1987: 453). However, at this point, production, labour, is no longer presented as the paradigmatic instance of deterritorialised subjective activity; rather, it is integral to the manner through which this activity is seized by force, it is an apparatus of capture. The model of abstract subjective activity is no longer abstract labour, but free action: the figure of this abstract subjective activity is no longer the 'schizo', the factory of desiring-production, but the nomad and its war machine. This radical break at the level of names and figures risks concealing what is in many

respects a continuation at the level of concepts and problems. As we have seen, when Deleuze and Guattari invoke abstract labour in *Anti-Oedipus*, it is never the quantifiable abstraction that is stressed, the capacity of rendering labour exchangeable and interchangeable, but its qualitative indifference to subjects and objects. In *A Thousand Plateaus*, it is precisely this capacity to render different activities comparable that is identified with the 'apparatus of capture'. Activity, free activity, is captured by being rendered comparable with other activities, by being subject to an abstract standard that defines it as work, a standard that is always inseparable from a surplus. The encounter between the two flows, money and labour, is always asymmetrical, with the first setting the terms of the relation. Surplus labour is not the simple quantitative difference of labour above and beyond what is necessary to survive, but the foundational excess that determines the terms of the equation. 'Surplus labour is not that which exceeds labour; on the contrary, labour is that which is subtracted from surplus labour and presupposes it' (Deleuze and Guattari 1987: 441). Labour does not exist as a generic human capacity, but is constituted by the very act that exploits it, that constitutes a surplus. As Deleuze and Guattari write:

> Impose the Work-model upon every activity, translate every act into possible or virtual work, discipline free action, or else (which amounts to the same thing) relegate it to 'leisure,' which exists only by reference to work. We now understand why the Work-model, in both its physical and social aspects, is a fundamental part of the state apparatus. (Deleuze and Guattari 1987: 490)

As the passage indicates, one of the fundamental roles of the State is to create work as the standard for the comparison of different activities. What is excluded from this, what cannot be measured or exchanged, becomes unproductive labour, leisure. In something of a reversal of classic Marxist theory, Deleuze and Guattari argue that the State as central force of command must be prior to the economy as an organised set of relations between disparate human endeavours. 'It is not the state that presupposes a mode of production; quite the opposite, it is the state that makes production a mode' (Deleuze and Guattari 1987: 429). Moreover, in attributing this process to the State, rather than the market, Deleuze and Guattari begin to suggest that the two problems addressed above, the return of noology and the changing status of labour, are in some sense related. The State is not just the name of the relations of force that make possible the equivalence underlying the exchange of different labours (and the commodities and surplus produced by this exchange), it is simultaneously a model of thought. It is a model of

thought that obscures the groundless nature of the differential relations between labour and capital, effacing the asymmetry of force with the neutrality of law – State violence is inseparable from its justification. This justification is not based on some specific narrative, some specific conceptual content, that would make the State reasonable, but on an identification of the State with reason itself.

The critique of state thought develops from the critique of common sense; in each case it is a matter of a presupposed unity, 'what everyone knows', but in the case of the State, this unity is elevated to universality. As Deleuze and Guattari write:

> The classical image of thought, and the striating of mental space it effects, aspires to universality. It in effect operates with two 'universals,' the Whole as the final ground of being or all-encompassing horizon, and the Subject as the principle that converts being into being-for-us. Imperium and republic. (Deleuze and Guattari 1987: 379)

What is striking about this passage is that the identification of the State as functioning with two universals, the 'whole' and the 'subject,' is very close to the general formula that Deleuze and Guattari use to identify capital: the encounter between an unqualified subjective activity and an unspecified object. Both capital and the State, or at least state thought, function in relation to an object and a subject that is in each case generic and universal. The crucial difference would seem to be that capital deals with differential relations between abstract activities and objects, while the State presents these abstract relations as equivalent, fundamentally overcoding the differential relations with an image of legitimacy. Capital is founded on the encounter between two flows, an asymmetrical, contingent and groundless encounter, that the State renders legitimate by presenting the terms – money and labour or worker and capitalist – as interchangeable. For the State the difference of class, of being a worker or capitalist, is irrelevant, they are equally subjects, motivated to exchange by interest and dwelling in 'the Eden of the innate rights of man' (Marx 1976: 280). As Deleuze and Guattari argue, the interiority of state thought is primarily a relation of identity between capitalist and worker, or ruler and ruled, positing a common ground of reason amongst different subjects. 'The state must realize the distinction between legislator and the subject under formal conditions permitting thought, for its part, to conceptualize their identity' (Deleuze and Guattari 1987: 376). Deleuze and Guattari's criticism of capital and the State risks collapsing the distinction, not just to the point where the two are identified, capital and the State as both figures of universality

and abstraction, but to the point where the opposition is reduced to a simple binary of the State versus nomadism (or, in *Anti-Oedipus*, fascism versus the schizo).

Despite the tendency to present the conflict between the State and the nomad as timeless, or at least metahistorical, Deleuze and Guattari fundamentally change the terms of the conflict by shifting it from philosophy – in which it was between the long line of state thought, stretching from Descartes to Hegel, and nomadic thought – to science. As Deleuze and Guattari argue, state science is primarily hylemorphic, working with form and content, and privileging formed and fixed bodies. 'Nomadic science', however, works with movements, with singularities: the events through which qualitative transformations take place (Deleuze and Guattari 1987: 372). The opposition between these two forms of science is only apparent: state science constantly needs the discoveries of nomadic science. The fluctuations of nomadic science thus are reterritorialised onto the fixed coordinates and categories of state science. Two things can be said about this concept of science. First, it reiterates a theme that is central to *Anti-Oedipus*, in which knowledge is presented as a deterritorialising/deterritorialised force. Second, the situation is parallel to that of labour, which is deterritorialised only to be reterritorialised onto property and capital. The deterritorialisations of nomadic science are integral to state science, even as they are subordinated to measures and concepts that are alien to them. The idea of nomadic science allows Deleuze and Guattari to make a point they could not make with respect to the history of philosophy: state thought is dependent on nomadic thought, difference is prior to identity, deterritorialisation is primary to reterritorialisation. For Deleuze and Guattari, knowledge and labour, thought and action, are subject to the same apparatus of capture, the same process of homogenisation and standardisation that constitutes quantitatively exchangeable units from differential relations of desire and action. In *A Thousand Plateaus* there is no longer a division between representation and production, or thought and action, each have their deterritorialised dimension, nomadic science and free activity, and are thus subject to similar apparatuses of capture. This similarity does not close the question of the relation of consciousness to life, but opens it to its historicity.

IV. From Production to Invention: The Problem of Noopolitics

Of the many readers of and commentators on Deleuze and Guattari's works, the Italian reception, specifically that of Antonio Negri and

Maurizio Lazzarato, is unique in that it stresses the historical dimension of their writing. To begin with, Negri's understanding of this dimension is not the simple assertion that their work represents an example of 'May '68' thought, of that bygone moment of exuberance and revolutionary excess. Rather, for Negri specifically, what is central is precisely what we are examining here: the changing structure of labour and its relation to the problem of thought. Negri argues that the machines that populate *Anti-Oedipus* are not metaphors, but attempts to grasp the complexity of the interactions of humanity and the machine that make up contemporary capitalism. The same could be said for the assemblages and machines that make up *A Thousand Plateaus* (Negri 1995: 104). What Negri's reading underscores, often overlooked by many other readers, is that it is not simply because of theoretical sophistication that we do not accept a dualism between representation and production, but because such dualisms no longer fit the current reality, in which representations are themselves productive. The schema of labour, action and intellect, first articulated by Aristotle and placed on modern footing by Hannah Arendt, is itself out of touch with a reality in which knowledge is productive and the uncertainty and plurality of action has become part of the service industry.[7] Thus, the shift of philosophical positions regarding the relation of labour, subjectivity and thought from *Anti-Oedipus* to *A Thousand Plateaus* is itself a product of the transformation of capital.

Negri's reading opens, or, rather calls to attention to, a different way of approaching the relationship between Marx (or Marxist problematics) and Deleuze and Guattari. It is no longer simply a matter of the way in which particular problems from Marx and Marxists inform Deleuze's writing, providing the basis for understanding society as a fetish, but the way in which Deleuze and Guattari's writing provokes and continues a re-examination of Marx's concepts. Or more to the point, since such a division is artificial, what is important is the way in which the central problems and concerns of Marxist thought, including that of the redefinition of labour in light of the contemporary transformations of capital, are integral to Deleuze and Guattari's understanding: just as Deleuze and Guattari's concepts of deterritorialisation, noology and the virtual make possible a re-examination of Marx's thought.

Of all of the post-autonomist thinkers who have followed Negri in reading Deleuze and Guattari as thinkers of the present, the one who is perhaps most interesting or relevant to our concerns is Maurizio Lazzarato. Lazzarato's central project turns on rethinking the current

conjuncture from the perspective of both noology, the image of thought, and an examination of the intersection of abstract subjective activity and labour. Lazzarato takes as his starting point what Deleuze and Guattari define as the foundation of capital, the encounter between a generic subject, of any subjective activity whatever, and an unspecified object (Lazzarato 2004: 13). Picking up on Deleuze and Guattari's emphasis on deterritorialisation, on the abstraction from specific activities and objects, Lazzarato opens the question of the adequacy of thinking this abstract activity through the figure of work (Lazzarato 2004: 13). As much as Marx may ground his understanding of capital on an abstract subjective activity, labour, that works on any object whatsoever, the commodity, he still primarily thinks of this relation as the action of a subject on an object producing a product through the medium of a tool (Marx 1976: 284). While we might add, in good dialectical fashion, that this action in turn transforms the subject, the fundamental question remains as to whether or not this schema of activity can account for contemporary relations of production in which work is not so much about transforming objects as it is about transforming perspectives, desires and relations. Thus, for Lazzarato, Marx's perspective is limited on two counts: first, in that it takes as its general schema of labour the idea of a subject transforming an object, and second, in that it understands this activity to be an abstract and interchangeable activity, positing subjects who interact only through the ground of this generic activity (Lazzarato 2002: 25). What is excluded in each case is difference, difference that is neither quantitative nor subject to the measure of labour time. The question is one of subjectivity, subjectivity not simply defined as the capacity to transform an object, but understood as temporality, invention and relation (Lazzarato 2004: 144).

For Lazzarato, the thinker who provides the true basis of an understanding of the abstract subjective activity underlying capital is not Marx but Gabriel Tarde, who tried to understand subjectivity as a relation of invention, imitation and competition (Lazzarato 2002: 39). Lazzarato uses Tarde's re-examination of the sociality of subjectivity to redefine labour, or replace it with the idea of 'action at a distance', of minds affecting minds, and to return to the problem noology, or rather, noopolitics. Noopolitics is defined as the action of minds on minds, of subjectivities acting on each other at a distance, affecting memory, desires and attention (Lazzarato 2004: 85). Despite the terminological similarity with Deleuze and Guattari's study of the images of thought, the 'nous' that underlies noology and noopolitics, Lazzarato's point of reference is less *A Thousand Plateaus*, with its battle between

state thought and nomadic thought, than Deleuze's 'Postscript on Control Societies', with its emphasis on forms of control that do not so much operate on the body, but on the mind, through the new technologies of communication (Deleuze 1995: 181). Lazzarato places Tarde's interest in the public, and the forms of media that were emerging in the nineteenth century, in a trajectory (borrowed from Foucault and Deleuze) in which power operates less and less on the flesh of the body, as in sovereign power, and more and more on perceptions, affections and memories. Modern technologies such as the television, cinema and the internet operate on minds; they are apparatuses of capture, capturing attention, memory and imagination. Before products can be sold, or even made, attention and memory must be captured by the technologies that work on publics (Lazzarato 2004: 117). The emphasis is on a new form of capital that works more on memory (think of the various cinematic remakes that are nothing more than attempts to mine a reservoir of nostalgia), belief and attention than on the production of things. This action in which the mind acts on the mind, on thoughts, defines a new political or social relation: if the age of abstract labour corresponded to the political regime of discipline, which made disparate bodies and actions abstract and interchangeable, the age of highly deterritorialised labour corresponds to actions on disparate minds, memories and perceptions. As Lazzarato writes: 'Noopolitics is exercised on the head, implicating attention in order to control the virtual power of memory. The modulation of memory would thus be the most important function of noopolitics' (Lazzarato 2004: 85). However, it should be noted, especially in the face of the many arguments levelled against epochal understandings of contemporary capital, in which the new is posited as a complete break with the past, immaterial labour replacing material labour, that Lazzarato's interest in Tarde is less about a transformation of the economy than a different understanding of the relationship between subjectivity and the economy. For Tarde, both Marxism and theories of marginal utility overlook the constitutive role of memory and desire in forming markets. Tarde's *La Psychologie Economique* argues that the 'economy', in the sense of the production and circulation of goods, is itself embedded in a larger economy, or circulation, of beliefs and desires that determines it (Lazzarato 2002: 28). Not only is there no separation between representation and production, belief and labour – the former is the ground of the latter. The immaterial, the virtual, becomes central to production, as goods and finance are increasingly dependent on the relations of belief.

As much as Lazzarato's argument can be understood as posed against the Marxist idea of labour, especially against the gulf that separates production from representation, it is an argument that returns us to the identification of the economy and the virtual in *Difference and Repetition* (as well as the productive power of desire in *Anti-Oedipus*). Lazzarato argues that the dialectic of subject and object needs to be replaced by the relation of event and worlds. Capital is not simply the work of an abstract subject on an undetermined object, it is inseparable from the production of new worlds, new senses of possibility, belonging, and orientations of affects. Every product, every enterprise, entails not just the actualisation of particular material and technological possibilities, but the actualisation of particular subjective possibilities, ways of thinking and seeing. As Lazzarato writes, 'Capitalism is not a mode [mode] of production it is a production of worlds [mondes]' (Lazzarato 2004: 96). These worlds emerge from the virtual relations of belief and desire that define a particular sense of the possible. This is not only true of consumption in which every product is inseparable from its lifestyle, its habits and desire, but it also effects finance capital, in which corporations are valued primarily in terms of the level of expectations and belief (Lazzarato 2004: 112). The stock market is also immersed in a field of beliefs and desires that constitute the basis for value. This process of production and effectuation, or in Tarde's terms, invention and imitation, takes place through activity, activity understood broadly to include the actions that disseminate beliefs, ideas and knowledge, activities that involve labour but exceed it. The two points of Deleuze's reading of Marx in *Difference and Repetition*, the economy as the articulation of differential relations and abstract labour, ultimately converge: the differential relations constitutive of society are actualised through abstract subjective activity.

V. Becoming Revolutionary Without the Revolution

In *Difference and Repetition*, Deleuze argues that different societies can be understood as the actualisation, which is to say the solution, of a general problem that can be called, for lack of a better word, economic. The solution actualises one of a virtual multiplicity of relations, and in doing so obscures the problem from which it emerges. In *Anti-Oedipus*, this general problem takes on the specific form of the relation between desiring-production and social production; every society, every form of social production is nothing but a specific organisation and

articulation of desiring-production, assigning it specific goals and aims. This task is in part completed by a representation of society itself, by the socius that presents society, in the form of the despot or capital, as something that exists prior to the various actions that constitute it. In *A Thousand Plateaus*, noology, the image of thought, returns; now it is situated within the conflict between the State and the nomad. This conflict between the images of thought is a conflict between a mode of thought that privileges fixed forms and stable movements versus 'thought without an image' that is founded upon difference and events. The differential relation of forces that constitutes capital is obscured by state thought which deals only with equal and interchangeable subjects. At this point, however, the relation is less an opposition than a process by which the former is continually captured by the latter. State thought requires the deterritorialisation of nomad thought, just as capital requires labour. What this trajectory underscores is not just the virtual differential relations underlying any delimited society, that every society is the realisation and limitation of various social possibilities, but that these different relations are produced and actualised by abstract subjective activity.

Deleuze and Guattari thus offer a more radical, or at least more interesting, understanding of the phrase 'there is no such thing as society' than the one made famous by Margaret Thatcher: society is a fetish (albeit one with incredibly pervasive effects), but what it misrepresents is not some underlying reality of 'individuals and families' but an abstract subjective activity, which is another way of saying that what is real is the indetermination and transformative nature of activity itself. Deleuze and Guattari rearticulate a different link between labour and revolutionary consciousness than the one that has traditionally held sway in Marxism. It is not a matter of a dialectical negation, or a historical telos, of labour-power taking the subjective form of the proletariat as that class with nothing to lose but its chains. Production in Deleuze and Guattari is not the act of a subject at all, it is an abstract subjective activity, an activity that exceeds subjectivity and constitutes it. It even exceeds any attempt to delimit it to a specific type of activity, to designate it as labour. As Deleuze and Guattari argue, capitalism entails a fundamental, almost ontological transformation of what constitutes subjectivity and objectivity: an unqualified and global subjectivity encounters an unspecified object, or, in more conventional terms, labour-power confronts the commodity. The connection between this activity and revolution does not pass through a subject of history, but rather passes through the relationship between the virtual and

the actual, the creative activity constitutive of society and its actual articulation and concealment within a specific society.

This activity does not just produce the actual world, but, as Lazzarato argues, the possible world as well, producing the halo of the virtual that accompanies the actual. To become revolutionary is to grasp this potential underlying the present, the virtual underlying the actual. The virtual is always already present in every labour, in every action. Politics is no longer a struggle over this world, even of its contradictions, but a production of new worlds. Another world is always possible.

Notes

1. Pierre Macherey underscores this dimension of *The German Ideology*, writing the following: 'Hence this notion that Marxism was the first to explore: philosophy is not an independent speculative activity, as would be a pure speculation, but is tied to "real" conditions, which are its historical conditions; and this is why, let it be said in passing, there is a history of philosophy, which can be retraced and understood' (Macherey 1998: 9).
2. In this manner Deleuze's comparison of the form of thought with the commodity form, a form that privileges identity over difference, is similar to Theodor Adorno's critique in *Negative Dialectics*.
3. John Holloway, following Lukács, Adorno and Negri, has generalised this idea of fetishisation in terms of a rift between the doing and done, subject and object, difference and identity. His understanding, like Adorno's cited above, is not unrelated to the intersection of Deleuze and Marx (see Holloway 2005).
4. Once again the point of reference would seem to be Althusser and Balibar's *Reading Capital*. In that text Althusser refers to the 'society effect' as the way in which the different and differential practices of society hold together through a form of subjection. As Althusser writes: 'The mechanism of the production of this "society effect" is only complete when all the effects of the mechanism have been expounded, down to the point where they are produced in the form of the very effects that constitute the concrete, conscious or unconscious relation of the individuals to the society as a society, i.e., down to the effects of the fetishism of ideology (or "forms of social consciousness" – *Preface* to *A Contribution*...), in which men consciously or unconsciously live their lives, their projects, their actions, their attitudes and their functions as *social*' (Althusser and Balibar 1970: 66).
5. Etienne Balibar has offered an interpretation of the limitations of *The German Ideology* that is relevant here. As Balibar argues, the strong identification of idealism, ideology and domination has as its corollary an identification of matter, production and liberation in the body of the proletariat (Balibar 1994: 93). Put simply, in Marx's text the proletariat has no ideology, no theory, as Marx argues, its theoretical illusions have been dissolved by the pure force of history.
6. The lecture, dated 12/21/71, is available here: www.webdeleuze.com/php/index.html
7. This argument regarding the breakdown of the classic schema of labour (or poesis), action (or praxis) and thought (or theoria) is given its most concise formulation in the work of Paolo Virno (see Virno 2004: 51).

Minor Marxism: An Approach to a New Political Praxis

Eduardo Pellejero Universidade Nova de Lisboa

Translated by Pauly Ellen Bothe and Davide Scarso

Abstract

In 1990, Antonio Negri pointed out some problems with Deleuze's political philosophy. Substituting infra-structures for life or desire, as constitutive dimensions of power formations, did not imply giving up on Marx, but it certainly did imply a change in the table of conceptual analysis and a profound renovation of the questions that pertain to militant praxis. Taking this into account, we intend to explore the sense of a rare fidelity to Marx, and a certain idea of intellectual commitment that, reframing its objects and its instruments, pretends to renew political thinking in order to confront the unforeseeable of new knowledge, new techniques and new political facts.

Keywords: Minor-dialectic, becoming-revolutionary, creation of assemblages, de-totalisation, ethics of struggle

In 1990, in an interview conducted by Toni Negri for the magazine *Futur antérieur*, Deleuze defended his fidelity to Marxism, that is, the idea that political philosophy finds its fate in the analysis and criticism of capitalism as an immanent system that constantly moves its limits and constantly re-establishes them on an expanded scale (Capital being itself the very limit). Furthermore, he also defended a re-evaluation of its objects and its instruments along the lines of a differential typology of macro and micro-assemblages as determinants of social life (Deleuze 1990: 229–39).

Substituting infra-structures for life or desire, as constitutive dimensions of power formations, did not imply giving up on Marx, if, as Derrida suggests, Marx had already alerted us to the historicity and the possible aging of his work; that is, to the necessity of *transforming* his own thesis to confront the unpredictability of new knowledge, new

techniques, new political data (Derrida 1993: 35). On the other hand, it did imply the problem of the type of struggle that such a shift in the theory could produce at the level of praxis. Lines of flight (rather than social contradictions), minorities (instead of classes), and war machines (against the State apparatus) did not entail a change in the conceptual framework of the analysis without requiring, at the same time, a profound renewal of the issues that shape militant praxis.

And that renovation was imperative once we recognise that the analysis of society in terms of assemblages of desire – the concept that Deleuze prefers over Foucault's concept of *dispositifs* (deployments or devices) of power – implied a break with any logic of progress or libertarian teleology. In fact, from sovereign societies to disciplinary societies, and from disciplinary societies to control societies, the adjustment of collective assemblages is the expression of a change, but not necessarily a change for the better:

> It is possible that the hardest confinements may come to seem part of a happy benevolent past, taking into account the forms of control in open spaces that emerge... liberations as submissions have to be confronted one by one in its own way.... There is no place for fear, neither for hope, it is just a matter of finding [creating] new weapons. (Deleuze 1990: 241–2)[1]

The awareness of the impossibility of any totalisation of reality by means of representation – i.e., the assumption of the local value of our theoretical instruments – as well as the renunciation of any kind of 'structural messianism' (Derrida 1993: 102) – i.e., the desertion of any promise of emancipation – embodies the demand for a thought capable of confronting the biopolitical mutations of capital, nonetheless, at the same time it leads struggle to a dispersion without precedent.

The 'minor' understood as a line of flight or a war machine did not establish the basis of a revolutionary political programme,[2] it actually developed in the very opposite direction, that of the organisation logics of traditional political movements (in this sense, Guattari reminds us that 'the search for a big unification of resistance forces would just make the work of the semiotisation of capital easier',[3] and Deleuze says that there is no such thing as a left-wing government – there are governments more or less receptive to the claims of the left, but the left has nothing to do with the form of the State or the logics of government).

Taking this into account, we should not be surprised when, confronted with the political dimension of Deleuze's work, Tony Negri speaks from the paradoxical place of the militant who finds in this philosophy a powerful inspiration to re-think the movement, but in

another sense, does not understand how it could be institutionalised: 'How could minor-becoming be effective? How could resistance become insurrection? Reading your writings, I always doubt the way these questions can be answered, even if I find in your works an impulse that forces me to reformulate them theoretically and pragmatically' (Deleuze 1990: 234). Negri celebrates the publishing of *Mille Plateaux*, which he considers a remarkable work of political philosophy, but regrets a tragic note in its excessive theoretical will, which leaves every problem open and does not determine where it can lead us.[4]

Here I pose the problem from a revolutionary perspective, but the questions raised by Negri could certainly also be raised from a progressive perspective; as is the case with Mengue, when he writes:

> If Deleuze offers us productive tools to emancipate us from the past and encourage us to commit the matricide of History, matrix of modernity, he just liberates us from it to throw us into an-historic becomings, but disconnected from any social or political effectuation ... the marriage between the spontaneist anarchism of the untimely and the long-term work of inscribing it on things and institutions is impossible ... they have opposite political directions ... The untimely does not lead to any form of institution ... That is, the guerrilla has deserted the political field closing itself on an unassailable but just ethical position. (Mengue 2003: 17, 155, 157)

In other words, the new instruments of analysis of capitalism, developed by Deleuze and Guattari, challenge – for Negri – the historical sense of struggle. If the de-totalisation, locality and dispersion of struggle come together with the renouncement to any historical possibility of revolution, why go on fighting? What are these lines of flight, subversion processes or forms of resistance worth, if revolution is, by definition, condemned?

Nevertheless, an idea of militant praxis is not that strange to Deleuze, who is looking for concepts that may bring us to an *an-historical* sense of struggle. Such a pragmatics could be put in terms of a series of impossibilities (as Deleuze would say): 1) the impossibility of a successful totalisation of life by power (thus, the impossibility of the fulfilment of History in the present); 2) the impossibility of any lasting subtraction of life from power (thus, the impossibility of the fulfilment of History in the future); and 3) the impossibility of the acceptance of the state of things, of the actual stratifications of life by power (thus, the impossibility of the recognition of History in the past).

What we have, therefore, is a notion of a militant praxis that, without giving in to the demands of power, but at the same time without aspiring

to power, embraces – beyond government and opposition – the vocation of resistance.[5] Thus:

1) Deleuze affirms, against all strategies of totalisation of life by power, against discipline or modulation of life by its *dispositifs*, that resistance comes first; i.e., that there is an essential contingency working out the inner nature of the social. Society is not a given totality: it is a puzzle of heterogeneous pieces, which do not always fit together ('here lies the problem of the world that globalisation wanted to reshape: pieces do not fit', says Marcos, in *Siete piezas sueltas del rompecabezas mundial*[6] [Subcomandante Marcos 1997]). Consequently, power formations are inhabited by an essential powerlessness. The social field is not composed by isolated and immutable formations: only stratifications of knowledge and power may give some stability to it, but in itself it is unstable, agitated, changing, as if depending on a 'paradoxical apriori', on a 'micro-agitation' (Deleuze 1986: 91).[7] There is no *dispositif* that, besides the points that it connects, does not imply relatively free or liberated points: points of creativity, points of mutation, points of resistance. The social field leaks everywhere. Lines of flight are the primary determinations, they are objective lines that pass through a society.

2) Deleuze does not ignore the historical failure of modern revolutionary projects. The way revolutionary groups betray their task is well known, but does not scare Deleuze (Deleuze 2002: 278; Deleuze 1995: 'G comme Gauche'). And if he admits that we will never assist again to a clear major break, opening a new kind of society, he also claims that revolutions – historically failing – produce effects immanently (incalculable effects) in that very history within which they fail. In this sense, in a 1988 interview, Deleuze said that 'there is a whole dimension of revolution that history does not catch: its becoming (another language, another subject, another object)' (Deleuze and Guattari 1991: 96–7), so, 'when it is said that revolutions have an infamous future, nothing has really been said yet about the revolutionary-becoming of people' (Deleuze 1990: 209).

3) So, Deleuze does not defend the ideals of a historical future, where a collective and lasting expression of liberated or egalitarian life could come to be true, nonetheless he wagers on the freedom effects of pure explosions of desire:

> even when revolutions failed, that did not prevent people from becoming revolutionary ... If someone says to me: 'You will see when they succeed, when they win ... It will not be good.' But then problems will not be the

> same, a new situation will be created and new becomings will break out. In situations of tyranny, of oppression, men have to become-revolutionary, because there is no other thing to do. (Deleuze 1995: 'G comme Gauche')

Briefly stated, Deleuze passes from *REVOLUTION* as the end of history, to *revolution* as a line of transformation, that is, to the affirmation of resistance, at the expense of revolution conceived as the radical and irreversible advent of a society finally totalised, not divided, reconciled.

A logics of the ephemeral, unpredictable, neutral *event*, substitutes for the global, determinist and teleological dialectic of *advent*.

This is the first positive principle (although in-voluntaristic) of Deleuze's militant praxis: 'becoming-revolutionary, *without* a future of revolution', 'a bifurcation, a divergence from the law, an unstable state that opens a new field of the possible', and which 'can be contradicted, repressed, recuperated, betrayed, but always entails something insurmountable' (Deleuze 1995: 'G comme Gauche'[8]; Deleuze 2003: 216). It is a matter of life, that takes place inside individuals as in the exteriority of society, creating new relations with the body, time, sexuality, culture, work; changes that 'do not wait for revolution, neither prefigure it, even if they are revolutionaries on their own: they have within themselves the power of resistance proper of poetic life' (Deleuze 2002: 200–1) (that is, displacing desire or reorganising life, make useless the *dispositifs* of knowledge and power that used to channel them).

In other words, those processes find their value in the fact that, by the time they take place, they escape from constituted knowledge and dominant powers, even if later they are continued in new *dispositifs* of knowledge and power.[9] The object of struggle, in this sense, is no more the fulfilment of a possibility, becoming essential divergence and multiplication of perspectives.[10] Zouravichbili reminds us that in *The German Ideology* Marx and Engels defined communism exactly this way (in opposition to utopian socialism): 'Communism is . . . neither a *state* that has to be created, nor an *ideal* for the ruling of society. We call communism the *real* movement that abolishes the actual state' (Marx and Engels 1976: 33).

Anyway, for these openings of the possible to be something other than a vision, for this new sensibility to be asserted, it is necessary to create proper assemblages. That creation is, after all, the task that gives consistency to this new militant praxis (therefore it is its second principle): the elaboration of new assemblages and the struggle for the

associated rights:

> When a social mutation takes place, it is not enough to think of the consequences or effects following lines of economical or political causality. It is necessary that the society creates collective assemblages, associated to the new subjectivity, in order to mature the mutation ... There is no solution unless it is creative. Only creative reconversions will contribute to resolving the actual crisis. (Deleuze 2003: 216–17)

This creation of assemblages covers the distance between becoming-revolutionary and 'left-wing civism' (according to the sharp formula of Claire Parnet). On account of the fact that, if events overcome any committed will (that is, events do not depend on objective or subjective possibility), to embrace or to ignore them defines an essential difference, that allows Deleuze to distinguish pragmatically left from right.[11] In this sense, the left-wing is defined by the search for assemblages in order to extend the movements triggered by events (and then, by the invention of rights from the new material conditions generated by mutations of desire). While the right-wing defines itself by the denial of movement and the opposition to any form of redistribution, the left-wing 'is a passion for procedures ... the collective catch of dynamics for the de-stratification of structures and re-arrangement of life and society following different forms of equilibrium' (Guattari 1984: 4).[12]

Nevertheless, if, according to Deleuze, May '68 is enough for the purpose of illustrating what he understands by revolutionary-becoming, it is not enough to illustrate the subjective reconversions.[13] Even creative and innovative answers to the objective and subjective demands of the mutations unchained by the event – the American New Deal, the Japanese take-off, and Iranian Muslim fundamentalism – imply all kinds of ambiguities and reactionary structures. May '68, on the other hand, was quickly recoded by the French government (with the help of the PCF). That is, even at the level of objectivity and the conscious and unconscious subjectivity of individuals and social groups, there are mutations of unpredictable consequences; power shows great shrewdness and a huge capacity for adaptation to the new forms of sensibility and new types of human relations resulting from the different 'mutations' (commercial recovery of marginal 'inventions'; relative tolerance in relation to zones of *laissez faire*, etc.). In other words, a semi-tolerated, semi-stimulated dissent is part of the system (and is instrumentally recovered by it).[14]

Creative articulation of the lines of flight in assemblages that allow them to mature is not just possible and desirable, but constitutes the constructivist vector of this new militant praxis. In *La révolution moléculaire* Guattari will make this the cornerstone of his political philosophy. The revolutionary character of the lines of flight that cross through a given society depends on their articulation, on the convergence of the subjective lines of flight with the objective lines of decoding of the system in suitable assemblages, creating an irreversible aspiration to new spaces of freedom. And Guattari offers us a minor example, one which is much less ambiguous than the examples given by Deleuze – I am referring to the case of free radio in the 1980s: an assemblage where the technological evolution (in particular, the miniaturisation of transmitters, and the fact that they could be 'assembled' by amateurs), 'concurred' with the collective aspiration for new media of expression. Another example of these objective and subjective mutations are the communities that appeared everywhere in the 1960s and '70s, in consonance with new musical genres, from rock to punk – with all the technical innovations that they presupposed, from amplifiers and synthesizers to acids, as well as the changes in subjective and objective conditions: the baby-boom, the welfare state, etc. Another example we know better is the internet. (From another point of view, maybe we could also inscribe all these minor examples into a major Marxist line, if, as Raya Dunayevskaya suggests, Marx set out, as a fundamental axis of his conception, the daily creation of new forms of struggle and new human relations between workers, between workers and the production infrastructures, etc. Dunayevskaya relates this conception of Marxism, more concerned with the fulfilment of freedom that with the conquest of institutions, to the creative acts performed by the Paris Commune, or, even, during the Russian revolution, to those actions that, in the auto-emancipating moment of birth, gave way to totally new forms of labour assemblages – such as the Soviets [Dunayevskaya 2004: 208]).[15]

Obviously, lines of flight are not necessarily revolutionary; a line of migration (sub-Saharan or Cuban) can end in death (at sea), or in much harder *dispositifs* than those which it left behind (slavery). And, obviously, these micro-revolutions do not lead automatically to a social revolution, to a new society, an economy or a culture liberated from capitalism.

Finally, there is no way to compare, according to a progressive set of values, which regimes are more harsh or more bearable (I mean, it is possible to do so retrospectively, but not at the moment of adopting a

line of action); the power of resistance or, on the contrary, submission to control, is decided in the course of each attempt. What matters is that, suddenly, we do not feel condemned in the same old way anymore; a problem which nobody could see a way out of, a problem in which everybody was trapped, suddenly ceases to exist, and we ask ourselves what we were talking about. Suddenly we are in another world, as Péguy said, the same problems do not arise anymore – though there will be many more, of course (Péguy 1957: 300–1).

Such is the scope and the limits of this new militant praxis that in a certain way responds to the demands of what Jean-Luc Nancy named 'literary communism' (Nancy 1983). As we saw at the beginning, in 1990, Negri could not help feeling a certain reluctance when confronted with it. Ten years later, however, with the publication of *Empire*, Negri offered us a free re-appropriation of Deleuze's thesis.

Deleuze and Guattari – after Foucault – appear then as the founding fathers of a new form of criticism, redefining the space of political and social struggles in relation to 'classic' Marxism: creation of spaces of freedom, strategies of torsion of power, conquest of individual and collective forms of subjectivity, invention of new forms of life, came to constitute the new subversive grammar.

Negri also seems to embrace the idea of an *an-historical* sense of struggle, at least if we read in a Deleuzian way the epigraph by William Morris that opens the book ('Men fight and lose the battle, and the thing that they fought for comes about in spite of their defeat, and then it turns out not to be what they meant, and other men have to fight for what they meant under another name' (Negri and Hardt 2000).

But we do not need to read much more to understand that *this post-structural comprehension of biopower that renews materialist thought* remains still unsatisfactory for Negri, because it just (and only) provides the elements for a superficial and ephemeral resistance (political work, for Negri, is not simply resistance, but an alternative political organisation, the institution of a new constituent power beyond the Empire).

For the wilful militancy of *Empire*, Deleuzian praxis is not enough. Attached to a classic Marxism, Negri renews once more the commitment to a dialectics in which we had no more faith ('We claim that Empire is better in the same way that Marx insists that capitalism is better than the forms of society and ways of production that came before it.... In the same way today we can see that Empire does away with the cruel regimes of modern power and also increases the potential for liberation'[16] [Negri and Hardt 2000: 43–4]), even if he denies its more

oppressive historicist elements ('This approach breaks methodologically with every philosophy of history in so far as it refuses any deterministic conception of historical development and any "rational" celebration of the result' [Negri and Hardt 2000: 66]). In this sense, the problem for Negri is still the problem of a new materialist teleology (in the line of Spinoza and the *Theological-Political Treatise*,[17] but maybe, as well, in the line of Merleau-Ponty's *Adventures of the Dialectic*, that is: there is no sense of History but an elimination of non-sense).

The problem lies elsewhere for Deleuze. There is no doubt that we do not possess, neither in fact nor by right, any reliable means to free and, *a fortiori*, to preserve the becomings that undermine the *dispositifs* of knowledge and power in which we are compromised: 'What condemns us to an everlasting "restlessness" ... We do not know how such a group can change, how it can fall back in history ... We do not dispose of the image of a proletariat which just needs to gain consciousness' (Deleuze 1990: 209). But this uncertainty does not imply any imperative of demobilisation.

Lacking the geopolitical options known decades ago, when it was still possible to chose between first and second worlds – thus, exposed either to inscription in the first world or sinking into the third – the struggle goes on. Lacking every form of social utopia – thus open to the dispersion of its local objectives – the struggle goes on. Deprived of any progressive project, of the idea that if we do everything possible things will improve, will change for the better – thus, aware of its tragic destiny – the struggle goes on.

Deleuze stakes the whole of his political thought on the effectuation and contra-effectuation of the untimely as the irruption or inscription of events in history, but at the same time he transvalues the essence of the event, which ceases to constitute the sense of History, becoming the agent of a redistribution of affects, relationships and singularities: the very revolutionary potential of events lies in their novelty or discrepancy in relation to a specific situation (objective modification of a state of things, but also the subjective assemblages of resistances and lines of flight):[18] 'Against apocalyptic history, there is a sense of history that matches with the possible, with the multiplicity of the possible, with the profusion of the possible in every moment' (Deleuze 2003: 183–4).

Deleuze and Guattari are not philosophers of liberation; the chances of transformation of the material organisation of life and desire, the possibility of molecular re-distributions of power and knowledge, do not imply for them the abolition of molar organisation as such. Which does not mean that revolution

> is just a dream, something that is never achieved, or that is achieved betraying it. On the contrary, it means to posit revolution as a plane of immanence or infinite movement, as long as these features are connected with the struggle against capitalism, here and now, and propel new struggles every time previous struggles are betrayed. (Deleuze and Guattari 1991: 97)

What is to be done? The old Leninist question still hangs over us, with an irresistible weight, even if we are convinced that there is no answer but a creative one (but 'to create' is not a satisfactory answer for the question).

The question would lie, today, before and beyond any programme of action: How to embrace such politics, a politics that proposes struggle, not as revolution, but just as resistance? How to embrace it when we are fully aware of the local, strategic and non-totalisable value of the changes we can aspire to?

We gave up utopias. Perhaps we will never grow up, as Kant wished. Philosophy relinquishes, in this sense, the possession of power (by right) and the (factual) property of knowledge.

Maybe this is why, unlike Marx's, Deleuze's work does not constitute the insurmountable philosophy of our time. But in its imperative precariousness, in its radical minority, it still shows a unique critical power, and outlines maps on the desert of the real (in a desert full of mirages). In its joyful proclamation of a thought of immanence, beyond any reliance on moral or messianic structures, it still gives us reasons for resistance, to go on thinking, when it comes impossible to go on seeing certain things without doing nothing, or go on living as we do. (Neither dreams nor hopes, not even fidelity to old utopias;[19] it is just a question of perception, of sensibility, and, immediately, a problem of creation.[20])

The production and administration of inequality, of injustice, of misery, are still a pervasive reality in our societies. The attempts of the most different formations of power to control life collide, and will keep colliding, with the shocking fact that the pieces do not fit. Power claims to deal with this fact just as a spare, as junk. But included in that spare are thousands, millions of people convicted every day (people who die from diseases that a simple pill could cure, victims of collateral damage from anti-terrorist operations, but also students educated for unemployment, adolescents enclosed in urban ghettos or suburbs, elderly people without pensions or social security).

We do not have faith in the advent of a new happy world, but we cannot renounce to the exercise of a resistant thought, in the difficult, unpredictable and dangerous intersection of our powerlessness and our

ignorance. Without it, the various dystopias that may be glimpsed on the horizon would see the space that distances them from their total or totalitarian fulfilment surmounted.[21]

Thus, the new revolutionary praxis will be, in the first place, a work of de-totalisation of life (the creation of a world in which many worlds could fit, in which all possible worlds could fit). And it will be, also, an everlasting work, because power learns from its mistakes and knows how to take advantage of its defeats. (But will we stop working for that reason?) After all, as Deleuze and Guattari say:

> the success of a struggle lies just in the very struggle, in the vibrations, in the embracing, in the openness that it gives to men at the moment it takes place, and that compounds in itself a monument, always in progress, as those graves where every new traveler adds a stone. The victory of a struggle is immanent, and consists in the new relations it sets up between men, even if they do not last more than their material fusion, and they quickly give place to division, to betrayal. (Deleuze and Guattari 1991: 167)

Thought is the monument of that struggle, always to start over again in the labyrinth of the mixed up battles in which we are compromised every day. A monument that does not commemorate anything, does not honour anyone, but whispers at the ear of the future the feelings that embody the everlasting suffering of men, and its recreated protest, its sustained fight.

In this sense, struggle *without* any future of revolution comes to transvalue the imperatives of compromise we inherited from past generations; it comes to give them sense, necessarily a new sense, in these winter years of *every man for himself*.

I think of the words Sartre raised so many times as a flag: 'Everything I do is probably destined to failure, but I still do it, against all odds, because it has to be done.'[22]

But I think also, as counterpoint, of the tough, excessive, desperate order-word, in which – against the setbacks of our recent history – the sense of a remarkable event that goes by the name of Ernesto 'Che' Guevara survives:

Hasta la victoria siempre!

Notes

1. There is no hope of progress, no expectation of a complete vanishing of problems, but that does not signify the absence of an immanent hope, that is, hope of getting out – through creative solutions – of the mousetraps (Sartre) in which we find ourselves caught. Each *dispositif* implies new submissions, but also, certainly, new lines of flight: 'Dans le capitalisme il y a donc un caractère

nouveau pris par les lignes de fuite, et aussi des potentialités révolutionnaires d'un type nouveau. Vous voyez, il y a de l'espoir' (Deleuze 2002: 376). As a matter of fact, from this statement to the affirmation of Empire as a better sociopolitical assemblage (in the same sense that Marx maintained that capitalism was better than the modes of production that preceded it) there is a long way that won't be surpassed by Deleuze.

2. Even if *L'Anti-Oedipe* ends with a 'Program for desiring machines', schizoanalysis 'does not have a proper political program to propose' (Deleuze and Guattari 1973: 380). On the contrary, it raises a series of conceptual contrasts that allow us to analyse social fields or processes, evaluating the assemblages at stake (see Patton 2000: 71).
3. 'Well, I don't think so because, once again, the molecular revolution is not something that will constitute a program. It's something that develops precisely in the direction of diversity, of a multiplicity of perspectives, of creating the conditions for the maximum impetus of processes of singularisation. It's not a question of creating agreement; on the contrary, the less we agree, the more we create an area, a field of vitality in different branches of this phylum of molecular revolution, and the more we reinforce this area. It's a completely different logic from the organisational, arborescent logic that we know in political or union movements' (Guattari and Stivale 1985). See also Anne Querrien, 'Esquizoanálisis, capitalismo y libertad. La larga marcha de los desafiliados', in Guattari (2004: 28).
4. Negri's worry about the institutionalisation of Deleuzian political philosophy was not strange to Guattari, who regretted the difficulties that molecular revolutions have creating links between singular achievements: 'Will these micro-revolutions, these profound impugnations of social relationships, be put away to restricted spheres of the social field? Or will they be articulated in new "social segmentations" that won't imply the restitution of hierarchy and segregation? In short, will all these micro-revolutions set up a new revolution? Will they be capable of "assuming" not just the local problems, but the management of big economic sets? ... How far could these molecular revolutions go? Aren't they condemned, at best, to vegetate in German style ghettos? Is the molecular sabotage of the dominant social subjectivity enough in itself? Should molecular revolutions make alliances with social forces at the molar (global) level? ... How can we imagine, then, revolutionary war machines of a new type that could graft, at the same time, into the manifest social contradictions and these molecular revolutions?' (Guattari 2004: 54). 'We cannot be content with these analogies and affinities; we must also try to construct a social practice, to construct new ways of intervention, this time no longer in molecular, but molar relationships, in political and social power relations, in order to avoid watching the systematic, recurring defeat that we knew during the '70s, particularly in Italy with the enormous rise of repression linked to an event, in itself repressive, which was the rise of terrorism' (Guattari and Stivale 1985). This very same problem concerns Deleuze. But the multiplicity of revolutionary focuses does not represent a lack or a weakness for him, but a power (potentia) of resistance to power (potestas). Talking with Foucault, in fact, Deleuze said that 'les réseaux, les liaisons transversales entre ces points actifs discontinus, d'un pays à un autre ou à l'intérieur d'un même pays', even when imprecise, they imply 'qu'on ne peut en rien toucher à un point quelconque d'application sans qu'on se trouve confronté à cet ensemble diffus, que dès lors on est forcément amené à vouloir faire sauter, à partir de la plus petite revendication qui soit. Toute défense ou attaque révolutionnaire partielle rejoint de cette façon la lutte ouvrière' (Deleuze 2002: 287–98).

5. Cf. Tomás Segovia's 'Alegatorio', in Subcomandante Marcos (1997): 'First, I beg you not to mix up Resistance with political opposition. Opposition does not oppose to power but to government, and its complete and successful form is the party; on the other hand, Resistance, now by definition, can't be a party: It is not made for government, but to . . . resist.'
6. Cf. Alemán (2007: 91): 'There is no reality, as consistent and hegemonic as it may appear, as, for example, actual capitalism, that could be considered definitive. . . . To be left-winged implies insisting on the contingent character of the historic reality of Capitalism. Even when the way out or the passage to another reality is defered, even if that transit has no guarantee and could stay unfinished, even if that other reality, different of Capitalism, could not be call Socialism.'
7. Every assemblage presents, on one hand, a stratification more or less hard (let us say, the *dispositifs* of power; Deleuze says: 'a concretion of power, of desire and territoriality or reterritorialisation, ruled by the abstractions of a transcendent law'), but, on the other hand, implies points of deterritorialisation, lines of flight where it is disarticulated and transformed ('where desire is liberated of all its concretions and abstractions', says Deleuze).
8. 'Par "nouveau champ de possibles", il faut donc entendre autre chose: le mot possible a cessé de désigner la série des alternatives réelles et imaginaires (ou bien. . . ou bien. . .), l'ensemble des disjonctions exclusives caractéristiques d'une époque et d'une société données. Il concerne à présent l'émergence dynamique de nouveau. C'est l'inspiration bergsonienne de la pensée politique de Deleuze' (Zourabichvili 1998: 339).
9. '[I]ls ont bien une spontanéité rebelle. . . . Ils se lèvent un instant, et c'est ce moment-là qui est important, c'est la chance qu'il faut saisir. . . . Croire au monde, c'est ce qui nous manque le plus; nous avons tout à fait perdu le monde, on nous en a dépossédé. Croire au monde, c'est aussi bien susciter des événements même petits qui échappent au contrôle, ou faire naître de nouveaux espaces-temps, même de surface ou de volume réduits' (Deleuze 1990: 238).
10. 'L'événement n'ouvre pas un nouveau champ du réalisable, et le "champ de possibles" ne se confond pas avec la délimitation du réalisable dans une société donnée (même s'il en indique ou en induit le redécoupage). L'ouverture de possible est-elle alors un but, le problème étant moins de construire l'avenir que d'entretenir des perspectives à son sujet. . . . On passe ici à un autre régime de possibilité, qui n'a plus rien à voir avec la disponibilité actuelle d'un projet a réaliser, ou avec l'acception vulgaire du mot 'utopie' (l'image d'une nouvelle situation qu'on prétend substituer brutalement à l'actuelle, espérant rejoindre le réel à partir de l'imaginaire: opération sur le réel, plutôt que du réel même). Le possible arrive par l'événement et non l'inverse; l'événement politique par excellence – la révolution – n'est pas la réalisation d'un possible, mais une ouverture de possible . . . Le possible est le virtuel : c'est lui que la droite nie, et que la gauche dénature en se le représentant comme projet' (Zourabichvili 1998: 345).
11. Anyway, Guattari considers that one of the tasks of political commitment could consist in the precipitation of events: it consists in the active research of those differences that take place against the homogenising movement of integrated world capitalism.
12. Deleuzian involuntarism collides with Gramscian concept of political commitment: pessimism of reason, optimism of will. The left-wing, indeed, generally defined itself through voluntarism, that is, by means of the idea that if we do all we have to do, that if we do everything we can (following the guidelines of a revolutionary project, in this case), things will necessarily change

for better. Deleuzian involuntarism implies a problematisation of this idea, but this certainly does not mean a total alienation of the political by the pessimism of reason. In fact, what is put in question by Deleuze is the hope of a total fulfilment of revolutionary projects, not the will of change. Then, the question that has to be raised is: what kind of action is possible without the hope of its total fulfilment? Does the impugnation of any project's fulfilment imply the impugnation of the very notion of will? I would say that Deleuze probably meets up here with the sense that Duns Scot or Schopenhauer used to give to the concept of voluntarism, that is, the principle according to which will is the first of human spiritual powers (previous, in that sense, to reason or intellect). Certainly, this will is not for Deleuze a subjective will, but an impersonal, event-by-product will (but isn't this the case with all doctrines of will?). Deep down, Deleuzian involuntarism states that a subjective mutation can't be decided, that is, that a subjective mutation could never be the outcome of a dedicated fulfilment of an idea postulated by reason; it is, indeed, the impersonal will of the event which decides a new sharing out of the affects, a new circumscription of the intolerable ('the event is the very revolutionary potential itself' [Zourabichvili 1998: 354]); it is that impersonal will in relation to which we can react (oppose some kind of resistance) or respond (the subjective mutation is real, but it must be prolonged by a rational assemblage of the new relations that it provokes or shows). In this sense, as suggested by François Zourabichvili (who has said the most interesting things about this), change is not to come, but is inscribed as a tendency in the contradictions of a situation in which we are compromised, that authorises us to talk about the future without having a relapse into fantasy; it can be deciphered in the very becoming of present (actuality), by opposition to the structure of fulfilment that has the future as an image thanks to the dialectical apparatus. Between the act of deciphering the future at the level of the virtual, and its assemblage at the level of the actual, there must exist an act of creation, and not the mere fulfilment of a possible (system of alternatives): 'le néant de volonté procède à la destitution d'un faux problème: le système des alternatives. Son envers, ou la consistance positive de la politique, est l'élaboration expérimentale de nouveaux agencements concrets, est l'élaboration expérimentale de nouveaux agencements concrets, et la lutte pour l'affirmation des droits correspondants' (Zourabichvili 1998: 354). In short, even if it is not possible to talk about hope in the context of this militant praxis, neither can we conclude a politics of total despair. Deleuze writes: 'ne pas savoir d'avance comment quelqu'un, éventuellement, se trouvera capable d'instaurer en lui et hors de lui un processus de rationalisation. Certes il y a tous les cas perdus, le désespoir. Mais s'il y a une chance, de quoi quelqu'un a-t-il besoin, comment procède-t-il pour sortir de ses démolitions? Tous peut-être, nous naissons sur un sol de démolition, mais nous ne gâcherons aucune chance. Il n'y a pas de Raison pure, ou de rationalité par excellence. Il y a des processus de rationalisation, hétérogènes, très différents suivant les domaines, les époques, les groupes et les personnes. Ils ne cessent d'avorter, de glisser, d'aller dans des impasses, mais aussi de se reprendre ailleurs, avec de nouvelles mesures, de nouveaux rythmes, de nouvelles allures' (Deleuze 1988: 14–15).

13. '[S]uivre les flux qui constituent autant de lignes de fuite dans la société capitaliste, et opérer des ruptures, imposer des coupures au sein même du déterminisme social et de la causalité historique; dégager les agents collectifs d'énonciation capables de former les nouveaux énoncés de désir; constituer non pas une avant-garde, mais des groupes en adjacence avec les processus sociaux, et qui s'emploient seulement à faire avancer une vérité sur des chemins où elle ne s'engage jamais d'ordinaire; bref, une subjectivité

révolutionnaire par rapport à laquelle il n'y a plus lieu de se demander ce qui est premier, des déterminations économiques, politiques, libidinales, etc., puisqu'elle traverse les ordres traditionnellement séparés; saisir ce point de rupture où, précisément, l'économie politique et l'économie libidinale ne font plus qu'un. . . . Le mouvement du 22 Mars reste exemplaire à cet égard . . . sans prétention d'avant-garde ou d'hégémonie, simple support permettant le transfert et la levée des inhibitions' (Deleuze 2002: 279). (The movement of March 22 was an anti-establishment student movement that, headed by Daniel Cohn-Bendit, would be the revolutionary seed of May '68.)

14. Yet, everything comes to flee again, opposing to the biopolitical articulation of society a series of insurmountable becomings in the domain of libidinal economy: Daily relationships between women and men, homosexuals and heterosexuals, children, adults, etc., as well as production mutations, imply coefficients of freedom irretrievable to the dominant system (Guattari 2004: 68–9): 'J'ai beaucoup de mal à imaginer une petite communauté libérée qui se maintiendrait au travers des flux de la société répressive, comme l'addition d'individus tour à tour affranchis. Si le désir constitue en revanche la texture même de la société dans son ensemble, y compris dans ses mécanismes de reproduction, un mouvement de libération peut "cristalliser" dans l'ensemble de la société' (Deleuze 2002: 370) (it is Guattari who speaks this way).
15. Cf. Kaufman (2007: 67): 'A left-wing perspective would be a perspective involved with the antagonisms that structure the conditions of injustice, much more than with the institutional modalities that result from this concern.'
16. 'Although Empire may have played a role in putting an end to colonialism and imperialism, it nonetheless constructs its own relationships of power based on exploitation that are in many respects more brutal than those it destroyed. . . . Despite recognizing all this, we insist on asserting that the construction of Empire is a step forward in order to do away with any nostalgia for the power structures that preceded it and refuse any political strategy that involves returning to that old arrangement, such as trying to resurrect the nation-state to protect against global capital. We claim that Empire is better in the same way that Marx insists that capitalism is better than the forms of society and modes of production that came before it' (Negri and Hardt 2000: 61).
17. 'In contrast, any postmodern liberation must be achieved within this world, on the plane of immanence, with no possibility of any even utopian outside. . . . Perhaps we need to reinvent the notion of the materialist teleology that Spinoza proclaimed at the dawn of modernity when he claimed that the prophet produces its own people' (Negri and Hardt 2000: 83). 'There is not finally here any determinism or utopia: this is rather a radical counter-power, ontologically grounded not on any "*vide pour le futur*" but on the actual activity of the multitude, its creation, production, and power – a materialist teleology' (Negri and Hardt 2000: 66).
18. 'La rupture des schèmes, ou la fuite hors des clichés, ne conduit certes pas à un état de résignation ou de révolte tout intérieure: résister se distingue de réagir. Résister est le propre d'une volonté dérivée de l'événement, qui s'alimente à l'intolérable. L'événement est le "potentiel révolutionnaire" même, qui se tarit lorsqu'il est rabattu sur des images toutes faites (clichés de la misère et la revendication)' (Zourabichvili 1998: 354). 'Un événement politique est du même type: une nouvelle répartition des affects, une nouvelle circonscription de *l'intolérable*' (Zourabichvili 1998: 341).
19. 'Pourquoi se révolter? En dehors de l'intérêt spécifique qui motive telle lutte pour ceux qui sont directement concernés, quelle raison de s'engager au côté de la subversion? Est-ce une question de *morale* ou d'éthique, de simple dignité

pour soi-même, comme on a envie de répondre, qui plus que toute autre chose nous obligerait à écouter la voix des insoumis, des victimes, des singularités qui se dressent un moment, un instant se soulèvent? . . . Pourquoi se révolter? Par rêve, espoir, fidélité à l'utopie . . . Soit. Mais, du coup, le caractère de ce désir le rapproche dangereusement du désir freudien, dirait-on. Ce désir, en effet, à jamais insatisfait historiquement, *comment peut-il se maintenir*, et relancer continûment dans l'histoire des actions toujours nouvelles sans sombrer dans le découragement, le désespoir? . . . Éthique et rébellion. Qui a pour mot d'ordre: On a toujours raison de se révolter. . . . La révolution comme promesse d'un juste état social et politique, a disparu. Ce qu'il en reste donc, c'est, exactement, un mode de vie, *un style d'existence*, avec une forme particulière de rapport à soi et aux autres' (Mengue 2003 : 146–57).

20. '*On ne peut que* répondre à l'événement, parce qu'on ne peut pas vivre dans un monde qu'on ne supporte plus, en tant qu'on ne le supporte plus. Il y a là une responsabilité spéciale, étrangère à celle des gouvernements et des sujets majeurs, responsabilité proprement révolutionnaire. On n'est ici responsable de rien, ni de personne; on ne représente ni un projet ni les intérêts d'une collectivité (puisque ces intérêts sont précisément en train de changer et qu'on ne sait pas bien encore dans quel sens). On est responsable devant l'événement' (Zourabichvili 1998: 347).
21. I think that the generic threat of totalisation is, nowadays, much more worrying than eventual totalitarian threats. Capitalistic totalisation – under the forms of control societies (Deleuze), integrated world capitalism (Guattari), or empire (Negri-Hardt) – implies a vast number of forms that go much further than dictatorial (military or party based) totalitarianisms. Current capitalism, indeed, establishes in our societies a kind of symbolic totalitarianism, a totalisation that overdetermines reality by representation, and reaches zones which traditionally are far away from power. Clumsy forms of totalitarianism are, from this point of view, just a violent and voluntaristic reaction of states facing up to the failure of operational totalisations by worldwide legitimated *dispositifs* of knowledge and power (and, in this sense, they represent a kind of step backwards in the direction of archaic *dispositifs*: discipline, sovereignty, etc.).
22. Cf. Jeanson (1975: 286). I owe this reference to Ignacio Quepons (G. C.), faithful friend and tireless partner in this patient job of giving form to the impatience of freedom.

Politicising Deleuzian Thought, or, Minority's Position within Marxism

Guillaume Sibertin-Blanc University Toulouse-Le Mirail

Translated by Daniel Richter

Abstract

This text provides an analysis of the Deleuzian theory of minorities. Its hypothesis is that this theory produces a double effect of interpellation: upon a materialistic reading of the philosophy of Deleuze, and upon the theoretical and political heritage of Marxism. Concerning the first aspect, the thesis of an actual multiplication of 'becomings-minoritarian' reopening 'the question of the becoming-revolutionary of people, at every level, in every place', has to be referred to the Deleuzo-Guattarian analysis of the conjuncture – namely, to a diagnosis of the global capitalist system's dynamisms and the contradictions they produce in the social, juridical and political institutions of national States. Concerning the second aspect, I confront the adversities faced by minorities with the schema of the classes struggle, and I examine certain links (of continuation and integration, but also differentiation) between the processes of 'proletarianisation' and 'becoming-minoritarian', that is to say, between two ways of problematising the collective subject of a revolutionary politics of emancipation. Finally I assert that the concept of 'becoming-minoritarian' makes of the possibility of an unprecedented internationalism the way to a renewal of the two concepts between which the horizon of modern political thought extends, and around which the tradition of political liberalism and thinkers of a revolutionary politics have never ceased to confront one another: autonomy and universality.

Keywords: Deleuzian politics, minorities, the State, global capitalism, social struggles, universalism, internationalism

I. Writing in Minor/Reading Deleuze Politically

The question of minorities touches at the heart of Deleuze's political thought, taking place as it does where the category of the 'political' becomes in every way problematic. This is true from several points of view: from the point of view of the political meanings of this category in the progression of Deleuze's work; from that of its effective political implications (in the forms of theoretical instruments of decoding of the relations of social forces, of location in these relations, of prescriptions of intervention or simple tactical indicators); and from that of the manner in which one defines what it means to 'read politically'. Here we must often hesitate between the first two points of view, which are perhaps never entirely dissociable but which do not overlap unless thus coerced – in other words, between a hermeneutic of the political, and a theoretical practice with political effects. It is certainly not a coincidence that the terminological series minority–major–minor begins to form the base of a specific conceptual work, in *Kafka: Toward a Minor Literature* in 1975, about a literary experience which for Deleuze and Guattari directly poses the theoretical and practical question of ways of writing and reading (they will draw conclusions on this the following year in their theory of the book, *Rhizome*). In the first place, minorities are not thought of as 'objects' of reflection, nor as 'objects' of historical, political or sociological knowledge. Rather, they are positions and processes interior to a practice of writing (in this case literary), processes interior to language which condition a creative transformation of collective regimes of enunciation. Of course these processes themselves recall social and historic coordinates: upheavals of frontiers and migratory dynamics linked to the history of imperialism, the evolution of multinational empires, annexationist movements and creations of States, territorial redrawings and populational displacements resulting from revolutions and from the end of the First World War which will make of minorities, following the formula of Arendt, a 'permanent institution' throughout the juridico-political structure of the nation-state.[1] And for Kafka himself we recall the status of the Czech Jewish minority throughout the Austro-Hungarian Empire, the decline of this Empire and the rise of nationalist struggles, the sociolinguistic circumstances of this minority in the Prague of the beginning of the century. These circumstances were characterised by the coexistence of three languages. Lingua franca German was the official language of administration, business, culture and university. Czech was the vernacular language of most of the population, characterised by an increasingly conflicting relation with

German domination. Finally, Yiddish was spoken by some of the Jewish, mostly Germanophone population and scorned by Czechs and Germans alike (Wagenbach 1967: 65–71). What is most important for Deleuze is the impact that such complex circumstances will have upon the domination of a major language. When the hegemony of a major language is established, there are always tensions and conflicts at work within it; correlatively, the language is permeated by creative initiatives and all sorts of vectors involved in an immanent politicising of its enunciation (Deleuze and Guattari 1986: 23–7; Deleuze and Guattari 1987: 101–5).

In this sense, the Deleuzian theory of minorities appears first in the problematising of the endogenous conflict which weakens every system of 'majority' from the inside. These 'systems of majority' are characterised by the hegemony of a normative ensemble which both determines the social inscription of practices, conducts and human multiplicities, and manages regimes of expression and subjective positions in which groups and persons are individualised. It is within these regimes that interests, demands, memberships, distinctions, recognitions and identifications are articulated (Deleuze and Guattari 1987: 105–6). From this standpoint, the norms of the language imposed as the 'standard', along with the norms of discursive practices in force in an institutional fabric, do not compose one hegemony among others. They compose rather the hegemony that all the others presuppose and by which they are reproduced. But the German of Prague for Kafka – the language of political, economic and cultural power – is not imposed as a major language without being simultaneously affected by multiple vectors of transformation which bear witness to effects produced on the inside of this language by geographical movements and human migrations, relations of social forces, displacements and destabilisations of the geopolitical balance of powers. The German language had already been deterritorialised from its economic domains and its commercial functions by the development of English as the new language of exchange. It had also been transformed in bureaucratic spheres by the administrators of Hapsburg established in Prague who transformed aristocratic German into unheard of variations. German thus became especially suited for 'strange and minor uses' for recently urbanised Czech and Jewish populations – 'this can be compared in another context to what blacks in America today are able to do with the English language' (Deleuze and Guattari 1986: 17) – such as that 'inextricable mixture of German and Czech' which forms *Kuchelböhmisch*, or that 'sort of Germanized Yiddish', *Mauscheldeutsch* (Wagenbach 1967: 79).

The German learned by Kafka (following his father's desire for him to climb the social ladder), 'this German taught by our non-German mothers', as he writes to Max Brod, resembles a fluid form with irregular intonations, and is riddled with syntactical errors and semantic fluctuations. It is not a minor language derived from or opposed to the major language but rather a 'minorisation' of the major language itself, whose resources Kafka could mine for another language capable of sweeping away the narrative contents and their actantial schemata.[2]

Such an immanent politicising of the means of enunciation which the Kafkan oeuvre, in its own historical conjuncture, allows to come to light, is not to be confused with the struggles of national minorities, nor does it figure there as an ideological instrument (in the sense for example that the construction of a literary history may intervene in the ideological struggle to impose the recognition of a national identity). It is conditioned by historical processes which 'minorise' a system of majority, or in other words, which subject the normative constants of this system to variations or deviations not coded *by* the system. It can only be actualised by a practical appropriation of these processes by assemblages (*agencements*) capable of experimenting with their potentialities for transformation. Even so, such practical assemblages are necessarily linked to the aforementioned struggles, and the Kafkan literary machine is itself adjacently connected to them in a historic conjuncture which determines literary writing as decisive in the formation of a collective conscience which does not yet exist and thus remains uncertain. It is not so much a question of literary history as of the actual creation of new forms of collective expression and enunciation, in a historical milieu where the objective conditions of such an enunciation are everywhere lacking outside of literature.[3] We shall name 'minor' these enunciative creations (which are not only literary, but political, theoretical or philosophical) that are capable of creating a new language *in* a major or dominant language and, in minorising it, forging 'the means of another consciousness and another sensibility', striving to induce a *becoming-revolutionary* in the minorities to which they are connected. The problem is then that of more precisely determining the nature of this connection, for it conditions both the structure of conflictuality potentially within every majoritarian system, and the concept of the specific effectiveness, in such a system, of these minor practices. These latter are enacted from within by the actual or potential struggle of minorities. In other words, they occupy 'positions of minority' in a discourse, in the sense used by Marxists who talk of 'class positions on the inside of the theory'. We will return to this analogy,

which has its limits. We mention limits precisely because it is *more* than an analogy: it is a profound problematic similarity. But we can already reformulate the initial problem. In what sense would the analyses of minorities conducted by Deleuze be themselves enacted from within by such minoritarian processes? At what point does one find in Deleuze, not only a political theory of minorities, or an interpretation of the political signification of minorities today, but a possible politicising of his thought which could be identified with his internal minor positions? At what point could what Deleuze writes concerning 'minor' literary enunciation serve for a political enunciation in Deleuze's philosophy? Or, to twist a formulation of Louis Althusser: in what sense could Deleuzian philosophy claim to instantiate the struggles of minorities in theory and political thought?

II. Minorities in the Becoming-Revolutionary of the Actual Situation

This questioning cannot begin with considerations on 'minorities' or 'becomings' in general. Rather, they should start at the exact location where Deleuze explicitly formulates his political diagnostic of the actual situation. A double and significant location, in fact, in two texts which echo and are connected one to the other: the penultimate paragraph of *Dialogues* from 1977 ('What characterizes our situation is both beyond and on this side of the State. *Beyond* national States...'), and the last sections of the thirteenth 'plateau' which presents in 1980 the Deleuzo-Guattarian theory of the apparatus of State ('6. Minorities. – Ours is becoming the age of minorities...'). In fact nothing less than the locating of this conjuncture seems capable of shedding light on certain factors that are relevant for us here:

- The extension which is effectuated in Deleuze's use of the term 'minorities', and correlatively its apparent dispersion in a work which never attempts to subsume multiplicity under a principle of objective or subjective identity, such as a State or a class.
- The formalisation, beyond the example case of Kafka, of the specific conflictuality of minorities, which leads Deleuze to identify in the actual multiplication of minoritarian sets the indication of a re-emergence of a global revolutionary movement.
- The theoretical gesture, accordingly perhaps less paradoxical than it appears, by which Deleuze makes of this becoming-minoritarian of increasingly numerous social and cultural multiplicities the way to a

> renewal of the two concepts between which extends the horizon of modern political thought, and around which the tradition of political liberalism and thinkers of a revolutionary politics have never ceased to confront one another: autonomy and universality.

Actually these ostensibly different aspects are intimately linked together. At any rate, they must be, for the overlapping of a 'becoming-minoritarian' and a 'becoming-revolutionary' not to be illusory, for the affirmation of a 'becoming-minoritarian of everyone' not to be reduced to a speculative formula empty of all effective content, and for the very term 'revolutionary' not to conceal a political vacuity. Bearing this in mind, we will put forward the hypothesis that the emergence of the multiplication of minoritarian struggles, in the analysis of the conjuncture which Deleuze carries out, takes over from class struggle. This does not mean that it simply supplants class struggles, but rather that it prolongs them while complicating their coordinates and transforming their modes of realisation, but also interiorising certain of their presuppositions and difficulties. This must be understood in at least three senses, which will permit us to assess both the continuity and the difference between the two forms of struggle.

1. Minorisation and proletarianisation in the State-form

Firstly, the factors related to the constitution of minorities are not fundamentally different from the factors of proletarianisation. When Deleuze and Guattari write that 'the power of minority, of particularity, finds its figure or its universal consciousness in the proletariat' (Deleuze and Guattari 1987: 472) it is in the first place because their concept of minority redraws the demarcating line of the base of Marxist communism and utopian communism. We find here a refusal to consider the socioeconomic structure's forces of rupture independently of the contradictory dynamics by which the structure sustains these forces within itself, and by which it at least partially conditions their forms of crystallisation and effectuation. This is why they index their locating of becomings-minoritarian upon the systematic dynamics of worldwide capitalism, which proceed *de facto* to their real generalisation. Adhering to the geo-economic and geopolitical axes of capital accumulation within relations of unequal dependence between 'Centre' and 'Peripheries', the following are considered by Deleuze and Guattari the principal factors which engender minoritarian sets: decodings of alimentary flows generating famine, decodings of populational and urban flows through

the dismantling of indigenous habitats and urbanisations, and decodings of flows of matter-energy generating political and monetary instability. In accordance with the transformations of relations between constant capital and variable capital in the countries of the Centre, the following lead to the formation of 'peripheral' zones of underdevelopment within the countries of the Centre itself: the development of a 'floating' and precarious labour force of which 'official subsistence is assured only by State allocations and wages subject to interruption', and the development of an 'intensive surplus labor that no longer even takes the route of labor' but goes through the modes of life, the collective forms of expression, the means of communication, circulation and consumption and so on. These sorts of 'internal Third Worlds' or 'internal Souths' foment many new struggles in all the linguistic, ethnic, regional, sexist, juvenile domains, but such struggles are always overdetermined by the global system of unequal dependence (Deleuze and Parnet 1987: 145–7; Deleuze and Guattari 1987: 468–9).

The global capitalist system 'minorises' as much as it proletarianises. The difference between the two points of view will thus be all the more pronounced. The Marxist notion of the proletariat entails a triple consideration: its position within the structure of production, determined at minimum by its dispossession of the means of production and its insertion into the process of production as a pure, abstract labour force; the big industry working population's living conditions, which involve not only the homogenisation of human misery, but populational concentration and the appearance of forms of cooperation which produce, within the 'pores' of industrial sites, unheard forms of solidarity, of relationships and collective consciousness; the power of becoming of that which thus tends to be constituted as a class, or following the expression of Etienne Balibar, its transitional value. While considering the surprising rarity within *Das Kapital* of the notion of the proletariat – a notion which nevertheless condensed until then for Marx all the implications of the 'point of view of class' – Balibar remarks:

> Everything happened as if the proletariat as such had nothing to do with the positive function that the exploited labour force carries out in the sphere of production, in so far as 'productive force' above all else; as if it had nothing to do with the formation of value, the transformation of surplus labour into surplus value, the metamorphosis of 'living work' into 'capital'. (Balibar 1997: 223)

As if in the end this very term connoted nothing more than the 'transitional' character of the working class, or the manner in which

the historically untenable character of capitalist accumulation (which was already preparing the material conditions of 'another transition which would annul the preceding one') was inscribed into the workers' condition, an unstable state in relation to 'normal' social existence (Balibar 1997: 222–3). In a strikingly similar vein, the Deleuzian notion of minority seems firstly to involve a signified that remains problematic, and secondly to indicate nothing other than the transitional vector of a substratum which is fundamentally unstable, and even unassignable (the 'becoming-minoritarian of everybody'). However, no effacement of the signifier results; on the contrary, the signifier's proliferation is found at all levels of the analysis between 1975 and 1980, a proliferation which seems to challenge every attempt to reassemble their instances and occurrences into a unitary form.

This is because minorities are nothing other than 'proletarianised' masses, but they are masses inasmuch as they are immediately formed within institutional, social, juridical and ideological structures of national States. Dissociated from a strictly economic determination of the proletariat as well as from a strictly sociological determination of the working class, the concept of minority records the State's process of socialisation, that is to say, the process through which State power is incorporated into the social and institutional structures of the capitalist formation. We could thus call 'minorisation' that internal distance, in the process of proletarianisation, between that which is expropriated of all social power throughout the structure of production, and that which is partially (and unequally) reintegrated into the liberal State-form, through social and political rights, statutory and symbolic recognitions, organs of representation and delegation. Consequently, the notion of minority involves an irreducible multiplicity, which is neither soluble in the sketch of a contradiction between capital and labour, nor in the supposed homogeneity of workers' conditions. The minoritarian sets recall, in their very constitution, the variability of national frameworks and of State apparatuses which manage these sets, which partially integrate them, and which conflict with them in multiple ways. This multiplicity depends on 1) the variability of States' positions within the international division of labour and the unequal integration of their interior market into the global market (Deleuze and Guattari 1987: 461–2); 2) the variability of political structures and regimes fluctuating between social-democratic and totalitarian poles, namely between institutional and juridical integration of minorities as 'subsystems', and exclusion 'outside the system' of minorities subsequently abandoned to repressive State violence (Deleuze and

Guattari 1987: 462–3); 3) the correlative variability of the forms and degrees of development of minoritarian struggles; 4) the variability of the types of political manipulation of minorities. We know at least two functions of such a manipulation: the instrumentalisation of immigrant workers in order to repeat the classical process of forcing producers into competition and sowing dissension into the working class (Noiriel 2005: 108–22); the 'displacement' of social conflicts onto 'cultural' norms – regarding place of residence, ethnicity, linguistic or religious criteria, generational relations, sexual conducts, etc. – all norms which ostensibly seem without relation to the norms of economic exploitation. But these norms are sources at once of objective representations and modes of subjectification, so that the conflicts thus displaced onto the cultural terrain pose in turn sundry problems for the State (Deleuze and Guattari 1983: 257–8).

2. *Autonomy of minoritarian struggles*

This difference between proletariat and minorities is not only theoretical. It has as a practical correlate the renouncement of a presupposition put forward in Marxism since *The Communist Manifesto*: the idea of a trend towards simplification of the antagonism supposed to oppose, increasingly clearly and inevitably, 'two great diametrically opposite classes', bourgeois and proletarian.[4] If the notion of minorities reactivates for Deleuze and Guattari the problem of the relation between the capitalist social machine and the politicising of forces capable of shattering it, this very notion does not at all seem to guarantee a unified base, or a potentially unifiable subject, such as an objectively determinable class in which the possibility of a collective awareness and the work of its political construction could be localised. This is a difficulty which is above all political, and is the correlate of the one just mentioned which expressed (and constantly risked being concealed by) the thesis of the underlying simplification of the antagonism of the two social classes. In a way, this thesis clearly expressed the necessity of the construction of a proletarian politics outside of the State-form, while worker struggles forced the bourgeoisie to be recomposed as a class inside of the State. And yet, this thesis simultaneously tended to misjudge that same necessity. Indeed, complemented in Marxism by an underestimation of capitalism's inventiveness and the suppleness of institutional and State frameworks capable of developing the capitalist relations of production, it led to the conception of the relevant theoretical and practical problems as fated to be spontaneously

resolved by the infallible historic evolution of the mode of production.[5] These problems are those of an autonomous politics of revolutionary movement, that is to say, the invention of original forms of organisation, but also of culture, thought and practices, capable of maintaining the asymmetrical character of conflict, and thus of creating within the revolutionary process the immanent conditions of a politics which would not be modelled on the forms of bourgeois politics or the practices of capitalist State power. Not only do minoritarian struggles encounter in turn this problem of the political autonomy of the revolutionary movement, but they confront it in an even more direct fashion, precisely because the minoritarian sets are immediately constituted in the State-form.

> The power of minority, of particularity, finds its figure or its universal consciousness in the proletariat. But as long as the working class defines itself by an acquired status, or even by a theoretically conquered State, it appears only as 'capital', a part of capital (variable capital), and does not leave *the plan(e) of capital*. At best, the plan(e) becomes bureaucratic. On the other hand, it is by leaving the plan(e) of capital, and never ceasing to leave it, that a mass becomes increasingly revolutionary. (Deleuze and Guattari 1987: 472)

The problem of the political autonomy of a new revolutionary movement is even more crucial for Deleuze and Guattari, since it condenses their evaluation of the ambivalent success of the worker movement. On the one hand, it succeeded in imposing a class duality and social antagonisms which brought the proletariat out of its state of minority, in the specific sense of a subsystem integrated into the new 'industrial system', as the Saint-Simonians would say. On the other hand, it proved itself less and less capable of calling into question its own class identity (and its 'universal class' identity, destining it to establish a transitional new hegemony), whereas the political and union apparatuses, which were supposed to materially incarnate it, tended to be incorporated into the State-form as organs of conflict regulation within the social State, or as 'driving belts' within the domination of a totalitarian bureaucracy (Deleuze and Guattari 1983: 255–7). This is the source of Deleuze and Guattari's suspicion regarding the struggles of minorities internal to institutional, juridical and political structures of the State, and the reason for their insistent criticism of the aim of conquering the majority as a 'simple' displacement of hegemony.[6] In the first part of this assessment, they seem to reactivate familiar critiques of Parliamentarianism and reformism. In the second part, they seem to replay a vague libertarian

impulse. The Deleuzo-Guattarian analysis is, however, more complex because it engages the internal contradictions of the modern State: this latter develops within its national framework the capitalistic relations of production; but these relations are made necessary through an enlarged accumulation and reproduction process, which passes through a worldwide division of labour and a transnationalisation of capital movements. As simultaneously instruments of capital valorisation and the management of systematic disequilibria and crises, the State institutions concentrate within themselves all the contradictions of the process of accumulation. They also negotiate for better or for worse its social repercussions according to both the degree of socialisation of their political, economic and juridical apparatuses and the level of corresponding social struggles. For as much as the minoritarian sets are themselves taken up in the variable combinations of institutional integration and repression, and for as much as they take part in these contradictions internal to the State, their struggles cannot fail to take place inside of it. 'Their tactics necessarily go that route', at the most diverse levels: 'women's struggle for the vote, for abortion, for jobs; the struggle of the regions for autonomy; the struggle of the Third World; the struggle of the oppressed masses and minorities in the East or West' (Deleuze and Guattari 1987: 471). And what is more, these struggles inside of the juridical, political and economic institutions of States are not only tactically inevitable but strategically necessary. They are necessary to generate pressure and to influence the conditions in which the State develops within its own order the relations of production of global capitalist accumulation. This runs contrary to the mystifying representation of a capitalist system which simply and purely transcends States. These struggles interior to the institutions of the State are necessary to exacerbate the distance between the constraints of global accumulation and the impotence of States to 'regulate' their repercussions, whether those be economic, social, cultural, ecological, etc. This in turn runs contrary to the no less mystifying representation of an omnipotent technocracy (such a representation contributes to the simplifying reduction of every struggle within the State to a '*récupération*' which could only be avoided through some isolated regional struggles renouncing all global strategy and all exterior support) (Deleuze and Parnet 1987: 145–6; Deleuze and Guattari 1987: 463). But henceforth, in this very movement within the State, these minoritarian struggles reveal themselves simultaneously as 'the index of another, coexistent combat' which, directly or indirectly, puts into question the global capitalist axiomatic itself and the State-form as such.

> It is hard to see what an Amazon-State would be, a women's State, or a State of erratic workers, a State of the 'refusal' of work. If minorities do not constitute viable States culturally, politically, economically, it is because the State-form is not appropriate to them, nor the axiomatic of capital, nor the corresponding culture. We have often seen capitalism maintain and organize inviable States, according to its needs, and for the precise purpose of crushing minorities. The minorities issue is instead that of smashing capitalism, of redefining socialism, of constituting a war machine . . . whose aim is neither the war of extermination nor the peace of generalized terror, but revolutionary movement (the connection of flows, the composition of non-denumerable aggregates, the becoming-minoritarian of everybody/everything). (Deleuze and Guattari 1987: 472–3)

At this second more profound level, according to Deleuze and Guattari, the autonomy of a revolutionary politics of minorities passes primarily through a critique of the two 'cuts' or two boundaries by which the national State codes its social multiplicities. This coding is nothing but the formation of the nation as 'the very operation of a collective subjectification' (Deleuze and Guattari 1987: 456), which minorities always more or less internalise but under necessarily conflicting conditions: a) a national/extra-national boundary, which tends to make of minorities (usually immigrant minorities, but also potentially every minority, whatever their criteria of segregation) interior foreigners; b) an individual/collective boundary, which inscribes in the structure of the 'major' national subjectivity a private–public division which is particularly problematic regarding the subjective position of minorities.[7] The isolation and thus the 'communitarianisation' of minoritarian struggles proceed through these two boundaries. They form the double bind of a State strategy of differential and unequal integration into the national community and identity. They permit the State to confine their demands to the private sphere as only relevant to strictly individual problems, or else to tolerate their collective impact and political significance on the condition that they do not begin to connect to international coordinates or other exterior minoritarian sets. If the actual becoming of the world determines the emergence of 'a universal figure of minoritarian consciousness as the becoming of everybody', it is not by conquering the majority that this is accomplished. Neither is it realised by burying oneself inside of one's minority, one's particularism, which is only a breeding ground for marginalism. 'It is certainly not by using a minor language as a dialect, by regionalizing or ghettoizing, that one becomes revolutionary; rather, by using a number of minority elements, by connecting, conjugating them, one invents a specific, unforeseen,

autonomous becoming' (Deleuze and Guattari 1987: 106) – a becoming which then passes necessarily through transversal connections between various struggles, in a national and international space. This is a strategic line and a criterion of evaluation. Minorities are certainly not revolutionary in themselves. But the problem remains that of an evaluation immanent to the very struggles they engage in, to the practical 'style' of these struggles, to the modes of existence which they suppose, to the problems which they enunciate and the demands which they make (or to the utterances which they more or less consciously interiorise). The base criterion of such an evaluation is their variable aptitude to join with other struggles, to connect their problems to others which may be very different regarding interests and group identities – 'a constructivism, a "diagrammatism", operating by the determination of the conditions of the problem and by transversal links between problems: it opposes both the automation of the capitalist axioms and bureaucratic programming' (Deleuze and Guattari 1987: 473). In all these ways, the true effect of minoritarian struggles in the actual conjuncture – namely at the moment when Deleuze can affirm that 'our age is becoming that of minorities' and that this tendency of the present reopens 'the question of the becoming-revolutionary of people, at every level, in every place' – is not communitarianism, according to an already republicanised conception of minorities throughout a universal incarnated in the *État de droit* or the Rule of law. It is rather a new internationalism which excludes the State-form. Its task would be to construct a 'minoritarian universal' that would express both practices of universality which are more effectively real than the universality of the national-capitalist State, and a composition of power at least as powerful, confronted with the capitalist system, as the historic worker movement.

3. The minoritarian universal within the becoming-revolutionary

How are we to understand such a universal, 'the minoritarian becoming as universal figure of consciousness?' At the very least, the revolutionary workers' movement could claim, even at the price of countless self-delusions, a real underlying universality, correlative with the historic movement of the concentration of capital resuscitating from itself its most profound negativity: a new collective subject, a bringer of a universal interest, a precursor of a society itself universal, liberated from private property as principle of particularisation and antagonistic division of the social field. We mean, of course, a society without class. What remains certain is that the minorities must not only

surmount their own particularisms, but shatter the previously mentioned double boundary, being both interior (private/public) and exterior (national/international), which allows the functioning of the national coding of minoritarian sets. But this task does not consist, for Deleuze, in renouncing the element of the 'particular'. This element in fact remains crucial in order to valorise a mode of formulation of social, economic and political problems that is capable of thwarting their bureaucratic administration by the State.[8] But this prevents at the same time the projection of a unification of the minorities into the identity of a collective subject – whatever name one gives it, classical (people), modern (proletariat), postmodern or again classical (multitude)... How then are we to conceive of a 'minoritarian universal' which would be constructed by and within a revolutionary process taking up the contradictions of the actual capitalist world, and that yet does not entertain the fantasy of the messianic universality of a new subject?

Such is ultimately the problem condensed by the Deleuzian formulation of a system of domination resting upon, and reproducing itself through, the distinction majority/minorities. Recall that this formulation takes place within a semiology of collective identities, that is to say, within a questioning regarding the logical and semiotic operations by which are distributed social states defined by rules of identity assignations of individuals and groups, rules of categorisation of their conducts and utterances, or in sum, by norms of disjunctive inscription (Pierre Bourdieu would say 'distinction') of social multiplicities:

> Majority assumes a state of power and domination, not the other way around... A determination different from that of the constant will therefore be considered minoritarian, by nature and regardless of number, in other words, a subsystem or an outsystem... But at this point, everything is reversed. For the majority, in so far as it is analytically included in the abstract standard, is never anybody, it is always Nobody – Ulysses – whereas the minority is the becoming of everybody, one's potential becoming to the extent that one deviates from the model. There is a majoritarian 'fact,' but it is the analytic fact of Nobody, as opposed to the becoming-minoritarian of everybody. That is why we must distinguish between: the majoritarian as a constant and homogeneous system; minorities as subsystems; and the minoritarian as a potential, creative and created, becoming. (Deleuze and Guattari 1987: 105–6)

It obviously follows that the majority has a content, since it is constructed precisely by the hegemonisation of particular contents corresponding to a given state of domination. If the majority defines an empty universal, this simply expresses the fact that, once these contents

are raised to dominant norms, these norms themselves seem constructed less so that everyone will conform to them than to assess those who don't conform to them, and to identify and differentially categorise the distances between them (and not simply between them and the supposed identity fixed by the normative utterance). This is something that Deleuze no doubt picked up from Foucault. The normative utterances do not simply demand an identification or conformity ('normalisation'). They permit the recording of the different manners of behaving in relation to this supposed interpellation (and which one also learns afterward),[9] to identify the different rather than to render it identical, to assess and establish 'deviance' within a reproducible space of distribution of the unequal, and to make of its so-called rectification a means of reproduction of new imputations of deviance. In such an operation of 'inclusive exclusion', the majority is the analytic fact of *Nobody*, while the minority, constituted as a state by this very operation, is the synthetic fact of *some particular people*, whatever their number be, gathered into a subsystem and rendered countable and quantifiable by dominant norms. Plenty of dialectics can henceforth be tied between the universal and the particular in such a mechanism.[10] And yet according to Deleuze, the element of conflictuality, at once dynamic factor and immanent principle of an other universality, comes from minoritarian processes which are not defined simply by deviances, but by their non-coded or unregulated character in the game of differences and differential positions. This is not a sociological extrapolation. It is an attempt at making way, within social theory, for a non-categorisable reality which prevents the objective representation from closing itself off, or furthermore (and this is effectively the same thing), which prevents the social system from coinciding with the structure of disjunctive relations which make of it a system of differential positions. Between the positions, there are still subjective transpositional processes which are entirely liveable and thinkable; between the identitary states, there are always objective becomings which are positively knowable and feasible. What is essential thus has to do with the specific effectiveness of such processes. They work simultaneously against the empty universal of the hegemonic norm and against the particularisation inclusive-excluding of minority as subsystem. At the very least they can attain this double efficiency if determined assemblages succeed in carrying out their practical appropriation. Such are these 'minor' practices of which Kafka had presented an example on the plane of literary enunciation. These practices occupy a position of minority to weaken from the interior the majority's normative constants, but they simultaneously lead this

minority itself into a transformation which frees it from its state as subsystem. And such a transformation does not abolish its 'deviance', but rather renders it dissipative, or undetectable, not assessable by the major rule of the measure of distances and assignation of unequal identities.[11] This is why Deleuze writes that even a minority has to become-minoritarian ('it certainly takes more than a state') at the same time as it forms the 'agent' or the 'active medium' through which a subject 'enters a becoming-minoritarian that rends him from his major identity'. As an active medium, minority thus becomes a vanishing mediator within 'two simultaneous movements, one by which a term (the subject) is withdrawn from the majority, and another by which a term (the medium or agent) rises up from the minority. There is an asymmetrical and indissociable block of becoming, a block of alliance' (Deleuze and Guattari 1987: 291).

Supposing it is through the multiplication of these double becomings that the 'becoming-minoritarian of everyone' can be constructed (that is to say, through a universal process which involves no gushing spontaneity of 'Life' or 'History'), perhaps this point only remains obscure because of two theoretical errors which compromise the politics of minorities in Deleuze. And these are two political errors precisely because they result from an overly 'theoretical', or even ontologising, vision of Deleuzian thought. The first is when one speculates abstractly upon 'the' becoming, outside of the couplings of always contextualised becomings which make of them problems of collective experimentation capable of rendering identity positions *in reality* abstract. The second is the error of (theoretically) making of the multiple a given, in being or in a transcendental structure, while it is (practically) only effectively constructed by these dynamic couplings, in these connections of asymmetrical becomings. 'Before being, there is politics' (Deleuze and Guattari 1987: 203), since before ontology, there is strategy. It is the constructions of alliances which decide both the type of multiplicity which one promotes and the practices of identity which one invents or reproduces. Certainly then we must give up the assumption that a collective consciousness could only have as possible content a common identity (be that identity of 'objective interests', problems or conditions), to accede to a universal consciousness having for content a community of becomings, that is to say, of interdependent transformations capable of modifying in their turn the very form of the universal. Then we must consider a universality of a process of relational inventions, and not of an identity of subsumption; a universality which is not projected forward in a maximum of identitary integration, but which is

programmed and reshuffled in a maximum of transversal connections between heterogeneous systems; rather than a socio-logical universal as genre, category or class, a tactical and strategic universal as an indefinite dynamic system of practices of alliance, where the alliance proceeds neither through integration of terms into a superior identity that homogenises them, nor through mutual reinforcement of differential identities, but through the blocks of asymmetrical becomings where a term may become-other thanks to the becoming-other of another term itself connected to an *nth* in an open series. In short, no longer an extensive and quantifiable universality, but on the contrary an intensive and unquantifiable universality, in the sense that subjects become in common in a process where their identitary anchorages are dissipated, to the advantage of that conception and radically constructivist practice of autonomy required by a new minoritarian internationalism. 'Minorities from all countries. . . '

It is not entirely contingent, historically speaking, that Deleuze comes to occupy a position of minority in the political theory of the 1970s, when the revolutionary workers' movement tends increasingly clearly to lose its major position through various struggles against the capitalist system. The way proposed here was not a proposition to 'Marxianise' the Deleuzian theory of minorities, but to suggest rather that this theory produces a double effect of interpellation, upon the reading of Deleuzian philosophy as well as the theoretical and political heritage of Marxism – and that, in pushing Marxism to (re)become 'minoritarian', Deleuzian thought itself is disposed to become political and thus to produce real effects.

Notes

1. See Arendt (2004: chap. 5).
2. See for example the analysis of the becomings in which Kafkaesque novels carry their conjugal and bureaucratic duos away, their bureaucratic and family trios . . . in chapters 6 and 7 of *Kafka: Toward a Minor Literature*. On the deformations undergone by the German of Prague, in semantic and syntactic as well as phonetic levels, see also Wagenbach (1967: 77–82).
3. 'Because collective or national consciousness is "often inactive in external life and always in the process of break-down," literature finds itself positively charged with the role and function of collective, and even revolutionary, enunciation. It is literature that produces an active solidarity in spite of skepticism; and if the writer is in the margins or completely outside his or her fragile community, this situation allows the writer all the more the possibility to express another possible community and to forge the means for another consciousness and another sensibility' (Deleuze and Guattari 1986: 17).

4. This thesis is in the heart of the first chapter of *The Communist Manifesto*.
5. On these questions, we must recall the decisive analyses of Etienne Balibar in *La Crainte des masses*, the chapters 'La relève de l'idéalisme' and 'Le prolétariat insaisissable' (Balibar 1997).
6. 'The response of the States, or of the axiomatic, may obviously be to accord the minorities regional or federal or statutory autonomy, in short, to add axioms. But this is not the problem: this operation consists only in translating the minorities into denumerable sets or subsets, which would enter as elements into the majority, which could be counted among the majority. The same applies for a status accorded to women, young people, erratic workers, etc.' (Deleuze and Guattari 1987: 470).
7. A sign of minority is precisely this impossibility, or the extreme difficulties objective as well as subjective, in interiorising the partition between individual and collective dimensions. Precisely because the 'minor' subject is in an unstable, marginal or precarious state in relation to the conditions of life and to the rights of the majority, all events that come for the 'major' subjects within the scope of an 'individual concern (familial, marital, and so on) [joined] with other no less individual concerns, the social milieu serving as a mere environment or a background', immediately reach on the contrary, for the 'minor', collective and sociopolitical consequences. (Deleuze and Guattari 1986: 17–8, quoting Kafka: 'What in great [major] literature goes on down below, constituting a not indispensable cellar of the structure, here takes place in the full light of day; what is there a matter of passing interest for a few, here absorbs everyone no less than as a matter of life and death'.)
8. 'However modest the demand, it always constitutes a point that the axiomatic cannot tolerate: when people demand to formulate their problems themselves, and to determine at least the particular conditions under which they can receive a more general solution (hold to the *Particular* as an innovative form)' (Deleuze and Guattari 1987: 471). See also Deleuze and Parnet (1987: 145–6).
9. *Anti-Oedipus* called such an operation 'paralogism of displacement' (see Deleuze and Guattari 1983: 113–5).
10. See for example the evocative reading of Ernesto Laclau proposed by Slavoj Žižek (Žižek 1999: Part II, chap. 4).
11. Deleuze's preface to Guy Hocquenghem, *L'Après-Mai des Faunes*, is absolutely emblematic on this point (Deleuze 2004: 284–8).

Adrian Parr (2008) *Deleuze and Memorial Culture: Desire, Singular Memory, and the Politics of Trauma*, Edinburgh: Edinburgh University Press.

Not the least of the many challenges involved in engaging with Deleuzian thought is the problem of writing about it without re-inscribing the same positivistic model that Deleuze so inimitably subverts. If difference itself grounds a virtual actuality that is also characterised by multiplicity, univocity and pure immanence, then a merely narrative account of our epistemological situation begins to seem like folly, a reductive process that drags Deleuze to a standstill in order to take a snapshot of whatever concept is most relevant to the moment. Surely there must be a better way. But even the most sophisticated approaches can be imprisoned by the linear nature of language or the symbolic order; perhaps this is part of what informed Deleuze's well-known remark to Claire Parnet, that in philosophy 'the aim is not to answer questions, it's to get out, to get out of it' (Deleuze and Parnet 2002: 1). The task then becomes, as Claire Colebrook and others have pointed out, to think transitively: how might it be possible to think actuality, think immanence, think univocity, think desire, think language itself?

These questions imply metaphysical hunger of a sort with which theoretical discourse has been manifestly uncomfortable for several decades. Considered another way, however, they promise new

conceptual schema based on the positive (rather than positivistic) notion of creative and desiring production. The task for those exploring the relationship of Deleuze to cultural issues is not to extend his thought in a straight line, but to swerve or veer into thinking a productive approach to the cultural events that actualise themselves in our time. The process is then less about iconoclasm than it is about permeability: how to theorise a way into a richly layered middle ground that comprises interstices of desire, immanence, virtuality and difference? And how might one do so without simply listing and exploiting some concepts 'given' us by Deleuze? While much has been written on the fairly explicit Deleuzian construction of the pre-personal subject, the implicitly post-personal subject who is actually developing concepts on a page seems to be hypostatised inside the critical text. Nonetheless, three recent books that work brilliantly with or from Deleuzian concepts also illustrate the importance of writing from a flexible, deeply thought, yet actualised subject position.

In *Deleuze and Memorial Culture*, Adrian Parr thinks several sites – architectural and conceptual – that are based on the collective experience of social trauma, including the Vietnam Veterans Memorial, 9/11 news coverage, US military abuses at Abu Ghraib, the Amish shootings, and ground zero. The Holocaust serves aptly as a reference point throughout her text, and she devotes a chapter to its powerful presence in the fractured urban space named Berlin. It is not, of course, that there are only a few narrative choices to make, that all cultural wounds are the same, or even that one is really 'worse' than another. Rather, Parr provides an intimate and agile series of readings that are sustained by the positive desire to think memorials in their unique contexts. A great strength of her work is that she clearly sees the body politic as gendered, organic and ethnic. Memorials are, she remarks, 'utopian memories thinking', and they work to signify the affective disruption that writers of utopian tales usually fail to mention. As such, Parr observes that memorials embody '[a]combination of cultural production and collective traumatic memory that can help us peel back the skin and tissue of repression so as to uncover the utopian demand that memory stirs forth' (3). Thus Parr sets the topography and architecture of memorial sites into motion, but the movement is not linear. She is at pains to point out that, as Bergson and Deleuze suggest, the present is not an *effect* of the past. Rather, the past and present co-exist and alter even as they are actualised into becoming.

Parr's chapter on the Vietnam War Memorial intriguingly deploys the Deleuzian concepts of affect, sensation and percept as well as the

distinction between minoritarian and majoritarian statement (54–75). Perhaps there is no other more powerful example of art overcoming or, more accurately, permeating the superficial emotions of the people to whom it is meant to speak. Parr details the numerous insults hurled by Vietnam veterans and others at the designer, Maya Lin Ying, when they saw the design for the memorial. The diatribe, however, was wholly derived from majoritarian narratives about wars, heroes, world communism and reflected glory. Remarkably, it is not political or social pressure that has changed the outlook of most veterans towards the memorial, it is Lin's dynamic re-reading of the area as an architectural and topographical machine for generating blocks of sensation and affect. Parr's illuminating and sure-footed analysis of this situation maps the majoritarian discourse onto Lin's gendered, ethnic and political body. Being young (still a student at Yale), a non-veteran, a woman and an Asian ultimately enabled Lin to find a line of flight from the vertical and static textuality that normally constitutes war memorials, thus leading to a deterritorialisation of the veterans' formerly monolithic position and the creation of a 'minor memorial' (69). This deterritorialisation did not emerge in order to deny or undermine the soldiers' collective memory of trauma in Vietnam, but to release it (68–72). One might add that no better testimony to the potency of Lin's work exists than the veterans' re-naming of the Vietnam War Memorial as 'The Wall', a productively reterritorialised marker for a war memorial that has, against all odds, become a multiplicity.

The attempt to theorise a middle ground takes on extra intricacy when large abstract categories are involved. In particular, Deleuzian thought highlights the limits and prevarications inherent in the molar structures that impose themselves on everyday life. Nonetheless, in *Capitalism and Christianity, American Style*, William E. Connolly essays the task of synthesising certain internal forces in such disparate institutions as democracy, capitalism, Christianity, secularism and the news media. Connolly carefully but creatively transforms the Deleuzian concept of the resonance machine in order to mobilise nuanced tensions and influences, and he writes with a refreshing intellectual integrity. Thus he points out that his description of a capitalist-evangelical resonance machine does not issue from some imaginary pose of neutrality. Connolly remarks that descriptive comments, including his own, already contain the seeds of an agenda. For Deleuze and Guattari this was surely true, because the resonance machine they explicate in *A Thousand Plateaus* is an instrument of fascism. Connolly therefore envisions a new resonance machine tuned to twenty-first-century progressive politics.

Whether such an assemblage can disassociate itself from the black holes of micro-fascisms that have been elided by post-Nazi discourse is a real question. However, Connolly does not seem to duck this problem; he simply appropriates the part of the theory that he needs without specifically contradicting the rest.

Pausing briefly to point out that the word 'resonance' is no more metaphorical than any other term used for political critique, Connolly lists some of the components that align themselves in order to resonate within the right-wing of North American politics. These include, but are not limited to, Fox News, most segments of the financial markets, the Republican Party, evangelical/fundamentalist Christianity, the Book of Revelation, and the Bush Whitehouse. While he condemns the *ressentiment* infused by the right-wing hermeneutic of the Book of Revelation, Connolly makes distinctions with a fine deliberation: he notes that Jimmy Carter is an evangelical Christian for whom 'the vengeful sensibility is alien' (52). If anything, one almost feels sorry for hyper-conservative televangelist Pat Robertson, whom Connolly puts to rout by arraying against him Spinoza, Weber and Nietzsche. The evangelicals are not the only ones capable of conjuring voices from a whirlwind.

For students interested in Deleuzian identity formation, the most interesting part of the book will perhaps be Connolly's deeply felt essay on the possibilities of Meliorism and tragic vision. Here he orchestrates a triple polyphony of Deleuze, William James and Nietzsche. Only James, he notes, draws back from sounding a tragic chord when it comes to the concept of progress, and James' brand of Meliorism depends on a personal struggle to square faith with a philosophy of transcendence. Connolly observes that both James and Deleuze formulate a limited god, but that Deleuze's signal contribution is belief in radical immanence. 'Deleuze', writes Connolly, 'experiments in those fugitive junctures during which tradition encounters the real uncertainty of twists and turns in the making' (131). To Deleuzian immanence Connolly ascribes an incomplete or disrupted mysticism, and it is this reading that allows Connolly to characterise his personal position on Christianity as 'Jamesleuzian' (133).

Alexander García Düttmann's *Philosophy of Exaggeration* begins with a textual experiment that situates the post-personal subject of the author (or possibly a persona) in counterpoint with his more traditional philosophical writing. Thus, even as the book's main text states that 'deconstruction recognises in its object, justice for example, an intrinsic exaggeration that does not even permit one to speak of a recognisable

object', a text box at the top of the same page asks, 'is my incensed exaggeration a weakness of temperament, an affliction, or is it precisely that which protects me from decrepitude and annihilation' (3)? The immediate temptation is to regard the line of thought in the text boxes as more personal, or perhaps more elemental, than the rest of the words on the page, but quite possibly the inverse obtains. After all, the first-person narrative is about what the 'I' or Ego can know or wonder, while the putatively more objective third-person academic discourse is engaged primarily, in this case, with making fine distinctions about imbricated exaggeration and *aporia*. I would aver that the voice in the text box knows far less about the 'internal' workings of exaggeration, as a mode of doing philosophy, than does the voice on the main page. And there are other moments in which percepts shift, most notably in a brief confessional about the narrator's visit to a sex club (26–7). This latter passage serves to complicate the book's production of corporeal affect, which soon reappears in the chapter entitled 'Odd Moves', itself a sophisticated and ironic recital of the difficulties inherent in being a professor right after 9/11. Düttmann's method here is to reframe the remarks of a literary critic to her college class in Manhattan a week after 9/11, one of her students having taken notes and later put them on the web. What follows is a devastatingly accurate satire on postmodernism as a sort of séance, with the anonymous professor playing the role of Madame Blavatsky or the Cumaean Sybil, or both. The class begins with the professor ringing a small bell, which Düttmann tells us is like an invocation of the spirits. The professor then informs the class that language itself is inadequate except to perform meaning or understanding when everything is shattered and disconnected. She gives the class aphorisms, such as 'understanding understands only itself' (42–3). The professorial mystic communicates by telephone with disembodied spirits (Derrida, Hélène Cixous and Jean-Luc Nancy) and reports to the class that 'A lot of energy is coming here. A lot of language failure' (43). This role of poststructuralist as servant of a secret fire will perhaps be not unfamiliar to those who have tried giving a paper on Deleuze as part of their local faculty lecture series, although there it is usually a perception of the audience, not honest Deleuzian affect.

Düttmann's writing displays his easy familiarity with every corner of twenty-first-century philosophical discourse. Beginning with his axiom that justifying an exaggeration thereby causes it to lose its exaggerated status, he follows the twisting and turnings of exaggeration, its implications and inclinations, its limits and liminalities. Drawing attention to his complicity with Deleuze early on, Düttmann sketches

the Deleuzian project of exaggeration as a method of pitting crowned anarchy against the familiar 'image of thought'. Doing so requires excision from the totalising requirement of 'clarity' that characterises everyday opinion as well as some academic discourse. *Difference and Repetition*, for example, shows that comprehensive explication is radically counterproductive. For Deleuze, writes Düttmann, 'explanation without remainder and exhaustive interpretation integrate difference in a determinate and articulated system only at the price of its annulment' (6). This thought sorts agreeably with something that is well-known to students of Deleuze and Guattari: even in a philosophy of pure immanence and radical difference, a small amount of molecular order and subjectification is necessary in order to avoid collapse into an infinite regression of difference. Therefore, the idea is to follow becomings, de-subjectifications, lines of flight, and deterritorialisations without immediately abandoning the subject to the *end* of becoming, which would be solidification into a fact.

It is in this context, then, that Düttmann adduces the importance that Deleuze and Guattari place on utopian narrative. The concept of utopia is deeply implicated in revolutionary politics, and revolution is immanent, as opposed to being an occasional disruption. Utopian discourse takes place 'in a field of forces constituted by exaggerations ... in which there is no solidification that would not harbour a becoming, and no becoming that would not harbour solidification' (72). The idea of utopia is thus trapped between two poles, although there remain various ways 'to get out, to get out of it'. One way is via the utopian memory and affect explored by Parr, and another would be to proceed according to Connolly's opportunistic Meliorism. Yet a third way consists in Düttmann's method of using exaggeration and irony to break utopian critique on the wheel of its own institutional and traditional status. The virtue of these three books, then, is that they do not simply go back to the same old questions; all of them represent departures in the best sense of the word.

What Concepts Do: Preface to the Chinese Translation of *A Thousand Plateaus*

Brian Massumi Université de Montréal, Montréal

Abstract

This essay suggests an approach to the reading of Deleuze and Guattari's *A Thousand Plateaus*, grasped as a philosophical event that is as directly pragmatic as it is abstract and speculative. A series of key Deleuzo-Guattarian concepts (in particular, multiplicity, minority and double becoming) are staged from the angle of philosophy's relation to its disciplinary outside. These concepts are then transferred to the relation between the authors' philosophical lineage and the new cultural outside into which the Chinese translation will propel their thought. Emphasis is placed on the writing – and reading – of philosophy as a creative act of collective import and ethical force.

Keywords: Gilles Deleuze, Félix Guattari, speculative pragmatism, minority, becoming

> 'Philosophy, nothing but philosophy'.[1] (Deleuze 2007a: 176/163, trans. mod.)

That was Gilles Deleuze's simple answer. The question – what kind of book is *A Thousand Plateaus*? – has likely occurred to many a reader upon opening the book. It is clear at a glance that something is going on. Each chapter heading bears a date as well as a title, and is accompanied by an image. The images, the reader quickly senses, are not directly illustrative. What connection, for example, does a diagram of a partridge hunting device have to do with the theory of the State and its relation to capitalism (plateau 13)? Or a line-drawing of an egg to the nature of the human body (plateau 6)? The suspicion that Deleuze's answer is not as simple as it seems is reinforced by a brief introductory authors' note informing the reader that the book is not divided into chapters at all

but is instead composed of 'plateaus'. The difference is that plateaus can be read in any order. Each plateau threads a sinuous weave of topics related to many disciplines other than philosophy: art, mathematics, geology, biology, linguistics, anthropology, history, ethology, literature, music, religion, political theory, economics. The breadth and diversity seem unbounded. The reader is led to a cliff-edge of bewilderment. Suddenly connections leap out, often between disparate passages in different plateaus, like conceptual flashes of lightning joining earth and sky, briefly illuminating a vista with a clarity at once too intense and too fleeting to hold. The flash connections-at-a-distance multiply at each reading, launching the weave of topics into a performative rhythm. Written not unlike a work of experimental fiction, the book reads with the feel of music: in movements. Resonances build at each 'playing', enriching the experience with a self-enhancing sense of variation. Didn't Deleuze once comment that a book should be read as one listens to a record (Deleuze and Parnet 1987: 13/10)? Another complication: the very first line of the first plateau announces a duet. Every passage was integrally co-authored, and 'since each of us was several, there was already quite a crowd'.

Deleuze's co-multiple, Félix Guattari, was not a philosopher by profession. He was a lifelong political activist and a trained psychoanalyst – who never belonged to a political party, and never practised as an analyst. He agitated tirelessly in the extra-parliamentary left that would explode into view with the worker–student revolt of May 1968, energising the social movements that would characterise the following decades. Guattari worked for his entire career at an experimental psychiatric clinic, La Borde, which was allied to the *anti*-psychiatry movement. Guattari's life, Deleuze writes, was itself a rhythm of perpetual movement, uncontainable by any set ideology, disciplinary enclosure or established institution. 'He can leap from one activity to another, he sleeps little, travels much, and does not stop'. His life is like a 'sea', 'always mobile in appearance, with constant flashes of light' (Deleuze 2007b: 237/218 trans. mod.). Earth, sky, sea. Flash, rhythm, resonance. 'Nothing but philosophy', it seems, is made of many things. 'Forces, events, motions and sources of movement, winds, typhoons, diseases, places and moments' (Deleuze 1995a: 34/52). Everything but an interiority of thought. 'Philosophy is not made to reflect on anything … Nobody needs philosophy to reflect' (Deleuze 2007c: 318/292 trans. mod.). A book of philosophy is 'in a relation with the outside'. Philosophical thought 'exists only through the outside and

on the outside' (Deleuze and Guattari 1987: 4/10). 'It's not in the head' (Deleuze 1995b: 134/183 trans. mod.).

Philosophy, for Deleuze and Guattari, is a way of engaging with the world. Speaking for both co-authors, Deleuze remarks that in *A Thousand Plateaus* 'we have the impression we are doing politics. ... The question is whether other people can make use of the work it does, even just a little, in their life and projects' (Deleuze 2007a: 180/166 trans. mod.). Philosophy engages with the world in a way that is as political as it is musical. Its politics is pragmatic, not programmatic. Rather than directing, it donates. It gives a gift of potential for use in other people's lives and projects. Philosophy is a doing, and it acts for change.

This is why philosophy cannot be content to reflect, pronouncing upon the world from a disengaged posture of explanatory description or judgmental prescription. To contribute to change is to herald the new. The new, by definition, cannot be described, having yet to arrive. If its arrival can have been pre-described, it will not have been new. It will have been programmed in the present as a prescription for the future. Philosophy as Deleuze and Guattari practise it is neither descriptive nor prescriptive. It is constructive. 'Everybody knows that philosophy deals with concepts. ... But concepts don't turn up ready-made, and they don't preexist: you have to invent, create concepts, and this involves just as much creation and invention as you find in art' (Deleuze 1995a: 32/48). Philosophy has but one object: the crafting of concepts. 'Nothing but philosophy' is a conceptual art.

Deleuze and Guattari's approach to philosophy has important consequences for how the reader may best approach the experience of *A Thousand Plateaus*. It bears directly on the status of the non-philosophical disciplines from which the authors draw much of their material for the book. The authors do not appeal to other disciplines for outside authority. That is not at all what they mean by philosophy being in relation with an outside. Neither is it a question of setting up philosophy as a judge or outside arbiter of other modes of thought and action. There is an evaluation involved in the activity of philosophy, but it is of a different kind. Each discipline is credited as having its own mode of construction, for which it invents its own self-policing criteria of judgement. Philosophy does not presume to instruct other disciplines in their own affairs. It does not confirm or deny the validity of their results relative to their own sphere of activity. Nor does it simply import their results into its own activity, taking them on board with

borrowed authority. Rather than lay judgement upon other disciplines, or kneel down before their judgement, philosophy takes something for itself from them. It extracts something from their outside activity, which it then artfully goes about making its own. What it extracts, from non-philosophy, is philosophical *potential*. It applies its art to recrafting the potential, recasting it to lead in directions it could never have gone in had it stayed where it started. Philosophy *frees* potential from the captivity of disciplinary self-policing. It does this in the interests of passing the potential forward, to other lives, for other projects. Deleuze and Guattari's philosophy helps itself to the potential of other disciplines. More than one discipline at a time. The potentials it extracts from each enter into proximity with those of others. Together, they enter a weave and a rhythm. Philosophy performs this feat following its own criteria of *mutual inclusion*. It is not just anything goes. This artful inclusion of the otherwise disparate in a mutuality of conceptual movement requires great craft and much sobriety.

Loosed upon the world again, the proximities philosophy has produced translate into a complex network of potential passages *between* spheres of activity at work in the world, including but not limited to the disciplines from which potential was originally mined. From these 'transversal' connections something as yet unseen may arise: a new synthesis. What philosophy takes, it gives back, with a difference. Deleuze and Guattari call this freeing of travelling potential for making a difference in the world 'deterritorialisation'.

This is what philosophy is all about for Deleuze and Guattari. Not reflection, description, prescription or judgement. Philosophy is about new potential coming together, between activities which in the normal course of their affairs tend judgmentally to sequester themselves and jealously hold to their own. The object of philosophy is not things as they are, but things as they potentially come-between, to become-together, outside of their normal conditions of captivity. The meaning of a philosophical concept cannot be reduced to its semantic content, defined in abstraction from this process. There is a transformational aspect to the concept's letting loose, by which it effectively overspills its own definition. This is the aspect of what philosophy comes to *do* in the world: its pragmatic aspect. It is the processual aspect of the concept's moving on, to new effect. The concept's meaning cannot be abstracted from its flow-over effects. Its meaning is one with the movement of its taking excess effect. In addition to the semantic meaning that it can be defined to contain, a philosophical concept carries a surplus of meaning that is one with the transformative movement of its performative *force*.

Philosophy is doubly engaged with non-philosophy. It needs existing realms of non-philosophical activity from which to extract the potential it makes its own; and it needs becoming realms of non-philosophical activity to which to pass on its own potential, to inclusive new effect. It needs the wideness of a participatory world to gear into. Philosophy gears its activity to the potential of existing domains of activity, approached from the angle of how they can move together and change together. It is all about relation. Relation is all about co-variation.

To get the most out of the book, readers of *A Thousand Plateaus* must be willing to open themselves to the book's performance of conceptual forces. Nothing, but nothing, comes of philosophy, unless its pragmatic sweep is allowed to wash through the reading experience. What this 'means' for the reader will co-vary. Only one thing is sure. It means taking the risk that the movement of philosophy will pass into your life and projects next, to new and unpredictable effect. True thought, said like-minded philosopher A. N. Whitehead, is truly an adventure. If the thought of adventure is not already a pleasure, the reader is well-advised to go elsewhere. There are any number of less becoming thought practices on offer.

It was probably clear from the first lines of this preface that a chief concern for Deleuze and Guattari is *multiplicity*: many disciplines, many plateaus, many rhythms, multiple subjects, co-varying travellings. Philosophy, as it came to be institutionalised as a discipline in the West, is not in fact very adept at processing multiplicity. Quite the opposite, it has developed an arsenal of techniques for turning away from it. Institutional philosophy enjoys subsuming multiplicity to the One of totality. Or compartmentalising it in the Two of duality and opposition. Then, nostalgic for the lost unity it now regrets splitting up, it often labours to overcome the duality that it itself produced, in order to refind the One through a one-two-three of dialectical synthesis.

This is not to say that there are not great thinkers of multiplicity in the history of Western philosophy who resist the romance of the One of totality: Spinoza, Nietzsche, Bergson. It is with thinkers such as these that Deleuze and Guattari ally themselves. Given the accumulated weight of Western philosophy's totalisations, dualisations and triangulations, added assistance is appreciated. So they turn, for example, to mathematics, a discipline that has no choice but to grapple with multiplicity. For what is number, if not the very problem of multiplicity as such? Mathematics will accordingly invent a variety of specialist formal languages for handling multiplicities. Philosophy, not being mathematics, does not need the formalisations. But built into each

formalisation is a concept of multiplicity, constructed to yield specifically mathematical results. Deleuze and Guattari's attitude is that there is no reason in the world why that concept of multiplicity cannot or should not be extracted from its specifically mathematical expression and redeployed in a manner specific to philosophy, so as to generate philosophical results.

For example, Riemann's geometry invents a formalisation of space as a patchwork of regions *all* of which connect at the edges of *each*. Space for Riemann is the continuity *of* the multiple, unreduced to a unity, unsplit, and needing no salvation through triangulation. The *continuity* of this infinite connectivity of the multiple makes the preoccupation with the One simply unnecessary. A displacement has occurred. The problem has changed. Deleuze and Guattari will make use of that displacement for philosophy, taking care to deterritorialise it in relation to its previous institutional incarnations. They will extract from Riemann's mathematical project the properly philosophical concept of 'smooth space' (plateaus 13 and 14). They do this in order to bring to philosophy a new potential for its thinking which alters the problems it encounters. Philosophy's engagement with mathematics does not simply import a mathematical solution from mathematics. It uses a mathematical solution to reproblematise philosophy. In doing so, philosophy challenges itself to invent new solutions proper to its own sphere of activity.[2]

The concept of smooth space is that of a space in which there is the potential to go from any point directly to any other, without passing through intervening points. This raises a series of properly philosophical problems that are beyond the ken of mathematics. Can a body come to *move* in ordinary space in such a way as to *transform* it into a smooth space? Can movement invent its own operative space of infinite connection, freeing itself from the boundaries and limits of already instituted spatial formations? Can movement deterritorialise space itself, to produce a space of a different order? To think these problems Deleuze and Guattari invent the conceptual persona of the 'nomad' as the figure of the embodiment of this transformation, exemplified in history in the ancient societies of the Inner Asian steppes (plateau 12).[3] If it happened once in history that the nomad invented itself as a people by inventing a smooth space of movement, there is no reason why it cannot happen again. The fact that it happened once demonstrates that the potential was there. Once a potential, always a potential. What, Deleuze and Guattari speculate, would be the embodiment of the nomad in our time? What are the present world's peoples to come, already perhaps in the process of self-invention?

Their answer: what we term 'minorities' (plateau 13). They use the word minority in a special philosophical sense. A minority is a human multiplicity that is non-denumerable. It is a human multiplicity in continual flux, such that the individuals composing the multiplicity cannot be counted one by one and placed in recognisable categories. They cannot be attributed a definite identity, nor assigned a normal function. Because they cannot be pinned down, they can move 'smoothly' from any point directly to any other in the territorial landscape of recognised categories and instituted functions. They are in a flux of collective becoming. Their movement makes a Riemannian space of the territoried patchwork of recognised national and local identities and the functioning institutions that contain and regulate their activities. The modern nomad reinvents the 'steppe' for the age of global capitalism. Their movements secrete a smooth space of becoming that is uncontainable within the boundaries of existing identities and unregulated by the economy of their normal channels of circulation. This philosophical concept of a smooth space of collective becoming did in fact pass into other lives and projects. Taken up by elements of the anti-globalisation movement, it contributed in the first years of the twenty-first century to the invention of a new transnational space of anti-capitalist resistance.

A philosophical concept always moves through 'double becomings', and double becomings cascade. Something passes between mathematics and philosophy, such that a construction that was nothing but mathematical becomes philosophical, in a way that changes how philosophy is done. Philosophy itself becomes through that engagement: more capable of thinking multiplicity; more free of the burden of its acquired historical habits. Double becoming between the disciplines of mathematics and philosophy. Cascade: the concept strikes fertile ground in a different domain, that of activist political practice, where it generates flow-on effects that overspill the discipline of philosophy – and of disciplinarity as a model. Extraction, transformation, overspill. This relational development of undisciplined potential is the pragmatic movement of philosophical thought.

It is through this processual engagement with mathematics, and others like it, that Deleuze and Guattari develop what may be considered *the* key concept of the book: multiplicity as a continuity of becoming, uncontained. Other key concepts play out from analogous encounters with different disciplines belonging to the natural sciences, the social sciences, the humanities, anything at all. A reencounter with philosophy's own discipline is of course a crucial part of the

mix. It gives already philosophical concepts the chance to rebecome philosophical and take on new life. It is these conceptual becomings- and rebecomings-philosophical which interweave to form each 'plateau', and which return in a rhythm all their own across plateaus, making a smooth conceptual space of the book itself. A plateau, the authors say, is a region of 'intensity' of a concept's deterritorialised becoming: a particular coming-together of a multiplicity of strategically displaced conceptual movements-between. These movements compose the text. Their composition couches in the text a charge of relational potential that may well move outside again, into non-philosophical spill-over effects.

Each reading of the book is a performative 'mapping' of these movements: a recreative travelling of 'abstract lines' of conceptual potential; a reinventive 'tracing' producing anew the thought-regions it traverses. The book as a dynamic whole is a 'geology' of these regions whose tectonic plates are constantly shifting and folding, and rising under the force of their folding-together to form the apparently stable compositional landmarks called 'plateaus'. The result is a complex 'cartography' of potential becomings of thought, coursing in from the outside of non-philosophy, through philosophy, then back out again in potentialised overspill. Philosophy, practised in this way, is metabolic. It energises. Any non-philosophical domain can provide the nourishment. Deleuze and Guattari are notoriously omnivorous in their sourcings. What would be the point of limiting the energies philosophy may metabolise by preselecting what it can feed on? Philosophy as a discipline – philosophy as it exists institutionally, embodied in specialised university departments – is an ascetic shadow of what it can be. It is philosophy on a starvation diet. It is philosophy that has long ago renounced its symbiotic relation to the outside, restricting its input to the canon of recognised authors over which it claims exclusive ownership rights. This is philosophy feeding on its own. As a direct result of this cannibalism, institutional philosophy suffers from a conceptual nutrient deficiency. It can only regain its energies and rebecome the metabolically creative enterprise it always was – philosophy and nothing but – by adventuring beyond the interiority of its institutional repair and reengaging with the varied life of the world at large.

It is little wonder, then, that the publication of *A Thousand Plateaus*, the great book of the philosophical outside, was at first deafeningly ignored by its own discipline. It is only in the last five years or so that it has been added to the institutional larder. There is still discomfort. There is something institutionally indigestible in its way of

practising philosophy. This is not at all to say that *A Thousand Plateaus* was without effect for its first twenty-five years. It had enormous impact from the start, just not in the institution of philosophy. It was immediately taken up in a panoply of other domains of activity, towards their own creative becomings-between: architecture, literature, dance, cinema, new media and interactive art, experimental music, performance, education, anthropology, international relations, political science, political activism. The list is long, and still growing. The book's conceptual rhythms have struck many a chord.

A warning is in order: there is nothing inherently good or bad in a philosophical concept, or in the creative process it fosters. To return to the concept of smooth space, Deleuze and Guattari underline that the movements producing it are by nature 'war machines' (plateaus 12 and 13). It is not, they explain, that these movements seek conflict, or have war as their object. It is that their uncontained becoming places them in a permanent state of *potential* conflict with territorial orders and the way of life they support. That potential may always be 'captured' by a military institution and rechanneled so that it does take war as its object. The first modern reinvention of nomadism, according to Deleuze and Guattari, was in the arena of maritime warfare, and evolved as an offshoot of the Western powers' colonial hegemony, as it transitioned into the Cold War. More recently, Eyal Weizman has shown how the concept of smooth space was consciously appropriated by the Israeli Defense Forces to reinvent urban warfare for use in their occupation of Palestine, with *A Thousand Plateaus* itself used as an officer training manual (Weizman 2007). The movement of thought metabolised by the creative movement of philosophy is not a priori morally good or bad. Nor is it necessarily right or left in political terms. It has the potential to go either way. This means that it can only be judged on its own terms. Which is to say pragmatically: in its consequences.

Since what effectively follows from a philosophical concept comes with how it is remobilised outside philosophy, the value of a philosophy is always the product of a collaboration. According to William James, a founder of pragmatism, a concept is what it *does*. Its value is the difference it effectively makes in the world. If it looks like a concept, sounds like a concept and even tastes like a concept, but doesn't make a difference in the world, it's not a concept. James's favourite example of a concept which isn't one is, once again, the One itself (James 1996). Nothing can be done with absolute totality. It dissolves into nothingness at the slightest attempt to make something of it. Because then there are two: its lost grandeur, and the slightness of your attempt. Which has

made no difference. One might as well skip the dialectical third step that usually comes next, and just make do with the multiplicity with which the world presented itself in the first place, instead of wasting thought-energy fruitlessly trying to overcome it. That is the more creative option by far.

Deleuze and Guattari emphasise that creatively making-do with multiplicity involves a collective project of becoming. This is the meaning of their frequently repeated formula that the creative force of a concept is 'a people to come' (plateau 11). A people's coming-to-be in outside relation *is* the evaluation of the concept. A conceptual evaluation comes in the form of an event. It is a lived judgement. Deleuze and Guattari name this self-inventive, event-based evaluation 'ethics'. Following Spinoza and Nietzsche, they oppose ethics to morality. Morality is prescriptive. It pre-judges. Ethics unfolds. It makes-do. The ethical value of a philosophical concept is its pragmatic truth. That truth *occurs* to the concept, in the course of its own unfolding process. It is not in the head. Pre-judging the concept makes no difference to its true potential for event. Critiquing a concept in the abstract, standing grandly in judgement outside and above it, does nothing. It leaves the concept unlived, separated from its own event. Deleuze and Guattari advocate instead what they call 'immanent critique'.

An immanent critique acts from within the movement of the problem at hand. It consists in entering the flow, and *acting* within it to infect its course. The ability to do this requires an *experiential* assessment of the direction of the movement and the potential it carries forward. It is in this sense that a truly philosophical evaluation is always, ethically, 'affirmative'. It must begin by actively opening itself to the experience of the problem which concerns it. Participatory concern is its necessary condition. A conceptual movement submits itself to judgement only to the extent to which it awakens concern, taking on 'importance' in the world. And it does this precisely to the extent to which it is collectively felt to make a difference. Deleuze lists the markers of a philosophical concept as the Singular (the event), the New (becoming) and the Important (lived force of consequence). 'Concepts', he says, 'are inseparable from *affects*, by which I mean the powerful effects they have on our life, and from *percepts*, which is to say the new ways of seeing or perceiving they inspire in us' (Deleuze 2007b: 238/163 trans. mod.). Concepts are not abstract. They are for the living, and it is life which judges them.

Another word for a movement which is oriented, in the sense of carrying a certain kind of potential, but is at the same time open-ended in

its consequences, as well as being self-affirming, is a *tendency*. Concepts are always of tendencies. Which means they are always ultimately 'about' their own movement, because they *are* tendencies. Concepts are pragmatically self-referential. This point is especially important understanding how the concepts mobilised in *A Thousand Plateaus* relate to history. Perhaps the most persistent misreading of Deleuze and Guattari's ideas is to think that they *refer* to something outside their own movement: to mistake them for empirical descriptions. This is also not what Deleuze and Guattari mean by philosophy relating to its outside. The historical events and formations Deleuze and Guattari mobilise in such great abundance are not empirical states of things to which philosophical concepts are descriptively applied. Deleuze and Guattari are not concerned with *applying* their philosophy to history, or to anything else. They are interested in letting philosophy loose on the world. What their concepts are 'about' are the tendencies which wash through historical events and sweep historical formations into a movement of becoming, including that of philosophy itself. Tendencies are *transhistorical*. They pass through historical moments, joining them in the continuity of variation that is as much about philosophy as philosophy is about it. The philosophical issue is not, for example, whether the societies of the Inner Asian steppes were or were not nomadic, judging by whatever empirical criteria a historian may wish to apply. Philosophically it is not a question of what they were, but *how* they were: what they did, as concerns becoming.

What they did was to bring a certain transhistorical tendency to expression, to the greatest extent possible, given the conditions. They exemplified a tendency to the highest degree. The function of the dates in the title of each plateau is to mark the arrival in history of a highest-degree expression of a transhistorical tendency. This is not an empirical description, but rather a *speculative* proposition. The proposition is that the tendency will carry forward through history, to find further expression, in equally high-degree variations exemplifying the same tendential movement to the limit of what changing conditions will permit. The philosophical conception of history concerns the movement of a tendency through a *series* of limit-case exemplifications.

The series, in principle, is unending. There could always, potentially, be a next tendential expression. All it takes is a people to come to invent it. The philosophical thinking of history bears on this leftover of creative potential that is in excess over any given expression of it in a given state of things. What philosophy thinks in relation to history is the charge of *futurity* energising the historical present's passing. This is

what philosophy concerns itself with: the 'untimeliness' of the historical moment (Deleuze and Guattari 1987: 296/363). Since the concern is for futurity, philosophy is *speculative*. Speculation is 'superempirical' in the sense that it concerns the empirical overspilling of history by tendency. The best way to 'describe' a tendency is to mobilise it in thought, and take it as far as it can go in thought. Philosophy stages thought-experiments extrapolating movements it finds astir in the world. A tendency is characterised by a certain mode in which a multiplicity of elements come together in becoming and hold together in a dynamic unity of movement that makes a difference in history. This mode of making a difference is what Deleuze and Guattari call an 'assemblage'. An empirical object has *properties* defining *what* it *is*. A tendency has *poles* governing *how* it *goes*. Make a concept for *how* a given multiplicity of elements come together and hold together to make a *difference* in history. Then extrapolate that assemblage to the absolute limit of what it can do, in thought. How would it go, were it to exemplify itself to the highest conceivable degree?

This absolute limit of a highest-degree expression of a tendency is a pole, almost in the magnetic meaning of the term: an attractive force orienting a tendency. The philosophical extrapolation of a tendency is an active diagnosis of this orientation. What is at issue philosophically is never the empirical question of 'what' something is (the question of being). It is the pragmatic question of 'how' things go (the question of becoming-oriented). What is always at issue philosophically is this pragmatic question, taken to the limit of thought (Deleuze 2004: 95–6/132–4). At that limit lies an attractive force that is never exhausted in any particular historical present. Taken to the limit, a movement is in processual excess over any empirically describable instance of its activity. What philosophy extrapolates is this excess, which as such is empirically 'pure'. As a polarity, it is historically empty – and philosophically loaded. Philosophy is the speculative invention of pure experimental thought-forms. It is in these limit-forms that its creativity finds its own highest expression. It is crucial to bear this in mind in thinking about the role of history in Deleuze and Guattari's writing.

'Philosophy', it must not be forgotten, 'is as creative a discipline as any other' (Deleuze 2007c: 318/292). As a creative endeavour, Deleuze and Guattari often emphasise, philosophy is closely allied with art. Repeat: 'you have to create concepts, and this involves just as much creation and invention as you find in art' (Deleuze 1995a: 32/48). Deleuze and Guattari think philosophically in relation to the outside of art and literature as extensively as they do in relation to history,

mathematics or science. One of the reasons they place an image at the beginning of each plateau is to mark this kinship with art, and to suggest that there is a conceptual activity in art itself that can nourish philosophy in a way that is much closer to its own activity than any other of its outsides. The kinship they feel between art and philosophy has to do with the fact that the object of art is also the untimely. Art, like philosophy, looks past 'what' things are, to how they become. It 'looks only at the movements' (Deleuze and Guattari 1987: 282/346). In order to do this, it 'breaks' things as they are 'open', in order to liberate the pure form of their potential, making a tendential event of it (Deleuze 1995c: 86/119). This is a speculative act, a conceptual gesture, in much the same way that a philosophical thinking is. It is also an act of resistance: to the way things are, out of concern for *how* they may become (Deleuze 2007c: 327–9/300–2). Philosophy makes resistance thinkable. Art makes it perceptible (Deleuze and Guattari 1994: 163–99/154–88). They are both, in Guattari's terms, 'ethico-aesthetic' practices of inventive resistance oriented to becoming (Guattari 1995).

The 'artfulness' of philosophical concepts should not be taken to mean that they are unrigorous, merely metaphorical. 'For me', warns Deleuze, 'metaphors do not exist' (Deleuze 2007d: 202/186 trans. mod.). For a philosophical concept to do what it can do best, to the limit of its inventive abilities, it must achieve a pragmatic excess of conceptual precision. It is only with pragmatic precision that things can be made to happen through thought. To make an event of thought is a most rigorous endeavour. Deleuze does not recoil at the word 'system'. A philosophy, for him, must have all the rigour of a complex 'open' system, constitutively open to changing relations of the outside (Deleuze 1995a: 29–34/44–52).

The Chinese translation of *A Thousand Plateaus* is a rigorous thought-event in its own right, 'involving as much creation and invention' as the original. It is only fitting that the Chinese reader, finding this new creation in their hands, treat the translation of their book as Deleuze and Guattari treat every achievement: break it open. Resist its 'being' European. Don't take it as descriptive of where it has come from. And especially don't take it as prescriptive for where it has now arrived. Liberate the pure form of its potential – for Chinese thought, in a continuing of its own singular adventures in becoming-between, coming-together again in a relation to the great outside of its own futurity. Nothing would please Deleuze and Guattari more than their philosophy

taking on a new and untimely importance beyond the limits of 'what' they, as the European thinkers that they were historically, could ever have imagined.

Becoming-Bertha: Virtual Difference and Repetition in Postcolonial 'Writing Back', a Deleuzian Reading of Jean Rhys's *Wide Sargasso Sea*

Lorna Burns University of Glasgow

Abstract

Critical responses to *Wide Sargasso Sea* have seized upon Rhys's novel as an exemplary model of writing back. Looking beyond the actual repetitions which recall Brontë's text, I explore Rhys's novel as an expression of virtual difference and becomings that exemplify Deleuze's three syntheses of time. Elaborating the processes of becoming that Deleuze's third synthesis depicts, Antoinette's fate emerges not as a violence against an original identity. Rather, what the reader witnesses is a series of becomings or masks, some of which are validated, some of which are not, and it is in the rejection of certain masks, forcing Antoinette to become-Bertha, that the greatest violence lies.

Keywords: Gilles Deleuze, Jean Rhys, writing back, becoming, *Wide Sargasso Sea*, virtual, *Difference and Repetition*

Within the postcolonial critic's lexicon, terms such as 'hybridity', 'writing back' and 'creolisation' have come to be associated with a fundamental ambivalence that lies at the heart of the postcolonial project. Indeed, Homi Bhabha's characterisation of the 'location' of the postcolonial moment as a transitory site, 'neither a new horizon, nor a leaving behind of the past' (Bhabha 1994: 1), confirmed radical ambivalence and 'in-betweenness' as the archetypal features of postcolonial resistance: the hybridised subject or creolised text works to undermine colonial authority precisely because it is not easily accommodated into the coloniser's self-assured world-view. In the same way, where postcolonial authors such as Jean Rhys, Derek Walcott, J. M. Coetzee or Aimé Césaire appropriate and rewrite canonical texts,

writing-back to the imperial canon as Bill Ashcroft, Gareth Griffiths and Helen Tiffin (2002: 96) have argued, it is the production of a text that both does and does not resemble the original work that marks its ambivalent status as a hybrid or creolised text. Yet, what has remained understated in contemporary postcolonial criticism is the extent to which both hybridity and creolisation do witness the birth of 'a new horizon'. Rather than locating the revisionary potential of postcolonial aesthetics within an ambivalent hybridity, I contend that it is the overlooked ability to effect the new that distinguishes postcolonial discourse and, crucially, marks its compatibility with the philosophical writings of Gilles Deleuze. Elaborating the distinction that Deleuze in *Difference and Repetition* identifies between the first and third syntheses of time, this essay outlines a Deleuzian approach to postcolonial writing back by drawing on the particular example of Jean Rhys's *Wide Sargasso Sea* and identifying the repetitions of virtual difference and becomings that make Rhys's canonical re-dress a genuinely original literary expression.

At issue in this essay is not simply the question of whether Rhys's novel, or any example of postcolonial writing back, is a new work of literature, but rather, at a more fundamental level, a question of the particular relationship between the postcolonial present and the colonial past enacted in writing back. Indeed, this question is evident in Bhabha's own formulation of the postcolonial moment as neither a 'new horizon' nor the abandonment of historical memory. Despite this suggestion, *The Location of Culture* does not oppose the idea of the postcolonial as the production of the new: Bhabha later defines cultural translation as 'an encounter with "newness" that is not part of the continuum of past and present' (Bhabha 1994: 7), and argues that the hybrid object be recognised as 'new, neither one nor the other' (25). However, it is the concern to define postcolonialism as both the liberation of the subject from the traumatic legacies of colonialism and the care that the past be not forgotten that leads Bhabha to ostensibly reject the horizon of the new. In turn, what is needed to address this concern is an understanding of postcolonialism as a historical relation that gives rise to a newness 'that is not part of the continuum of past and present', but which is, nevertheless, derived from a particular (colonial) history. It is this paradoxical relation in which the engagement with history both generates a future with the potential to become something wholly new and revises our understanding of all that led up to it (a new continuum that leads from past to present and into the future) that Deleuze establishes in his third synthesis of time: articulating a theory of becoming that accounts for the production of the new from a

re-dress of the past and, I argue, when applied to writing back, reveals the revisionary force of postcolonial writing.

The significance of Deleuze's philosophy for postcolonial studies has received little attention to date, with Peter Hallward's *Absolutely Postcolonial* remaining the most comprehensive critique of Deleuze's influence on the field. For Hallward, questions of singularity, specificity and, crucially, locatedness take centre stage in his attack on a Deleuzian postcolonial discourse, arguing that while colonial and counter-colonial discourse may indeed be criticised for their over-specification of the subject, in his view, the postcolonial has moved in precisely the opposite direction, towards a singular reality which 'will operate without criteria external to its operation'; replacing 'the interpretation or representation *of* reality with an immanent participation in its production or creation: in the end, at the limit of "absolute postcoloniality", there will be nothing left, nothing outside itself, to which it could be specific' (Hallward 2001: xii). Implicit in Hallward's argument is the view that postcolonialism tends to follow a logic of immanence or single-substance (Burns 2009: 104–5). As such, everything exists as a particular element within the singular substance that we might term the universe, and is nothing other than a particular configuration of that single-substance. Accordingly, for Hallward, the postcolonial will tend towards the elimination of specific histories, locations or cultures as independent, contextualising forces and, as a result, postcolonial discourse can be regarded as 'more or less enthusiastically committed to an explicitly *deterritorialising* discourse in something close to the Deleuzian sense – a discourse so fragmented, so hybrid, as to deny its constituent elements any sustainable specificity at all' (Hallward 2001: 22).

While Hallward's work does represent a significant and distinct intervention in the field of postcolonial studies, the core logic behind his critique should sound familiar since it echoes precisely the criticism that Hegel levelled against Spinoza's notion of singularity. To recall Hegel's indictment of Spinoza in his *Lectures on the History of Philosophy*, 'the cause of his [Spinoza's] death was consumption, from which he had long been a sufferer; this was in harmony with his system of philosophy, according to which all particularity and individuality pass away in the one substance' (cited in Hardt 1993: 257). For Hegel, as for Hallward, the Spinozist conception of substance and positive (or immanent) differentiation cannot provide a basis for particularity or the specific since it lacks the core feature of determination: dialectical negation. As Michael Hardt argues, 'according to Hegel, the unique and absolute being of Spinozism cannot provide a basis for determination

or difference because it involves no other or limitation' (Hardt 1993: 67). Within a Hegelian ontology, determinate or specific being emerges through the negation of its opposite, nothingness, and it is this opposition between being and nothingness that 'defines the foundation of real differences and qualities' (Hardt 1993: 3). In other words, difference is always produced through a negative movement and each thing exists in its particularity and difference through the active negation of something else. Importantly, this view of difference is echoed in *Absolutely Postcolonial* in which Hallward highlights what he considers to be effective acts of postcolonial resistance, such as the fiction of V. S. Naipaul, in which difference emerges when 'Naipaul puts himself and his characters in a *position* of judgement, as alternatively judge and judged' (Hallward 2001: 332). As a result, Naipaul's work 'is simply specific rather than singular, inflected through the experience of a positioned narrator or character and maintained as a network of [. . .] relationships' (332). In other words, for Hallward difference and specificity are produced negatively through one's situated opposition to an other.

Hallward's claim that the lack of situated opposition or determination in postcolonial literature results in a discourse that, given the absence of negation, cannot sustain real difference and will inevitably dissolve into an undifferentiated nothingness must be recognised for what it is: a contemporary elaboration of Hegel's critique of Spinoza's positive ontology. As such, Hallward's argument faces strong criticism from the philosopher he holds responsible for the singularising nature of postcolonialism: Deleuze. Hardt has shown in detail how Deleuze draws on both Spinoza and, in particular, Bergson to demonstrate that negative determination not only presents a false notion of difference but also, controversially from Hallward's point of view, 'fails to grasp the concreteness and specificity of real being' (Hardt 1993: 4). Put simply, Deleuze elaborates both Bergson and Spinoza to argue that Hegel's concept of negative or dialectical differentiation cannot provide an adequate foundation for being since it depends on external causes, thus introducing contingency and causality into being: to quote Deleuze, 'in Bergson [. . .] the thing differs with itself *first, immediately*. According to Hegel, the thing differs with itself because it differs first of all with all it is not' (cited in Hardt 1993: 7). Hallward's reluctance to fully acknowledge the Hegelian logic behind *Absolutely Postcolonial* results in an argument against postcoloniality and Deleuze that fails to address Deleuze's own ready-made answer to the charge of singularity as well as postcolonial criticism's demand to face the emergence of newness and not just specific instances of located resistance. As a result, his reading rests upon a

critique of differentiation at odds with Deleuze's commitment to an immanentist philosophy. However, by recognising the value of positive differentiation and the shift away from dialectical negation as the foundation of being, a more significant form of postcolonialism emerges based on instances of virtual difference, repetition and becoming-new.[1]

It is this aspect of Deleuze's philosophy that Caribbean writers such as Édouard Glissant and Wilson Harris draw on in their own postcolonial works. Notably, both Glissant and Harris envision the postcolonial project as an engagement with the traumatic history of colonialism that, nevertheless, creates a new, unpredictable future: a 'prophetic vision of the past' (Glissant 1999: 64), for Glissant or in Harris's characteristically opaque prose, 'continuities running out of the mystery of the past into the unknown future yield proportions of originality, proportions of the "genuinely new"' (Harris 1996: 6). The particular engagement with history that both Harris and Glissant propose in their writings represents a shift from what Walcott designated a literature of 'recrimination and despair' (Walcott 1998: 37) which endlessly repeats the biases of colonialism, towards a revisionary postcolonial literature. Wole Soyinka's denunciation of the negritude movement as that which trapped 'itself in what was primarily a defensive role' (Soyinka 1976: 129) and 'stayed within a pre-set system of Eurocentric intellectual analysis both of man and society and tried to re-define the African and his society in those externalised terms' (136) highlights the point of contention: counter-colonial discourse is wholly specified by the colonial context in which it exists, it adheres to the 'pre-set system' in which the black man is cast as the racial other. The postcolonial, on the other hand, while drawn from a particular socio-historic milieu (one marked by the traces of the colonial era), is distinguished by its ability to move beyond the 'defensive role' of counter-colonialism. It is a discourse that exceeds the already established, 'pre-set' value systems that Europe imposed on its colonial others. In other words, postcoloniality denotes a synthesis of the past that does not repeat predetermined attitudes, but creates something new: an original future not determined at the outset by pre-existing socio-historic subject positions or cultural hierarchies, but, nevertheless, specific to those legacies.

I. Expectancy, Stereotypes and the First Synthesis of Time

The distinction that I am arguing for between a historical relation that repeats already established biases and fixed subject-positions and a postcolonial re-dress of history that engenders the absolutely new is

clarified by Deleuze's account of the first and third syntheses of time. As Deleuze presents it in *Difference and Repetition*, the first synthesis of time is a theoretical paradigm that accounts for the continuation of the same and the general. Crucially in terms of the particular relationship to the canon that is enacted in writing back or what Edward Said designates 'contrapuntal' reading (Said 1993: 59), for Deleuze the first synthesis is the creation of expectancy through repetition, accounting for the way in which, in the present, we come to anticipate future events because of their past occurrence. For example, the repetition in the series AB, AB, AB, A…, Deleuze argues, 'changes nothing in the object or state of affairs AB. On the other hand, a change is produced in the mind which contemplates: a difference, something new *in* the mind. Whenever A appears, I expect the appearance of B' (Deleuze 2004: 90). In this 'contraction' of specific instances of 'A' and 'B' into 'AB', the first synthesis of time produces a movement from the specific to the general (91). Furthermore, the effect of this contraction is to create a sense of expectancy: in this case, the recurring experience of A followed by B is contracted in the present into the projected expectancy that AB will recur in the future.

It is this sense of expectancy that underlies postcolonial authors' problematic relationship with the canon and historical legacies. Following Ashcroft et al., the relationship envisioned here is not between individual authors or works since the 'canon is not a body of texts *per se*, but rather a set of reading practices (the enactment of innumerable individual and community assumptions, for example about genre, about literature, and even about writing)' (Ashcroft et al. 2002: 186). In writing back, postcolonial authors seek to expose not only specific prejudices, expressed in particular cases, but the continuing influence of these views. In Emily Brontë's *Wuthering Heights*, for example, the reader encounters particular references to the colonies and racial others, expressed in a particular way. One might then read Charlotte Brontë's *Jane Eyre* and register a repetition in the way in which both authors depict the relationship between the coloniser and the colonised, a repetition that is echoed as one then reads Austen, Dickens and so forth. It is the repetition of these specific ways of characterising the relationship between centre and periphery that is contracted into what might be termed, in general, as a colonial attitude. Importantly, as Deleuze's account of the first synthesis emphasises, it is not a change in the texts themselves or in that which is repeated, but it is a change in the mind of the reader who registers the repetition. This is why the canon evokes reading practices: the repetition of themes, attitudes or genres in

specific texts are synthesised in the mind to create a general expectancy, a general set of reading practices that will, accordingly, shape future reading experiences. As the process which engenders this expectancy, the first synthesis is that which makes of the canon a set of reading practices that determines in advance one's response to the text.

It is this expectancy that writers such as Rhys seek to challenge as they produce works which ostensibly repeat canonical texts. *Wide Sargasso Sea* as a whole, and in particular Part Three of the novel, is a repetition of Brontë's *Jane Eyre*. However, it is a repetition that exposes the processes of contraction and projection that Deleuze's first synthesis envisions by deconstructing colonial stereotypes and demonstrating, as Albert Memmi argued, that in colonialist discourse what 'is actually a sociological point becomes labelled as being biological or, preferably, metaphysical' (Memmi 1974: 71–2). Thus, in Part One of *Wide Sargasso Sea*, Mr Mason's complaint that the recently manumitted black Jamaicans 'won't work [. . .] don't want to work' (Rhys 2000: 30) is re-read by Rhys within the specific historical context of Jamaica in the wake of Emancipation and the end of the Apprenticeship scheme. As a result, Mr Mason's statement is revealed as a contraction of a number of converging sociological features of Jamaican society at that time into a general 'truth' about the newly manumitted population. A similar prejudice is articulated by Rochester during the couple's honeymoon at Granbois when he criticises Christophine's 'horrible' language as she asks him to 'taste my bull's blood, master' (71), her trailing dress and her languorous appearance. Here Rochester expresses the coloniser's point of view: the black woman, he infers, is unclean, sexualised and lazy. All colonial stereotypes, yet in each case, Antoinette responds by telling Rochester that each of these traits have a logical explanation: allowing one's dress to get dirty is an expression of affluence, slow movements are about precision. The difference between the two characters' perception of Christophine's actions is that Rochester reads in them a confirmation of colonial stereotypes as inherent or biological truths about black women, whereas Antoinette understands them as sociological points.

Rhys's novel consistently undermines stereotypes by illustrating their constructed, sociological basis. However, more than this, *Wide Sargasso Sea* draws attention to the additional issue of expectancy that is created: the specific repeating trait drawn from the past is generalised to form some 'truth' about the present and, as Deleuze points out, determines the way in which future repetitions are perceived. In Rochester's changing relationship with his wife, the full force of Rhys's critique of expectancy is felt. Throughout Part Two of the novel, Rochester

is clearly involved in a process of, to paraphrase Sartre, making Antoinette like what she would have to be like to deserve her fate (her eventual incarceration in the attic of Thornfield Hall as the mad, violent Bertha).[2] Rochester does this in the most matter of fact way: literally renaming her Bertha. More than this, however, he exploits prevalent stereotypes about white creoles in order to reread Antoinette's actions as a sign of her sexual proclivity and inherited madness. In this way, Antoinette's white dress, once admired by Rochester, comes to reflect his expectations of his wife's disposition. The dress that 'had slipped untidily over one shoulder and seemed too large for her' (105), as Carine Mardorossian argues, evokes association with '(black) female sexual wantonness and prostitution' (Mardorossian 1999: 1076), suggesting an intentional provocation on Antoinette's part and recalling Rochester's earlier claim that 'one afternoon the sight of a dress which she'd left lying on her bedroom floor made me breathless and savage with desire' (78). While this latter quotation evidences his sexual desire, Rochester's narrative increasingly seeks to read Antoinette's actions as a sign of her unrestrained sexuality. Thus, the dress that was, perhaps, carelessly left lying on the floor is misconstrued as a purposeful incitement to Rochester's desires. Antoinette's misunderstood intentions are underscored by the parallel image of the Miller's Daughter that occurs earlier in the text: one evening at Coulibri Antoinette recalls her 'favourite picture "The Miller's Daughter", a lovely English girl with brown curls and blue eyes and a dress *slipping off her shoulders*' (30, emphasis mine).[3] Antoinette's later mirroring of this image is, therefore, a misunderstood attempt to conform to Rochester's cultural values, to project an image of what, to her limited understanding, 'a lovely English girl' should look like.

It is, however, after his meeting with Daniel Cosway, the illegitimate son of Antoinette's father and a black slave, that Rochester's wilful misinterpretation of his wife's character becomes most apparent. Daniel's vindictive assertion that 'Mrs Cosway is worthless and spoilt, she can't lift a hand for herself and soon the madness that is in her, and in all these white Creoles, comes out' (80) re-enforces the prevalent stereotype that madness afflicts the white creole plantocracy. However, although Daniel's venom is clearly directed against the ex-slave-owners (he does not single out madness as Antoinette's or even Annette's affliction, but rather as the fate of 'all these white Creoles' (Mardorossian 1999: 1082)), Rochester recalls only that which confirms his misgivings about his wife. Echoing Daniel's parting words, 'give my love to your wife – my sister. [. . .] You are not the first to kiss her pretty

face' (104), the final pages of Rochester's narrative refigure Daniel's accusation as an admission of incest: 'give my sister your wife a kiss from me. Love her as I did – oh yes I did' (130). Rochester's firm resolution to secure his wife and her fortune by returning to his English estate is revealed as the product of his distorted recollection of Daniel's words and the confirmation of his own pre-determined expectations about creole, female sexuality: 'she thirsts for *anyone* – not for me [. . .] (a mad girl. She'll not care who she's loving). She'll moan and cry and give herself as no sane woman would – or could. *Or could*' (135–6). Faced with the discrepancy between Antoinette and the portrait of the 'lovely English girl' she tries to mimic, here Rochester resolves to make of his wife the very opposite image of female sexuality and, just as he names her Bertha, here he names her mad by giving her a sexual proclivity that 'no sane woman would' have. In his final resolution to 'see who hates best' (140), Rochester reveals the extent to which fears about miscegenation and the licentiousness of white creoles in nineteenth-century colonialist discourse created a projected expectancy about creole behaviour: a pre-established framework that determines Antoinette's actions from the outset of the novel.

Rhys consistently confronts colonial stereotypes not purely as a means to suggest that, in agreement with Memmi, that which is misconstrued as a biological or metaphysical fact is, in truth, socially or culturally determined, but also in order to expose the force of expectancy. It is, in particular, the issue of canonical expectancy, created by the texts of the past in the mind of the reader and projected into the future as a set of regulatory reading practices, that underlies the postcolonial tradition of writing back. In enacting a contrapuntal rewriting, authors expose the ideological biases that lie behind certain generalised expectations: highlighting the syntheses that occurred in order to produce particular stereotypes or reading practices, while at the same time revealing what was excluded by such generalisations. Rhys's text is exemplary in this respect: returning her text to the historical moment of Emancipation in the Anglophone Caribbean to expose the formation of colonial stereotypes and prejudices, and to highlight the social factors that were excluded from accounts of creole madness such as she found in Brontë's novel. By deconstructing colonial stereotypes, Rhys's novel challenges preconceived attitudes by returning the general to the specific. Writing back, therefore, works by confronting expectancy and what we might term a contrapuntal rereading/rewriting, in line with Deleuze's first synthesis of time, directs its attention to the contraction of the specific past into a generalised framework for determining the future.

In turn, this is exemplary of the distinction between counter-colonial discourse and the postcolonial previously delineated: by writing against the expectancy created by the first synthesis of time, Caribbean writers do not envision the continuation of a fixed relationship between centre and periphery, but engender an unpredictable future specific to but not limited by the contracted past. In other words, postcolonial texts must reject the determination of the Deleuzian first synthesis as a contraction of the past that has created the generalised colonial relationship and propose a new continuum. This latter process Deleuze calls the third synthesis of time: a differentiation of the past as a virtual presence in the production of an unpredictable future. It is only through an analysis of the ways in which Rhys contrapuntally exposes the virtual past she encounters in Brontë's novel and depicts the singular conditions by which Antoinette becomes Bertha that we can appreciate the full force of Rhys's re-dress and uncover the processes of virtual repetition and becoming-new that characterise a truly postcolonial aesthetics of writing back.

II. Becoming-Bertha

Far from remaining ambivalent to the role of past trauma in shaping the postcolonial present, writers such as Rhys, Harris and Glissant recognise history as formative, but see in trauma and oppression a potentiality to re-dress historical antagonisms and create something new. Indeed, it is this appreciation of a historical relation that effects the 'genuinely new' that Harris locates in Rhys's novel (Harris 1996: 6). Relating *Wide Sargasso Sea* to a template of war he finds in the history of the Caribs and Arawaks, Harris uncovers in the mythology of opposing cultures, common, repeating features that speak of a single source of collective creativity:

> it is a time of war. The rainbow compression of a tree is set on fire by the Caribs when the Arawaks seek refuge in its branches. [. . .] Creation suffers and needs to be re-dressed if the spirit of the stars is to be discovered again. The fire rages and ascends even higher to drive the Arawaks up and up until there is no further escape, they burn and rise into a spark in the sky of fiction. That spark becomes the seed of the garden of the Pleiades. (Harris 1983: 50)

For Harris, the memory of past conflict retains a virtual aspect, a 'seed', which remains latent in the collective unconscious, ready to be recalled and explored in order to creatively re-dress historical trauma. What Harris finds in Rhys's novel is the potential for a future that is not a

repetition of historical antagonisms and conflicts, but one which 'yields proportions of originality' (Harris 1996: 6) through a re-dress of the past. As Harris argues in his own novel *Jonestown*, 'it is essential to create a jigsaw in which "pasts" and "presents" and likely or unlikely "futures" are the pieces that multitudes in the self employ in order to bridge chasms in historical memory' (Harris 1996: 5). What Harris refers to as the 'incalculable' (5) line of continuity between the past and an unpredictable future emerges in the postcolonial project as a form of restructuring by which genuine novelty or 'newness' results.

It is in this respect that Deleuze emerges as an important figure in this debate and, in particular, his reformulation of a Spinozist plane of immanence or single-substance philosophy. Where Spinoza recast the Cartesian separation of Thought and Extension as an immanentist philosophy in which the single-substance universe (God or Nature) is conceived under two attributes termed *natura naturans* and *natura naturata*, a (virtual) self-creating aspect and the structure of (actual) created things respectively, Deleuze adopts Spinoza's dual sense of actual created world and virtual creative force as the two 'unequal odd halves' of reality (Deleuze 2004: 261).[4] Like Spinoza, Deleuze argues that reality must be considered both as the actual world and, at the same time, as a virtual plane which exists in opposition to the actual. Crucially, while the Cartesian split ensured that Thought and Extension persisted as non-relational, distinct spheres, Spinoza's single-substance ontology offers a relational structure that is reflected in the way in which Deleuze presents the actual and the virtual as caught up in a ceaseless movement from one to the other; where elements of the virtual become realised within the actual, experienced as sensations, events or identities. Where Deleuze exceeds Spinoza is in the profound creativity that he locates within this movement from virtual to actual. Rather, it is to another philosopher, Henri Bergson, that Deleuze turns to find a theory of the virtual as both a creative force (what Bergson terms *élan vital*) and a historical relation that, to recall Harris, 'yields proportions of originality, proportions of the "genuinely new"' (Harris 1996: 6).

It is the virtual's status as the absolutely-other, as that which cannot be represented since by definition it is that which exceeds the limits of the actual, that ensures its role in maintaining the renewed potential for newness. As Daniel Smith explains, because 'the virtual is constituted through and through by difference [. . .] when it is actualised, it therefore differs from itself, such that every process of actualisation is, by its very nature, the production of the new' (Smith 2007: 6). Thus, any actualisation of the virtual is essentially a creative process since what

emerges will be different from that which already exists within the actual. Crucially, it is this movement from virtual to actual (what Deleuze terms 'differentiation') that Bergson introduces in his notion of *élan vital*, understood as 'a virtuality in the process of being actualised' (Deleuze 1991: 94). With this concept, a full sense of the relation between actual and virtual comes into focus and, moreover, offers a philosophical paradigm for change and novelty. Since each actualisation of the virtual designates the emergence of the new, both *élan vital* and differentiation describe the creative evolution of the immanent totality: 'evolution takes place from the virtual to actuals. Evolution is actualisation, actualisation is creation' (Deleuze 1991: 98).

Differentiation accounts for the ways in which newness enters the world; however, more than this, Bergson's sense of the virtual as a 'gigantic memory' (Deleuze 1991: 100) ensures that this creative process is also a temporal evolution. The past for both Deleuze and Bergson is a virtual field that is available for differentiation within the present as recollection. At issue here is not history since the past as virtual has 'no psychological existence', it is 'not a particular past of a particular present but [...] is like an ontological element, a past that is eternal and for all time, the condition of the "passage" of every particular present. It is the past in general that makes possible all pasts' (Deleuze 1991: 56–7). By constituting that which enables each present to pass and 'preserve itself in itself' (58), the pure or general past (what Deleuze in *Difference and Repetition* terms the second synthesis of time) represents what James Williams describes as a virtual 'archive' in which 'all events, including those that have sunk without trace, are stored and remembered as their passing away, independent of human activity and the limitations of physical records' (Williams 2003: 93, 94).[5] Clearly, the premise of a pure past independent of physical records or active recollection is of great significance to Caribbean writers and theorists faced with a historical inheritance of 'amnesia' (Walcott 1998: 39–40). As Jean Bernabé, Patrick Chamoiseau and Raphaël Confiant write in their manifesto of *créolité*, 'our history (or our histories) is not totally accessible to historians. Their methodology restricts them to the sole-colonial chronicle. Our chronicle is behind the dates, behind the known' (Bernabé et al. 1993: 99). Precisely by accessing that which lies 'behind the known', a postcolonial synthesis of the past repeats the processes of actualisation that Deleuze locates in Bergson's theory of memory as virtual presence. Further, as a differentiation of the virtual what emerges from this process is new, a wholly novel postcolonial 'chronicle'.

Deleuze's account of the relational movement of the actual and virtual as a temporal, creative evolution in *Bergsonism* echoes his elaboration of the three syntheses of time in *Difference and Repetition*. While the past as virtual implies that any differentiation of the past will result in the production of the new, the first synthesis gives consistency to the present by relating it to a distinct series (AB, AB . . .) of the pure past and then subjecting it to the processes of contraction and generalisation. In this way, the newness that is created via differentiation is assimilated by habit and generalised as anticipated behaviour towards the future. The first synthesis alone cannot account for the radical sense of the future as an infinite potentiality that is evident in the writings of Harris and Glissant. As a result, this demand to account for a future with the ability to become-new leads us beyond the first and second syntheses of time 'in the direction of a third' (Deleuze 2004: 111).

With the third synthesis of time Deleuze offers a full account of how newness enters the world. Where the first synthesis demonstrates the way in which actual things gain consistency in the present and the second synthesis details a pure past into which each present falls, the third synthesis accounts for the prevailing sense that the future maintains the potential to become something wholly new. In other words, what I have presented here as differentiation, the actualisation of the virtual, Deleuze names the third synthesis of time: a theoretical paradigm that accounts for the infinite ways in which the actualised present retains the ability to become in unpredictable ways. Further, as a differentiation of the pure or virtual past, Deleuze's third synthesis may be used to elaborate Said's claim that contrapuntal reading uncovers that which was excluded from the colonial text. In other words, when Said argues that we should re-examine *Jane Eyre* to discover the latent prejudices within the text, he is asking us to differentiate Brontë's work, exposing the unspoken assumptions and unacknowledged exploitations that are taken for granted within the economy of the nineteenth-century novel. In turn, what this contrapuntal reading engenders, according to the Deleuzian model, is new. By actualising the virtual (here the virtual 'side' of the canonical text), the repetition on which the third synthesis is based is not, as in the first, grounded on recurring instances of the contracted past, but on the repetition of the virtual past's becoming-actual, of differentiation as the production of the new (what Deleuze designates the eternal return of difference-in-itself). In turn, writing back produces an original work of literature not because it repeats the actual text or canon that has generated certain generalised expectations and reading practices, but because in actualising the virtual aspect of the

canon it repeats only the processes of differentiation necessarily as a becoming-new.

The same holds true of Rhys's contrapuntal reading of stereotypes in *Wide Sargasso Sea*, in which her account of the ways in which these stereotypes become established reveals the specific socio-economic factors that were excluded from the generalised form. What Rhys's novel repeats then is not the actual colonial stereotype *per se*, but the processes of becoming that engendered those contractions. In the same way, by contrapuntally rewriting *Jane Eyre*, Rhys's novel does not repeat the actual elements of Brontë's work, but, more specifically, the processes of becoming that constitute it: Antoinette's becoming-mad; Rochester's becoming-cold-hearted. Moreover, as with all becomings, according to the Deleuzian model, the movement from virtual to actual that the third synthesis encapsulates does not exhaust the virtual: the virtual is not actualised outright. Rather, a virtual aspect is differentiated with each becoming *and* each actual state that one becomes maintains, in excess of its actuality, its virtual aspect: 'every object is double without it being the case that the two halves resemble one another, one being a virtual image the other an actual image' (Deleuze 2004: 261). It is this renewed virtuality that accounts for the prevailing sense that things always have the potential to become-new: as Claire Colebrook argues, 'each actual thing maintains its own virtual power. What something is (actually) is also its power to become (virtually)' and that this virtual difference is 'the power to become in unforeseen ways, always more than this actual world, and not limited by its already present forms' (Colebrook 2002: 96). As a result, with each repetition (of stereotype, of text) in Rhys's novel, not only do we see how things became what they actually are, but remain aware of how very different they might have been and, indeed, might yet become. It is this potentiality to become in unforeseen ways that the third synthesis as differentiation evokes. Accordingly, with each actualisation of Bertha (Antoinette's becoming-mad, becoming-violent), Rhys highlights how things might have been or might yet become very different. Rochester's moment of hesitation, 'I shall never understand why, suddenly, bewilderingly, I was certain that everything I had imagined to be truth was false. False. Only the magic and the dream are true – all the rest's a lie. Let it go' (138), Christophine's offer to care for Antoinette, and Rhys's famously open ending, these alternative paths all suggest lines of becoming that remain virtual, engendering the possibility that in every repetition of becoming-Bertha, becoming-Rochester things could have been different. It is this virtual aspect of becoming that destabilises the expectancy of the first synthesis of time and ensures that

the historical re-dress enacted in postcolonial writing back repeats only the revisionary potential of differentiation as the production of the new.

This is why, to use Colebrook's phrase, becoming is 'the hidden force of difference' (Colebrook 2002: 120): it designates the actualisation of different virtual intensities as a becoming-new and conceives of difference 'independently of the forms of representation which reduce it to the Same, and the relation of different to different independently of those forms which make them pass through the negative' (Deleuze 2004: xvii–xviii). Deleuze rejects the Hegelian formula of difference whereby any object (salt, say) is differentiated negatively via its oppositional relation to its other (pepper). Rather, for Deleuze difference is an expression of becoming, so that, to extend the example, salt is different to other sensations as an actualised intensity of becoming-salty, becoming-crystallised. As Williams explains, 'according to Deleuze you are not different from other humans because you differ in this or that actual characteristic but because your thoughts and sensations, the way you change, express a different relation of intensities' (Williams 2003: 9). Thus, if we look to *Wide Sargasso Sea* and find that Antoinette is different to Brontë's Bertha, it is not in actual characteristics that the significant difference lies, but in Antoinette's actualisation of different degrees of becoming-mad, becoming-licentious. What we recognise in Rhys's novel is a different process of becoming at work: Antoinette does not become mad because of some inherited disposition to do so, but because of a range of emotional, social and gender-specific forces acting upon her. This is the very definition of what Deleuze calls a minor literature: repeating not the actual elements of the canon, but the virtual becomings as that which makes things differ. Texts like *Wide Sargasso Sea*, Colebrook argues, repeat 'the hidden forces of difference that produce texts, rather than repeating the known texts themselves' (Colebrook 2002: 120); or again, 'a work of literature is not to *copy* that work, but to repeat the forces of difference that produced that work [. . .]: a repetition of the virtual and hidden power of difference' (121).[6]

Wide Sargasso Sea in a very clear way draws from the virtual side of *Jane Eyre*. As Rhys herself claimed, responding to Brontë's depiction of 'the poor Creole lunatic', 'that's only one side – the English side' (cited in Raiskin 1996: 133). Bringing to light the other side of the story, detailing Bertha's West Indian upbringing, tracing the disillusionment of Rochester, taking her reader behind the closed doors of Thornfield Hall, Rhys contrapuntally differentiates *Jane Eyre*. In doing so, what is produced is not a continuation of the same (this would be a result of the first synthesis), but an original work

through the repetition of the processes of differentiation: 'repetition is never a historical fact, but rather the historical condition under which something new is effectively produced' (Deleuze 2004: 113). Further, by accounting for an engagement with the past that creates a new vision of the future, Deleuze's third synthesis can be used to expose the full significance of Harris's reading of *Wide Sargasso Sea*. The fire motif that runs throughout the novel, signifying both destruction (the burning of Coulibri) and resistance (Antoinette's fire-red dress which symbolises her revolt against her husband and foreshadows her expected burning of his estate house), speaks to Harris of Rhys's attempt to re-dress absolutes and 'the paradox of resources of variables of the imagination through which the past speaks to the present and to the future [. . .], its inner capacity for re-dressed bodies and imageries' (Harris 1983: 61). What Harris envisions is a return to the memory or mythology of past conflicts in order to uncover unconscious (virtual) dimensions which may be synthesised in such a way as to allow the past to 'speak' to the present and future in a new way. Indeed, Deleuze envisions this too: the third synthesis, he tells us, marks a break or 'caesura' in the contemporary ordering of time and witnesses the birth of a new order of 'the before and the after' (Deleuze 2004: 112). The third synthesis is not a rejection of the past and although it incites a future that is radically different from what has come before, it is a future that is both linked to the past and which, to evoke Bhabha, generates a new continuum that leads from past to present and future.

Where Harris and Deleuze ostensibly disagree is in Harris's claim that Rhys's re-dress of historical antagonisms in *Wide Sargasso Sea* works through the identification of what he calls a 'core of likeness' (Harris 1983: 56). This point emerges in his discussion of the Arawaks and Caribs whose adverse relationship, he argues, might be addressed by the realisation of a common creative thread. In the same vein, Harris finds in Rhys's 're-dress of Charlotte Brontë's polarisations', a similar trajectory in which 'a cross-cultural web and likeness are revealed [. . .] through points that unravel apparently incompatible appearances' (56). It is in the exposure of 'likeness[es]' in apparent polarisations that Harris locates the potential for historical re-dress, a move that ostensibly sets him in opposition to Deleuze's celebration of difference and becoming. However, Harris's evocation of likeness is not to be misunderstood as signifying the same: the same is the foundation of the 'narrow basis of realism [. . . which] tends inevitably to polarise cultures or to reinforce eclipses of otherness within legacies of conquest that rule the world' (55). Realism is a reflection of the same and, accordingly, creates

the polarisations Harris seeks to overcome. Likeness, therefore, is not equivalent to the same: as Harris argues,

> the politics of culture assume that like to like signifies a monolithic cradle or monolithic origin. Whereas in creative subtlety or re-dress [. . .] monoliths are extremes/extremities that become fissures of emotion in claustrophobic and historical or cultural space, when imbued with asymmetric spirit or intangible, untameable life. Those fissures are parallels, extensions [. . .] in and into bodies of experience whose mental point or core of likeness turns into the spark or passion of science and art. (Harris 1983: 56)

What Harris refers to as a 'core of likeness' is not the identification of the same, but what he senses in the cross-cultural web: a single, collective unconscious that links all peoples and ties all cultures to a common creative 'spark'. Put another way, what Harris finds revolutionary is the virtual presence of the past as an undifferentiated (virtual) whole, to frame this in Deleuze's terms, as that which gives all the ability to become in unforeseen ways.

Harris's presentation of the past or collective unconscious as a virtual archive into which each present passes is fundamentally aligned with the Deleuzian/Bergsonian sense of creative evolution and memory. Paradoxically, although Harris identifies a 'core of likeness' at the heart of historical re-dress, it is fundamentally an issue of what Deleuze terms difference: a repetition of the virtual past's becoming-actual as that which engenders a new ordering of history. In particular, Harris invokes a Deleuzian concept of difference-in-itself rather than the Hegelian dialectic by arguing for the recognition of 'ceaseless parallel animations or subtle likeness *through* contrasting densities or opposite and varied appearances' (56). In other words, what is taken for granted as a difference achieved through opposition is, in fact, a difference of degrees of becoming, of 'densities' or 'appearances'. That Harris employs the term 'likeness' rather than Deleuze's difference-in-itself is a sign of the emphasis that Harris wants to place on the immanent creativity of the virtual as that from which differences are actualised or become-actual. To the extent that all identities are particular configurations or expressions of differentiated becomings emerging from the infinite virtual aspect of a single, immanent reality, all apparent adversaries are 'like' one another in that they all actualise the virtual albeit in different ways. Thus, Harris notes, despite their polarisation in *Jane Eyre*, 'Bertha and Rochester possess in themselves, within the genius of Charlotte Brontë, the seeds of such re-dress' (61). Brontë's characters always had the potential to overcome historical antagonisms, the ability to become

in unforeseen ways. If the 'seminal force of the fiction of the whole' (61), Brontë's commitment to the structuring influence of tradition and ideology, meant that this potential remained virtual in *Jane Eyre*, in Rhys's novel the repetition of becoming rather than the actual aspects of Brontë's text realises the potential for re-dress in the production of a new work of (minor) literature.

Through the repetition of *Jane Eyre* in *Wide Sargasso Sea* the reader encounters not an accumulation of actual differences, but difference-in-itself: the expression of becomings that emerge in particular ways relative to a range of other becomings. The actual differences between *Jane Eyre* and *Wide Sargasso Sea* – the discrepancy of names ('Bertha is not my name' [121]); of dates (the timeframe of *Jane Eyre* is 1789–1808, while *Wide Sargasso Sea* is set slightly later, roughly 1834–44); of mother's name (Bertha's mother's name is Antoinetta, not, as in *Wide Sargasso Sea*, Annette); of family lineage (there is no Cosway line in *Jane Eyre*) – these actual discrepancies alone diminish full the significance of Rhys's novel by setting up an oppositional framework in which *Wide Sargasso Sea* is measured against the gold standard of the original parent text, *Jane Eyre*.[7] On the other hand, by acknowledging the virtual repetitions in *Wide Sargasso Sea* a more significant difference is uncovered, one which does not function through negation but as an experience of becoming expressed in relation to other becomings or intensities such as Emancipation, creole society and colonial attitudes. Features of Rhys's novel such as the changes in Antoinette's name from Antoinette Cosway to Mason and finally Rochester, her husband's renaming of her as Bertha, Christophine's affectionate but childlike names for her, and Daniel's reference to her as Antoinetta (the middle name of Brontë's Bertha and her mother's name in *Jane Eyre*) should not be misunderstood as a form of violence against the original identity that is Antoinette. Such a move would be based on actual difference. Rather, these developments express Rhys's repeated presentation of becoming, expressed not from the point of view of a pre-determined, original identity against which these becomings are judged as good or bad, but as constitutive of Antoinette's identity itself.

Such an approach is necessary for any Deleuzian reading of *Wide Sargasso Sea* given his claim that repetition 'is not underneath the masks, but is formed from one mask to another' (Deleuze 2004: 19). Here Deleuze characterises identity as an always-changing series of becomings, a process, Williams explains, akin to death: 'as we become, we die as this particular self and we move towards a final death. But there is something revivifying in the expression of becomings, they make a

life that must end in death one that participates in intensities' (Williams 2003: 9). In a very clear way, by presenting us with a series of becomings that will end in Antoinette's becoming-Bertha and her suicide, Rhys shows us the inevitable decline towards death as Antoinette Cosway becomes Mason becomes Rochester. The reader witnesses the death of a number of Antoinette's 'selves', but in line with Williams's reading of *Difference and Repetition*, remains aware of the 'revivifying' potential inherent in that process. Antoinette's declaration of her new Mason patronymic, embroidered in vivid red – 'I will write my name in fire red, Antoinette Mason, née Cosway, Mount Calvary Convent, Spanish Town, Jamaica, 1839' (44) – records the passing of her previous self (Antoinette Cosway) and stands as a positive assertion of a new identity, a point Simpson touches upon when she argues that in writing her name Antoinette 'creates a bold, fire-red marker of her life that very much contrasts with the attempts at erasure on the part of those who surround her' (Simpson 2005: 126). Although not consciously pursuing a Deleuzian reading of Rhys's novel, here Simpson identifies the central drive of the novel as the tension between a process of becoming that renews the life of the protagonist and one which leads to her pre-determined fate.

Antoinette's other masks or becomings similarly expose such a tension. The parallel established between Antoinette and her childhood friend Tia, who appears as a mirror image of the protagonist on the night of the burning of Coulibri – 'we stared at each other, blood on my face, tears on hers. It was as if I saw myself. Like in a looking-glass' (38) – is recalled (repeated) at the end of the novel to offer a sense of how things might have been very different for Antoinette. Tia, as Antoinette's double, is, in Part Three of the novel when she appears in Antoinette's dream, a virtual side or, more precisely, a potential differentiation of Antoinette's character: a sign of one self she might have become if it were not for the factors of economic tension, racial difference and social discontent (all intensities expressed in relation to the experience of Emancipation in Jamaica), which led Antoinette's becomings in a specific direction, towards becoming-Bertha. The same is true of another double, the picture of 'The Miller's Daughter', which Antoinette attempts to mirror. In doing so she hopes to become more like the image of English virtue she believes her husband desires in a wife. Yet again, this projected new self does not allow Antoinette to become like 'a lovely English girl' (30), because of her relation to another set of intensities and becomings. Antoinette, like her mother, is 'so without a doubt not English' (30), and her creole heritage evokes for Rochester a different set of becomings that express degeneracy, madness and an illicit sexuality. As a result, her

attempt to become-English is overwhelmed by the forces that repeat the processes of Brontë's novel as becoming-Bertha.

One of the most commented upon aspects of *Wide Sargasso Sea*, besides that of its association with *Jane Eyre*, is the novel's exploration of the mother/daughter relationship. Critics such as Ronnie Scharfman employ the developmental psychology of Nancy Chodorow and D. W. Winnicot in order to read Rhys's novel as 'the narrative of a subject's painful inability to constitute itself as an autonomous identity, to belong' (Scharfman 1981: 99–100).[8] Following Winnicott's claim that what a baby sees in his/her mother's face is him or herself, Scharfman argues that Antoinette projects a fragmented identity because as a child she did not experience her mother as a mirror. However, rather than reading Antoinette's narrative, as Scharfman does, as the account of an original identity that then becomes fragmented throughout the course of the novel, a Deleuzian approach suggests that Rhys presents a series of inevitable becomings that co-exist alongside a range of virtual ways in which Antoinette could possibly become. These alternative possibilities are presented to the reader in the mirror images and doubles that exist within the novel not only as virtual lines of becoming that Antoinette might have followed, but in themselves as actual differentiations that cannot be mirrored or repeated: as difference. Deleuze, Williams argues, paints a similar picture:

> reflections, doubles, soul sisters and brothers, acts of celebration and commemoration are all cases where the repetition or the experience of repetition is accompanied by intense reactions allied to the persistence of difference. [. . .] In each case, the emotions are double – something is sensed in the same way but there is also a sensation of a profound difference. (Williams 2003: 32–3)

Just as Rhys's novel contrapuntally differentiates *Jane Eyre*, Antoinette's doubles offer virtual lines of becoming that coexist with the various ways in which Antoinette 'actually' becomes. Moreover, just as *Wide Sargasso Sea* as the repeated double of *Jane Eyre* illustrates 'the persistence of difference', the fact that in every repetition the only likeness is difference or the power to become, so Antoinette's doubles evoke the dual sense of similarity and difference. For Antoinette, Tia is her mirror image – 'it was as if I saw myself. Like in a looking-glass' (38) – but also a sign of their irreducible difference. 'The Miller's Daughter' is the image of Antoinette's future self and the marker of her unsettling creole difference that Rochester will never manage to accommodate. For Rhys, as for

Deleuze, the repetition evident in reflections, mirror images and doubles echo only the forward movement of becoming and the impossibility of any other form of repetition. The self cannot become its double or mirror image, it can only become: 'I remember watching myself brush my hair and how my eyes looked back at me. The girl I saw was my self yet not quite myself. Long ago when I was a child and very lonely I tired to kiss her. But the glass was between us – hard, cold, and misted over with my breath' (147). It is this persistent separation, the repetition of difference rather than the same that *Wide Sargasso Sea* evokes in its presentation of Antoinette's reflected image.

Antoinette's mirror image evokes the double emotion that Williams recognises in *Difference and Repetition*: almost herself, but not quite. Instead of unity, separation persists, and a similar process emerges in Antoinette's relationship with her mother. In line with Winnicott, Antoinette does, initially, approach her mother's face as a potential mirror. But rather than never seeing herself reflected in her mother, as Scharfman argues, Antoinette encounters in her mother a series of becomings (becoming-disillusioned, becoming-unstable) that she is expected to mirror. The most striking example of this is offered in the repeated image of Annette's frown, 'deep – it might have been cut with a knife' (17), in Antoinette. As Rochester later observes of his wife, 'I looked at the sad droop of her lips, the frown between her thick eyebrows, deep as if it had been cut with a knife' (114). This apparent realisation of the mother mirror image is enforced once again by the novel's ending, in which Antoinette's appearance as the madwoman surrounded by the flames of the burning estate house is a repetition of her mother's fate: 'I went into the hall again with the tall candle in my hand. It was then that I saw her – the ghost. The woman standing with streaming hair. She was surrounded by a gilt frame but I knew her' (154). Here Antoinette becomes both her mothers, Annette and Bertha, signifying for critics such as Scharfman a 'long-desired, long-delayed mirroring fusion' with the mother that gives Antoinette a 'paradoxical freedom through death' (Scharfman 1981: 104).[9] What such a reading ignores, however, is the way in which the ending represents a culmination of forces that have coerced Antoinette to mirror those aspects of her mother that she does not identify with, her pain and her madness: 'I hated this frown and once I touched her forehead trying to smooth it'; 'after I knew that she talked aloud to herself I was a little afraid of her' (17). Looking beyond the actual repetition of images which recall the mother figure – the barefooted woman, the burning house, the secluded madwoman – Rhys's novel depicts a process of becoming that

is stunted by being coerced (by expectation and habit) into a repetition of the same rather than difference.

Mirror images and doubles are discrepant throughout *Wide Sargasso Sea* because, as a repetition itself, Rhys's novel draws attention to the fact that there is no possible 'mirroring fusion' only, to use the Deleuzian formula, the eternal return of difference. Characters such as Rochester who fail to recognise the difference in repetition, who see in repetition only the recurrence of the same or the general and find in Antoinette only the recurring image of the madwoman in the attic that is her mother/Bertha, fail to realise the potential for re-dress in the virtual aspect of Brontë's novel. In this respect, he becomes the Rochester of *Jane Eyre* who claims 'Bertha Mason is mad and she came of a mad family. [...] Bertha, like a dutiful child, copied her parents' (Brontë 1990: 298). It is the fate of Antoinette's other mother, Bertha, that warns the reader against celebrating too readily any union with the mother, for she is precisely the image of creole madness that Rhys sought to deconstruct. Rhys is not the 'dutiful child' copying the mother text; rather *Wide Sargasso Sea* is a difficult double, a 'repetition-with-difference' (Harrison 1988: 135) as Nancy Harrison observes. It is an account of Antoinette's becoming-Bertha that continually repeats her difference (her becoming).

Rather than reading in Antoinette's alienation from her mother a sign of her fragmented psyche, the model of becoming that I have used to discuss Rhys's novel offers an understanding of identity as a series of masks. In turn, as Williams explains with respect to Deleuze, this demands a new approach to psychoanalysis based not on the validation of actual events or the recovery of an original trauma, but rather 'analysis "works" because roles and masks are authenticated. [...] It is a site where a way of creating other masks is given a seal of approval' (Williams 2003: 49). If we may be empowered by the authentication of our masks, then the converse also holds true: masks which are rejected creates alienation. This, I would argue, is precisely the trauma that Antoinette suffers. Her attempt to validate her identity as Antoinette Mason by embroidering it in fire red, her attempt to take on the role of the Miller's Daughter, her childhood mirror image in Tia, these all stand as masks (becomings) that are never authenticated. Her marriage to Rochester, his fixation on her sexuality and heritage, and the racial tensions of post-Emancipation Jamaica, these factors deny Antoinette's masks the approval she seeks. Instead, those masks which offer Antoinette the least degree of freedom are the ones that are approved: her becoming-Annette, becoming-Bertha. Thus, what the

reader witnesses is a series of becomings or masks, some of which are validated, some of which are not, and it is in the rejection of certain masks, forcing Antoinette to *become* like what she would have to be like to deserve her fate, that the greatest violence lies.

It is the denial of the significance of the virtual past, the ability to become in unforeseen ways, that Rhys most directly seeks to challenge in *Wide Sargasso Sea*. As a repetition itself, Rhys's novel differentiates *Jane Eyre* by actualising the series of becomings that lead up to the burning of Thornfield Hall. What results is new, drawn from the virtual aspect of the canon, repeating its difference. Rhys's open ending which only suggests that Antoinette finally enacts Bertha's role again exposes the expectancy of the reader and the desire to find in repetition the perfect mirror image: 'at last I know why I was brought here and what I have to do. There must have been a draught for the flame flickered and I thought it was out. But I shielded it with my hand and it burned up again to light me along the dark passage' (155–6). Although this moment is a repetition of Brontë's novel, it is not an actual repetition: it takes us behind the closed doors and 'dark passage[s]' of Thornfield Hall that cannot be accessed by Jane Eyre. As a result, Rhys's ending remains alive with the potential to become a very different story – the flame might go out, Antoinette might not follow the fate of Bertha foretold in her dream and in the life of her mother. Such a virtual possibility critics like Graham Huggan have identified in the novel's resolution: 'should we take Rhys's Antoinette for Brontë's Bertha, and interpret the ending of *Wide Sargasso Sea* accordingly as the prelude to an inevitable act of self-sacrifice? Or should we listen again to the resurrected Creole parrot? "Ché Coco, Ché Coco". Answering back, cheekily, to Her Mistress's Voice' (Huggan 1994: 657). It is in the discrepancy of repetition that Rhys's novel opens up to the virtual potential of Antoinette's narrative, foregrounding a series of becomings that, in illustrating how the protagonist becomes-Bertha, draws attention to the myriad ways in which things could have been very different.

The Deleuzian framework that this article has traced provides the opportunity to reread Rhys's postcolonial 'writing back' as an illustration of difference as well as repetition: challenging the reader's expectancy and presenting its own becoming-new through a differentiation of the virtual text of Brontë's novel. In the final analysis, Antoinette's claim that 'there are always two deaths, the real one and the one people know about' (106) not only prepares the reader for another death besides her suicide at Thornfield Hall (the death people know about), but displays a sensitivity towards understanding being as a series of becomings

and deaths. Like her mother whose 'death' she witnesses at the burning of Coulibri, Antoinette dies as one particular self as she becomes another: 'like when he wouldn't call me Antoinette, and I saw Antoinette drifting out of the window with her scents, her pretty clothes and her looking-glass' (147). Rhys's presentation of Antoinette's two deaths, 'two at least' (106), then, finds resonance with Deleuze's claim that 'every death is double', and that 'suicide is an attempt to make the two incommensurable faces coincide or correspond. However, the two sides do not meet, and every death remains double' (Deleuze 2004: 322–3). Bertha's suicide leaping from the rooftop of a blazing Thornfield Hall is discontinuous with Antoinette's inevitable, actual death. The impossibility of bringing together the two sides of death – the death of Antoinette as she becomes-Bertha and her actual suicide – is underscored by Rhys's omission of the anticipated death scene. Her suicide remains outside the bounds of *Wide Sargasso Sea*, for although Antoinette's becoming-Bertha brings her one step closer to her inevitable end, it is a death that Rhys leaves resolutely double, existing virtually in her own novel, only to be realised 'later' in *Jane Eyre* as the continuation of Bertha's story.

Notes

1. Despite Hallward's employment of Deleuze to demonstrate the self-defeating aims of postcolonialism, his distinction between a counter-colonial stance that is locked into a fixed dialogue between coloniser and coloniser and an alternative view that holds that 'any creative expression is irreducibly specific to (though not specified by) the situation of its articulation' (Hallward 2001: 62), is one which I adapt to delineate the postcolonial project. For further analysis of Hallward's problematic reading of postcolonialism, see Burns (2009).
2. As Sartre writes, 'the oppressors produce and maintain by force the evils that render the oppressed, in their eyes, more and more like what they would have to be like to deserve their fate' (Sartre 1974: xxvi).
3. Mardorossian also notes the parallel between Antoinette's dress slipping off one shoulder and the depiction of the Miller's Daughter (Mardorossian 1999: 1076).
4. Stuart Hampshire's *Spinoza and Spinozism* provides a lucid outline of Spinoza's single-substance philosophy. For further discussion of Spinoza's philosophy in a postcolonial context, see Burns (2009).
5. Jay Lampert similarly implies this sense of archiving in his description of the second synthesis as 'a "storehouse" of temporal moments' (Lampert 2006: 41). If the 'flaw in [this] metaphor is that it suggests inert memory packages' (41), then Williams's evocation of the Foucauldian/Derridean archive better underscores the creative force of the second synthesis. See, for example, Derrida's claim that 'the archive [. . .] is not only the place for stocking and for conserving an archivable content of the past which would exist in any case, as such, without the archive. [. . .] No, the technical structure of the archiving archive also determines the structure of the archivable content even in

its very coming into existence and in its relationship to the future. The activation produces as much as it records the event' (Derrida 1995: 17). Foucault's archive is similarly creative, particularly as that which drives the production of the new as differentiation: 'its threshold of existence is established by the break that separates us from what we can no longer say, and from what falls outside our discursive practice. [. . .] It causes the other and the outside to burst forth' (Foucault 1972: 130–1).

6. Colebrook's brief analysis of *Wide Sargasso Sea* remains one of the few Deleuzian readings of Rhys's work. In another Deleuzian reading, Carol Dell'Amico draws on Deleuze's account of masochism in *Coldness and Cruelty* in order to reread Rhys's early texts as expressions of a subversive female empowerment (Dell'Amico 2005: 57–95). The main body of recent criticism on *Wide Sargasso Sea*, however, has focused on Antoinette's ambivalent creoleness as the primary site of resistance to colonial/patriarchical orders (see Alcocer 2005: 160–6; Huggan 1994; Mardorossian 1999; Murdoch 2003; Simpson 2005: 111–15, 136).
7. Kloepfer's study presents an analysis of the specific repetitions of *Jane Eyre* in Rhys's novel, such as parallels between Jane and Antoinette's dreams (Kloepfer 1989: 154).
8. For further discussion of the mother/daughter relationship in Rhys's work, see Gunner (1994: 136–51), Simpson (2005: 8–16, 115–21), O'Connor (1986: 171–96), Kloepfer (1989: 142–58).
9. Following Scharfman, Klopfer and Gunner have similarly viewed the mother connection as empowering, allowing Antoinette to narrate her story (Kloepfer 1989: 147–8); or to challenge patriarchy (Gunner 1994: 143).

McDeleuze: What's More Rhizomal than the Big Mac?

Kane X. Faucher The University of Western Ontario, London

Abstract

The popularity of Deleuze and Guattari is an undeniable precedent in current theoretical exchanges, and it could be stated without much contention that one's theoretical positioning must at some point deal with the salient conceptual offerings of Deleuze and Guattari, especially their double-opus, Anti-Oedipus and A Thousand Plateaus wherein a wealth of critique abounds. However, the significant trends concerning Deleuze and Guattari 'scholarship' may be jeopardised by the (ab)use of certain conceptual themes and methods in their work that are distorted and employed by big business looking to secure their legacies of power by means of a control mechanism that looks to subjugate an entire world by means of (to borrow a term from Mihai Spariosu) 'globalitarianism'. Our aim here will be to use McDonald's Corporation as an example of how the theoretical offerings of Deleuze and Guattari have been indirectly and hastily deployed for corporate ends, how these attempts are counter-Deleuzian, and to answer at least one of Žižek's criticisms against Deleuze.

Keywords: Deleuze, immaterial labour, corporate structure, rhizome, Žižek, nomadology

One of the most pressing problems facing Deleuze and Guattari scholarship is a criticism that Žižek evokes in *Organs without Bodies: Deleuze and Consequences* (2004); namely, that those who have some brief familiarity with the texts will misemploy the conceptual strategies found there for the purposes of advancing corporate interests. What if some post-Machiavellian corporateer reads the Deleuze and Guattari trinity of *Anti-Oedipus*, *A Thousand Plateaus* and *What is Philosophy?* What if the lessons gleaned there are distended or abused for nefarious corporate ends? One can only imagine the applications where such a

being reads the chapters on how to create concepts as how to create global corporate empires, or how to build a global corporate empire without micromanagement and accountability as a merely metaphoric transposition from the body without organs (BwO). And what of creating the business of pure affect? No longer relying on traditional monopoly capital, but global zones of intensity with rhizomal webworks that operate under a new 'virtual' digicratic order. These constructions are ghastly and do not demonstrate a careful reading of Deleuze and Guattari's oeuvre; however, even misapplications can run the perilous risk of actually succeeding as models and practices, to the detriment of those working to limit the viral capacity of global capitalism.

The new slogan of late capital is to appear to concede locally, dominate globally. One of the new developments that distinguishes contemporary capitalism from the Fordist economy is precisely the decentralisation and rhizomal expansion of the corporation that makes the evasion of national bodies of law a much simpler affair. Calling to account the major meta-corporations for environmental degradation, labour abuses abroad and the flow of wealth to alternate regions of the world that function as tax shelters has quickly become the central problem that governments today are now powerless to face, for to pinion the expansionist policies of certain corporations only leads to the more disastrous economic repercussions of *glissement*; that is, the corporations are fully in their power to dismantle their operations in one region and set upon a more favourable terrain. Wal-Mart, for instance, can effectively de- and reterritorialise a given terrain by selecting areas of employment vacuum, offering the desperate multitude jobs, and effectively reinscribe and reterritorialise that region as yet another town that bears the indelible stamp of Wal-Mart, even to the detriment of local fledgling industries or environmental concerns.[1] Like fungus after a storm, these meta-corporations can pop up anywhere and add to the resonance factor of its rhizomal power nexus as it is surreptitiously wielded inter-regionally. As Laclau points out, the disparate elements come to resonate and thereby constitute the emergence of a fascist nexus. However, the strength of this nexus is its ability to shift its centre so that the archaic 'centre' is constantly shifting and adapting to new phenomena. This still classifies, *qua* Deleuze and Guattari's definition, as a fascicular root-tree of sorts rather than a true rhizome, but trees look like rhizomes when one is encompassed by the mad proliferation of its varying foliage. What makes the true determination or cut between the two models is precisely the awareness and critique of the ubiquity of strategies

employed by these meta-corporations that merely champion diversity within prescribed limits rather than true affirmative differences – to cater to local tastes while maintaining an Aristotelian taxonomic-style structure at its global base. For example, McDonald's has perfected this to an art: by catering to local-specific tastes as a kind of soft cultural concession (in Maine, the McLobster), McDonald's effectively reinscribes the social margin into its totalising menu, and makes it bear the stamp of the corporation so that there could come a point when, in Maine, the lobster industry will be completely non-distinct from the corporation that has absorbed it into its product array.

I. McDeleuze

When careful fidelity to the text is not heeded, it is no secret that constitutive and wilful misreadings may result. Let us consider Deleuze and Guattari's notion of the concept and how it seems already installed (per bad reading) in the concept that is McDonald's. What can be more crudely and physically rhizomal than the Big Mac? The size of the 'beef' patty itself will shrink or expand in anticipation of, or response to, cultural demand. McDonald's is an intriguing paradigm case for discussing corporate global expansion. The 'intensive affects' that impersonally de- and reterritorialise the traditional meat and potatoes fare as 'burger and fries' are merely a metonymic transition, and the 'flow of becoming' is also rendered crudely in the McDonald's system by designing seating that will be uncomfortable after twenty minutes (as well as the strategic use of 'panic colours') so that there is a constant flow of new customers supplanting the old.

Was Ray Kroc, the founder of the modern McDonald's and an industrious opportunist who bought out the previous roadside burger stand from its originators, an ante-Deleuzian? Does he not qualify as a 'concept creator' in that rigorous Deleuzian sense? If a concept 'is only created as a function of problems which are thought to be badly understood or badly posed' (Deleuze and Guattari [1990] (1994): 16), did not Kroc find in the old concept of McDonald's a problem of non-expansionism, non-proliferation and limited access, thereby applying his own conceptual innovations to resolve or repose the problem differently? Kroc began as a salesman for Dixie cups and appended the task of selling milkshake machines that could multiply production, and so incorporated these as 'concepts' to the newly posed problem of a fledgling burger stand. As Deleuze and Guattari write, 'In any concept there are usually bits or components that come from other concepts, which corresponded

to other problems and presupposed other planes . . . each concept carries out a new cutting-out, takes on new contours, and must be reactivated or recut' (Deleuze and Guattari [1990] (1994): 18). Each of the concepts had to share their zones. For Kroc, the problems posed were the efficacy of cups, milkshake machinery and fast food restaurants. By uniting these concepts, or at least their components, he was able to recast the new creation as the concept of McDonald's that has mostly been handed down today in its current form. Inspired as well by the use of cartoon characters, Kroc was able to respond to the problem of how to entice families to frequent these restaurants by targeting his marketing to children. These 'conceptemes' were made to resonate in such a way as to ensure a heterogeneous endoconsistency that made each concept component indiscernible in their neighbourhood or zone. The exoconsistency of the McDonald's concept was its subsequent alliances with various other concepts: movie promotions, toys and the like. The McDonald's concept speaks its Event, the haecceity of its expression. The actual restaurant is not determined by its coordinates on a map; it only suffices that it appears somewhere, anywhere, as an intensive ordinate. The means by which it absorbs other concept components assures its resonant becomings, such that 'each concept will therefore be considered as the point of coincidence, condensation, or accumulation of its own components' (Deleuze and Guattari [1990] (1994): 20). The further danger in misreading may be noted here when the concept is considered in properties both absolute and relative:

> It is relative to its own components, to other concepts, to the plane on which it is defined, and to the problems it is supposed to resolve; but it is absolute through the condensation it carries out, the site it occupies on the plane, and the conditions it assigns to the problem. As whole it is absolute, but insofar as it is fragmentary it is relative. (Deleuze and Guattari [1990] (1994): 21)

Even the variations within the concept are inseparable. However, we can see how this can easily be misread: McDonald's, as a concept packed with inseparable components upon a larger plane of expansionist capital, will be absolute in the appropriations (condensations) it can make wherever it is located, but will be fragmentary insofar as there is no one expression of the concept of McDonald's that could truly be said to function as the true and distinct 'archetype' since its success depends on local variations catering to local tastes. Although corporate decentralisation theories have aimed to resolve the dangers of vertical-based power distribution, differential concepts still function as auxiliary

to categorical thinking that functions as an a priori tracing rather than a non-hierarchical cartography.

The basis for isolating McDonald's is not to critique this particular corporation for not showing fidelity to Deleuze and Guattari's concepts, for this would presuppose an intention on behalf of this corporation to do so; rather, it will be of some utility to demonstrate the disagreement between multinational corporate practices and the ideas of Deleuze and Guattari as a means to answer Žižek's accusation that these ideas actually enable contemporary corporate logics. There are confusing similarities between what Deleuze and Guattari describe as the rhizome and the practices of corporations, but these similarities are merely appearances – a league of representations.

II. The Rhetoric of McDonald's

One need not turn to the legion of texts that criticise the practices of McDonald's Corporation since McDonald's own publicly released annual report discloses the rhetorical devices it employs to ensure brand loyalty and the maximisation of profit. In releasing these reports to the public, doubtless in response to critics who have lambasted the corporation for lack of disclosure, McDonald's abides by one of its initial guiding 'ethics': namely, that trust is hard to earn and easy to lose. Rhetorically, releasing an annual report is partially designed to 'earn' that public trust and to maintain its global credibility as a dynamic, caring corporation sensitive to the needs of all its employees and customers. There are frequent appeals to the 'founding principles' of Ray Kroc, verging on the religious near-deification of their founder. The overarching ethical conduit by which McDonald's wants to be perceived is the association between food production and (moral) value. Nothing can be more personal than what one eats and what one believes, and so it is essential for McDonald's, in order to be prosperous, to tread in such a way as to appeal to a reductionist 'common value' that encircles a perceived majoritarian set of values. In doing so, the corporation produces a regulatory framework flexible enough to allow regional differences while still maintaining a totalising system of common relevant moral values. Nowhere is this false or negative difference more evident than in its business model, 'Freedom within the Framework'. This model, pictorially demonstrated in their 2004 report on Corporate Responsibility, is a series of overlapping 'spheres' governed by both a central nexus of locations and corporate revenues, and an encompassing outer sphere that unites the structure into a

whole. Three 'rhizomatic' elastic spheres issue from the central nexus, namely owners/operators, company employees and suppliers (Skinner and Bell 2004). Presumably, the 'freedom' within this framework is the expansive character of the three spheres by which the centre sphere is fed by titration of profits. As well, floating as if in a soup, are three corresponding aspects that determine the encompassing sphere: policies (good business conduct and environmental policy to become the best employer, to give back to the community which presupposes something taken away, and holding themselves in the highest possible ethical standards). These three determining aspects have a dubiety about them, and this is precisely due to their substitutability in responding to the dynamic demands of any regionalist conditions that may later impact upon the whole. This model is more of an organism than a Deleuzian BwO since its power rests in a power structure that is governed by the crude metrics of profit and amount of locations. Is McDonald's, despite its seeming 'rhizomatesque' features, still a centralised organism? According to Jim Skinner (Vice-Chairman) and Charles Bell (President and CEO),

> Decentralisation is fundamental to our business model – and to our corporate responsibility efforts. At the corporate level, we provide a global framework of common goals, policies, and guidelines rooted in our core values. Within this framework, individual geographic business units have the freedom to develop programs and performance measures appropriate to local conditions. We view this model as a source of strength.

Decentralisation within limits: That is, there is still a centralising feature of McDonald's model, and this is located precisely in those 'core values' it is 'rooted in'. The moral overcoding is fascicular, a 'root book' of values that regulate the corporate organism, ensuring that its claims of 'decentralisation' is a confused one, especially since it (a) is stated as 'fundamental', (b) operates according to a global framework and (c) is rooted in core values that regulate the peripheral functions of the corporate structure. In essence, it would appear that decentralisation has been loosely appended as a buzzword or vacuous homily. McDonald's also discloses more than it perhaps realises by claiming its corporate strength in accordance with its 'Freedom within a Framework' model, stating that it can maintain its corporate governance globally while being flexible enough in the particulars to cater to local and regional differences, pending that they do not violate the categorical unity. This effectively trumps any truly affirmative difference from engaging and altering the corporate totality, and so rather consigns difference to paltry

variations under a global framework that is itself inflexible. Ray Kroc remains the unseen religious figurehead (as McDonald's rather prefers to use cartoon icons by which to channel the 'divine' corporate influence), acting as a kind of 'Holy Ghost' that spiritualises and concretises the core values the corporation relies upon. Nowhere is this more apparent than in its motto: 'At McDonald's, we believe that good governance starts with good values'. Harking to a worn Platonic dictate on the construction of a State, McDonald's does not deviate far from the common sense notion of governance. Words such as 'governance' and 'value' are frequently repeated as ultimate signifieds by which we are expected to believe that indeed McDonald's upholds these terms in all its operations. And even if these values were being upheld, it is unlikely that they were selected democratically or that those who are employed at the lowest employment tier would be invited or encouraged to dispute these values. The looming figure of hegemony is most present when values are 'handed down' to be 'obeyed', even if they come in the guise of generally accepted consensus or are articulated in the most broad and vague terms.

McDonald's does not stop at seemingly appropriating (albeit badly) Deleuzian themes, but also makes blatant use of various postcolonial and postindustrialist terms such as 'stakeholders'. For example, its global 'sensitivity' is trotted out here: 'And whether it's called "good corporate citizenship" or "social responsibility," we take seriously our commitment to conducting our business in a way that respects the world around us and the issues that matter most to you', and

> we work toward responsible actions by understanding the perspectives and needs of our customers and other important stakeholders, by collaborating with experts to understand issues and opportunities and by inspiring the people in our system – company employees, owner/operators and suppliers – to share and act on these core values.

What are these issues exactly, and how can their relevance gain purchase on this reductionist, universalised and structurally empty 'you'? If McDonald's could not assume a common set of values, and if these values could be demonstrated not to hold for all persons for all times, the credibility of their regulative framework would be in jeopardy. In desiring to provide meals and a dining out experience that exceeds its customers' expectations, McDonald's once again blunders in assuming a common set of predictable expectations, what their content would be and therefore how to exceed them.[2]

As to the globalising structure of McDonald's, McDonald's relies on its 'Plan to Win' business strategy: 'We manage our worldwide

operations with McDonald's global Plan to Win, which identifies five P's that drive our business – Products, People, Place, Price and Promotion'. Apart from what may have been construed in the planning offices, a clever use of alliteration and a mnemonic device for better corporate encoding, we find that these five P's are as empty and vacuous as they are attempts at totalisation and reduction. Instead of considering the various aspects of their business as a rich dynamism, a *planomenon* of intercalated becomings, they have instead relied on a rigid stratification, an *ecumenon* of particular determinations that function in concert according to an overcoding moral set which euphemistically is dubbed their plan to win. We may take especial issue with this notion of winning, most notably as it is draped upon their core values, and pose the question as to what winning means. It is not merely a victory of maximising profits per quarter, but a moral victory as well – that the McDonald's worldview of what morally ought to be is realised and ensures the perpetuation of its regulative moral codes. McDonald's succinctly states,

> We provide a framework of common values, policies and business strategies and then empower our owner/operators, our suppliers and company staff to contribute in ways that reflect their unique expertise and local circumstances. Like other parts of our business, McDonald's commitment to corporate responsibility follows this 'freedom within a framework' approach.

Heavy yet most likely vacuous words like 'responsibility' are not innocuous additions to their corporate mandate as they seek to respond to mounting criticism that McDonald's is yet another cold, faceless, profit-accumulating machine that only provides homogeneity as its major export:

> Responsibility at McDonald's means striving to do what is right, being a good neighbor in the community and integrating social and environmental priorities into our restaurants and our relationships with suppliers and business partners . . . We have a responsibility to maintain our values and high standards as we provide food that is affordable to a wide range of customers.

And again,

> Our restaurants and drive-thru's will be clean, relevant and inviting to the customers of today and tomorrow. We have a responsibility to manage our business by integrating environmental considerations into daily operations and by constantly seeking ways to add value to the community.[3]

To what extent these 'environmental considerations' actually enter into McDonald's schema seems to be tacked on, and McDonald's

claim to the addition of value to a community sounds hollow without further qualification. One may question how a McDonald's actually adds value to any community rather than reduces value to a flat common set of prefabricated corporate ideals, low-income employment, a menu of false choices, perpetuating animal cruelty, diminishing the profitability of smaller non-chain restaurants, infantilising the consumer public, the degradation of fine cuisine to mere convenience, massive garbage production and contributing to rampant obesity. In what way is McDonald's representing 'responsibility'? In recent years, 'healthy' choices have been added to the menu in response to a growing concern over the deleterious effects of fast food.

What is this 'healthy' turn? On pages 6–8 of the report, McDonald's repeats its mantra of food = value by making its first argument one of *ad populam* (the average consumer's values, highlighting a specific case example of an average consumer, quite politically inflected by the selection of a visible ethnic minority) and then moves towards an appeal to authority (a semi-alarmist message by Professor Paul Gately, member of McDonald's Global Advisory Council in Balanced Lifestyles). Dr Gately does not make a firm connection between skyrocketing overweight and obesity rates and the steps McDonald's is taking to help alleviate the problem, but rather states that,

> In a world where technological advances and our risk-averse culture have removed opportunities for children to be physically active, we need to find ways to give kids positive experiences of physical activity, exercise and sports. For children, what's critical is engagement and fun – and that's something McDonald's does very well.

After Gately shifts the blame for child obesity to broad social conditions of technology and safety (making sweeping generalisations, we might add), he asserts that McDonald's offers the following solutions: (1) providing 'fun' (which is a vacuous signifier), 'engagement', food choices within an 'improved nutritional matrix', convenience and good taste. Gately points to McDonald's as a 'powerful vehicle of change', and sees McDonald's role as provoking community changes via business and governmental partnerships to support and promote physical activity for children. The connection between the products McDonald's serves and physical activity among children is disparate and disingenuous at best.

On the whole, it seems, McDonald's is still a fascicular corporate organism abiding by inflexible moral schemas. Despite its claims to decentralisation and its appearance of being an immanent entity, these are illusory at best, and are still transcendent apparatuses of capture.

One may see how a facile engagement with the works of Deleuze and Guattari may actually perpetuate the stratified ends of corporate expansionism and proliferation, although these seem to be light concessions and nominal utilisations of theory terminology.

III. Fear Capital

McDonald's has only conformed to environmental and health standards when external pressure has been applied, and largely for reasons of public relations. For example, McDonald's has switched to the use of organic milk in its milk-based drinks, and uses coffee beans certified by the Rainforest Alliance. In addition, it has also aimed to reduce, if not entirely eliminate, its polystyrene packaging. However, the reason for embracing these environmental practices has a bearing on market practices that seek to broaden consumer appeal during a time when environmental issues are more predominantly of concern to the consumers. Interestingly enough, no mention of past corporate liability is made – given that McDonald's, among many other corporations, had contributed to environmental degradation for decades, thereby making McDonald's culpable for its share of deleterious environmental impact. Nor does McDonald's new turn towards environmental sustainability and corporate responsibility address the issue of overstressed farmland and standardised destruction of arable land used as feedlots for cows. The failures and contradictions in McDonald's Corporation's attempt to foster a new 'green' and 'fair' image are legion as they continue to patronise agribusinesses over smaller local farms, have quashed all attempts at allowing a unionisation of its workers, abetted the increasing Americanisation of global trade and American cultural imperialism, continued to limit biodiversity through dense central food processing facilities, and the unsustainable use of water and energy to produce every one of its menu items. In sum, although the corporation reports its commitment to sustainable practice, it is unsurprisingly a public-relations smokescreen. As well, McDonald's continues to direct its marketing enticements towards children in order to ensure lifelong brand loyalty, and this is effectively done through collaborative product tie-ins with toy manufacturers and movie companies.

McDonald's, like many corporations that utilise the same or a similar model, seems to operate on a plane of immanence since it need not refer to, or depend on, a transcendent state apparatus. It operates its flows through network relations as a series of capital accumulations. Deterritorialisation and uncoded flows – essential conditions for the

spread of free market economics – have indeed overcome the shadow of state imperialism as it has been generally defined; however, as Hardt and Negri point out, the segmentarity of the social has become more pronounced rather than less (Hardt and Negri 2000: 366). Economic theorists like Leo Strauss were instrumental in advocating an economic model with a minimum of government interference, a view championed and put into action by neo-conservatives like Ronald Reagan, Donald Rumsfeld, Richard Perle, George W. Bush and so on. Once the 'emancipation' of the market could engage in a regulatory axiomatisation supplanting the presence or perceived need for 'big government', welfare-state policies were downsized or phased out entirely to such an extent that even the then-President Bill Clinton was forced by market pressures to abandon his campaign promises of restoring social spending. One of the significant, yet under-examined, shifts was in the management of the US defence programme. Despite a spike in defence spending in the last decade, a disproportionately small amount of this money funds troops or their equipment. Ironically, a lion's share of defence funding is earmarked for civilian salaries of those who work for Department of Defense contracted corporations such as Lockheed-Martin, Raytheon and so on. Under the guise of defence budgets directly financing military personnel, the majority is spent on contracting corporations that will set up factories to increase domestic economic stability. In this way, the defence budget is tantamount to a jobs programme that replaces other forms of more socially based fiscal stimulus initiatives. When lobbyists favourable to these corporations, or former employees of these corporations enter into prominent positions of political power, political interests can become confused with corporate interests, ensuring that the state becomes economically beholden to these contracted corporations for fear of creating massive unemployment. The second irony concerns the apparent purpose of increased defence spending: the worst possible scenario for the sustainability of what Eisenhower first coined as the military-industrial complex is for there to be a war since funds would no longer sufficiently finance the jobs programme that corporations operate without spending more money on the war as well. The rather Orwellian scenario of increased defence spending when there is no war is part of a concerted fear programme that ensures the rigidifying of social segmentation. 'Fear of violence, poverty, and unemployment is in the end the primary and immediate force that creates and maintains these new segmentations' (Hardt and Negri 2000: 339). The choice between increased defence spending for capital accumulation

and that of war is captured in the disjunction Deleuze and Guattari identify:

> Either the State has at its disposal a violence that is not channeled through war – either it uses police officers and jailers in place of warriors, has no arms and no need of them, operates by immediate, magical capture, 'seizes' and 'binds', preventing all combat – or, the State acquires an army, but in a way that presupposes a juridical integration of war and the organisation of a military function. (Deleuze and Guattari 1987: 352)

In the case of the US defence industry, there would appear to be both, working curiously at cross-purposes.

The question would emerge as to what sort of 'fear' McDonald's utilises in order to ensure its place in sustaining a severe socio-global segmentation. Very much like the above US Department of Defense example, the fear is primarily of economic provenance.

IV. McNomadology?

Domination and resistance are always at war in what Deleuze and Guattari call the body without organs. In this perpetual in-folding (*Zwiefalt*), the body (which need not be a physical body) is perpetually dismantling and remaking itself. The organism resides as a stratum on the BwO: 'a phenomenon of accumulation, coagulation, and sedimentation that, in order to extract useful labour from the BwO, imposes upon it forms, functions, bonds, dominant and hierarchised organisations, organised transcendence' (Deleuze and Guattari 1987: 159). If we take the BwO as the 'scene' or the 'plane' upon which a war machine is organised, we must take care not to hastily declare this an ideological aspect. If taken just on the level of the axioms, nomadology *appears* to share a zone with the methods of McDonald's. The first axiom plainly states that the war machine is exterior to the state apparatus (Deleuze and Guattari 1987: 351). As we have mentioned, the flow of contemporary capital operates with flows that are freed from the state; however, it would be too quick to make an equivocation between corporation and war machine. If we are to consider corporations like McDonald's as employing a strategy similar to Deleuze and Guattari's example of the game Go, we find that perhaps each individual franchise is like that anonymous piece that operates situationally, 'bordering, encircling, shattering' (Deleuze and Guattari 1987: 353). Unlike Chess, for McDonald's there is not the instance of occupying maximum space with a minimum of pieces since the McDonald's model operates by

ubiquity and proliferation of its franchises. As well, its operations model offers a minimum of quality at the highest quantity, recoding quantity as quality.[4] Go 'succeeds' by deterritorialising from within whereas Chess must confront from the outside. But whereas Go thrives upon a smooth space, free of the metric and striated space of Chess (the state), McDonald's still employs striation at the micro-level, the stratum of the organism that makes McDonald's its own kind of state – a micro-state, despotic in the way it organises itself between the governing and the governed inside its corporate body. If there was a war machine inside McDonald's, it would only seem to be a valorisation of liberal revolution: the formation of unions and demanding of universal rights. Rather, the war machine would utilise the aspects of labour prized by the contemporary state: mobility and flexibility. The labour force would not ask permission to form a union, but would rather form clandestine packs and gatherings, using the corporate methods of extreme efficiency for viral purposes. Far from becoming a Marxist romanticism that aims to reify the worker as an emancipated subject, the labour force as war machine would take on the role of non-subjectifiable, anonymous Go pieces, virally consuming from within and deterritorialising the McDonald's structure.

When once capital had a strategic set of purposes, usually linked with the state's purposes, it has since become almost Spinozist: it wishes to persevere in its own aspect, to continue accumulating without any further purpose but accumulation itself. Blind, vagabond, capital becomes a nomadic accumulator with the sole purpose of growing itself: capital as cancer.[5] The method of proliferation that McDonald's uses as it franchises itself across the globe appears to have this cancerous or nomadic element. This, however, comes with at least one crucial difference: the method of proliferation more resembles that of a religious model than it does a nomadic distribution. McDonald's grants the authority for another individual or group to conduct commercial operations on the condition that the franchisee conforms the root principles as set down by the corporation's laws. Minor variations are permitted if not encouraged as long as these variations do not violate the core principles. This transcendent ordering mechanism that regulates each component, each franchise, is partially what makes McDonald's more of an organism than a war machine.

If we follow Deleuze and Guattari's definition of rhizome with its six principles (connectivity, heterogeneity, multiplicity, asignifying rupture, cartography and decalcomania), we find moments where corporations like McDonald's seem to abide by a rhizomal programme. Most notably,

the aspect of asignifying rupture most closely resembles the decoding flows and de/re-territorialising strategy of capital, but more specifically, a decentralised corporate structure allows for local breakdowns and ruptures that do not endanger the whole. If a McDonald's restaurant fails to secure a certain profit level to keep it viable in one area, it can be shut down and reopened elsewhere. Since the success of the corporation is not contingent upon a rooted and fixed spatiogeography, it can merely take up operations elsewhere. The second strongest rhizomal aspect would be McDonald's capacity for cartographic expansion; it has free ingress and egress as a corporation in being able to enter and exit local and national markets throughout the globe. However, its internal structure does not admit of this aspect, preferring to manage its employees according to a rigid hierarchy. Multiplicity is demonstrated through domination and absorption, forming a unity of multiples that contain the source and target cultures in any given market in addition to its franchise proliferation mechanisms. However, this, too, does not qualify as an actual multiplicity since this form of domination and subversion is somewhat Hegelian in nature, forcing a synthesis by means of the *Aufhebung* of the cultural market it inhabits. Although recent trends in corporations like McDonald's have forced them to recontextualise their practices given the current increase in environmental concerns, this is not auto-derived as much as it is externally imposed by both a response to critics and an attempt to sustain consumer trust. One could also say that McDonald's employs rhizomal connectivity through the ability to construct an aggregate labour force wherever it happens to be. However, this too succumbs to a process of labour exploitation and subjugation. Even in this age of vector and network capitalism, corporations are still beholden to similar processes for their own sustainability as profit machines. A rhizome does not need to appeal to reactive methods in order to expand itself, whereas a corporation still contains within it the relatively unchanged phases of capital recovery towards expansion such as performing management changes, retrenchment and divestiture, restructuring, market/product reorientation, improved controls, improved marketing, and increase in plant and machinery expenditure (or improvements thereupon). With such methods that would be considered reactive, even today's corporations lack the critical apparatus and structural flexibility to implement a truly rhizomal programme.

There is also the darker shadow cast by McDonald's when it subordinates local customs and eating habits while claiming to mobilise local talents and encourage cultural diversity by the artificial appendage

of adding 'local' menu choices to its usual fare. Reducing culture to clothing and cuisine only serves a market purpose that simplifies and sanitises that culture for 'quaint' consumption by a presumed elite homogeneous group that can regard said cultures as secondary to their own. McDonald's effectively makes cultural consumption – culture based on mercantile utility – 'safe' for both the source and target cultures. For the source culture that is sanitised and emulated, it provides the illusion of cultural sensitivity. For the target culture that may consume these items, it provides a sense of satisfying the 'exotic', a false communion with the Other that serves to assuage guilt. For the source culture, a division may take place that recodes the cultural form from which the new menu option derives, a schism that may cause the consumer to become a flaneur in one's own culture. As a form of cultural and ecological imperialism, McDonald's – as well as other global fast food chains – aims to construct a new programme of eating habits as part of the larger programme of marketing it as an 'experience'.

V. Žižek contra Deleuze

One of the enduring criticisms Žižek makes against Deleuze in *Organs without Bodies* would be in the manner by which Žižek flattens and reduces Deleuze's insight of the rhizomatic multiplicity as being at odds with itself: between a leftist counter-capitalist ideology and being decidedly apolitical. Amid the raft of charges that Deleuze is merely touting ideology, that there is a secret complicity with Hegelianism, and an uncritical admiration of Spinoza, the most serious charge for the purposes of this article is that Deleuze and Guattari somehow provide the tools necessary for corporations to bolster their legacies of global power. Žižek goes on to criticise the Deleuze and Guattari project indirectly, especially in dubbing Hardt and Negri's *Empire* as a naïve revision of socialism (Žižek 2004: 196). What is fundamentally lost in Žižek's accusation is contact with the *esprit* of *A Thousand Plateaus*; namely, that Deleuze and Guattari are not advancing a concrete socio-political programme, but rather are providing readers with a conceptual toolkit. For Žižek to make the leap to the consequences of (mis)using those conceptual tools is an exercise in speculation since it would presuppose that the tools themselves have only one possible use, which in Žižek's criticism would be to strengthen the hand of late capital. To be fair, this is but one of perhaps several possibilities, but as we demonstrated supra, the current operational methods of contemporary corporations like McDonald's do not and

cannot adopt Deleuze and Guattari's concepts with strict fidelity without endangering their earning potentials derived from hierarchical controls. If corporations like McDonald's were to make use of those tools according to the effects they would inevitably produce, the rhizomatic nature of these tools would reorganise what we understand as the multinational corporation into a model incommensurate with economic domination and control. A 'rhizomatic' corporation would be devoid of any hierarchical structure, and would not operate according to a preset of conditions that orients its profit-accumulating activities. As well, a rhizomatic corporation would not have homogenising social effects, but would actively connect with, and produce, differences based on cultural, aesthetic, political and economic affects. We should not confuse dominant capitalist nations with their continued deindustrialisation via the exporting of labour to developing nations as an example of decentralisation since the central profit-accumulating apparatus still resides in the place of the corporation's provenance. Moreover, if the corporate structure abided by a rhizomal model, there would be free and unobstructed access to all employment roles and privileges according to the principles of connectivity and heterogeneity; there would be no 'ladders' to climb since every point of a corporate rhizome would have connective accessibility. Despite the increase in 'interfacing' which appears to grant the worker more decision-making capacity to conduct 'cooperative' labour as a socially interactive force, the categorical mandate of the corporation is still centred on the means by which to gain control over the worker-subject. Although more control is vested in the worker-subject through cooperative labour, the subjectivity of the worker must conform to the preconditioned set of expectations to avoid any deviations. And so, akin to Isaiah Berlin's notion of negative freedom, the worker-subject's freedom is within a given set of parameters that surreptitiously conform to corporate interests. Freedom within limits acts as a kind of enclosure mechanism that assures some degree of distance control of the worker-subject.

One of the added productions beyond commodities for immaterial labour in a post-Fordist economy is that of communication – the social relation of information capital. The inscription of the worker-subject into a wider spectrum of the production-consumption network also has as its outcome the production of a particular kind of subjectivity as a goal. This kind of subjectivity differs from the variety that is generally perceived as celebratory of free choice: it is a subjectivity that grants the illusion of self-mastery through choices that still must come to the same result (if A must go to B, the creative worker can devise any method

so long as B is reached). It is also the variety of subjectivity that, rather than becoming enslaved to the machine, one is instead subjected to it. As well, the 'new' subjectivity belonging to immaterial labour proper still abstracts from the individual, still reduces that worker to a 'knowledge capital dispensary' in a relay network that is governed by an overarching set of corporate ends. The value of the knowledge that enters into this relay is judged on how well it advances the goals of corporate efficiency, imposing a system of valuation even upon the dissemination and cooperation of information relayed in a labour network.

What remains in current corporate trends, as exemplified by McDonald's, and despite the movement towards decentralising corporate networks, is that the appearance of the rhizome is just that: an appearance. Contemporary capitalism by whichever name we give it – vector, cognitive, network, grounded theory – still plays a predominant role in the shaping of subjectivity on behalf of subjects, even if the methods are clandestine. A rhizomal corporation, if such a thing could ever exist, would be a multiplicity, would allow the component labour within it to develop according to its own cartography rather than have a tracing imposed upon it.

Žižek makes two critical mistakes in his reading of Deleuze. First, he reads Deleuze as 'pro-capitalist', which assumes Deleuze is valorising capital rather than explaining some of its tendencies without making valuations that have no place in a conceptual project. From there, Žižek imputes a variety of consequences that would result from a *particular* application of such concepts. Second, Žižek's understanding of the rhizome appears flawed given that a true application of the rhizome to multinational corporations will prove incommensurate to the existing structure of either. Instead, what we may be left with are corporate trends that borrow representations construed from these concepts to further their own agendas. What our McDonald's example demonstrated – and what presumably a similar study on other multinational corporations would as well – is that a representation of a rhizome is not a rhizome, but just another apparatus of capture.

Notes

1. One deleterious use of 'deterritorialisation' and recoding of flows, albeit not with full fidelity to the way Deleuze and Guattari employ these terms, has been in the way Wal-Mart has utilised predatory pricing to ensure a zone of commercial control in any given area that it 'captures'.
2. Aside from the ambiguous 'subject' this statement alludes to, there appears to be a quiet equivalence between social responsibility and corporate citizenship.

3. Nested in this statement is a rather non-environmental consideration: the contentious use and encouragement of drive-thru's. Recently, McDonald's partnered with Sinopec, China's second-largest oil producer, to promote and encourage the use of personal motor vehicles at its restaurant locations in East Asia. This corporate partnership adds substance to the seemingly odd use of the word 'relevant' in relation to drive-thru's.
4. This quantity = quality distinction is an insight formulated by George Ritzer's book *The McDonaldization of Society* (1993), wherein he also isolates three other McDonald's characteristics such as uniformity, calculability and a very narrow definition of efficiency.
5. This claim is drawn from Deleuze's occasional comparisons between cancer and capitalism as well as McMurtry's seminal article 'The Cancer Stage of Capitalism'. I make an attempt to clarify this distinction a bit further in 'Transcendent and Immanent Capital' in *Azimute* (2004: online).

Forum Introduction: Sense, Sensation and Deleuze's Transcendental Empiricism

Peter Hertz-Ohmes, Leyla Haferkamp, Arno Böhler

The three papers in this forum were independently presented at the Second *Deleuze Studies* Conference in Cologne, August 2009. That they belonged together was quickly recognised. Each author focuses on the interplay of sense and sensation as the crux of Deleuze's transcendental empiricism. But note that each author takes the interplay as primary. Only given the interplay can it propose to the philosopher Deleuze possible approaches to its workings. Thus in all three papers sense and sensation are outcomes, just as transcendental empiricism is an outcome. All three papers, already familiar with Deleuze, work back in order to work forward. Sense and sensation, as well as their logics, turn out to be provisional as only one way of reaching another goal, something that makes all this effort worthwhile.

But as long as these concepts happen to be available at the moment, they suggest the following assertions: Sense without concomitant sensation is void, and sensation without correlative sense is totally indistinct. Yet there has never been a need to start from scratch. The differential material of sensation is always already immanent, although for the most part not actualised, and the fractal, self-organisational equipment of sense is also always already immanent, even if for the most part virtual and unrealised.

Humans are condemned or privileged to enter at birth into a fully furnished, fully interpreted world. The majority takes this world for granted. Many opt out, hoping for a better deal elsewhere. But a few affirm their existence by choosing to live again to the fullest the human condition as it has been passed down to them, affirming through self-effacement a truly sensational world in every possible sense that can be made to shine through them with the splendid impersonality of a fourth person singular.

Fourth person singulars constitute a manifold of centres in an eccentric world. All together they are one but each is unique, different

from all the others. Each is a monad, *a life*, what in the present world takes form as the materialised sense of a life: not biography but Event.

Baumgarten may not have been an exciting writer or a major philosopher, and he hardly rates a readable biography, but through him shines the inspiration of an aesthetics that gave impetus to a rebellious Romanticism. Nietzsche may have been a loner and a misfit who overstated his ideas because no one listened, but through him shines the heat of a revelation whose political consequences continue to play out against an all-consuming, consumption-oriented nihilism. And what about Deleuze himself? What shines through Deleuze is the active acceptance of the role he as actor must assume together with his immanent director not so much to ensure the integrity of his own works but to challenge the self-serving parochialism of so much institutional philosophy.

Forums like this are meant to put some spark into the philosophy business. The authors welcome feedback.

Analogon Rationis: Baumgarten, Deleuze and the 'Becoming Girl' of Philosophy

Leyla Haferkamp University of Cologne, Cologne

Abstract

Baumgarten's Enlightenment *Aesthetica* provides an important philosophical *analogon* to Deleuze's alignment of the 'logic of sense' and the 'logic of sensation'. By linking serious reason with its 'other', frivolous feeling, the book greatly influenced Herder and the Romantic movement. Baumgarten called aesthetics 'logic's younger sister'. Like Deleuze he propagates nothing less than the 'becoming-girl' of philosophy.

Keywords: aesthetics, feeling, Enlightenment philosophy, becoming-other, Baumgarten, Deleuze

> 'Reason is a kind of feeling.' (Deleuze 1991: 30)

Seen in retrospect, Alexander Gottlieb Baumgarten (1714–62) is no doubt one of the minor figures in the syllabus of eighteenth-century German philosophy. This is probably not much of a surprise given that he died at the age of 48 without having completed his most significant book *Aesthetica* and wrote almost exclusively in Latin. *Aesthetica*, for instance, was translated into German in its entirety only two years ago, and, chronologically speaking, it was literally stuck somewhere between Leibniz and Kant. Baumgarten, however, was not only a rigorous logician in the Wolffian tradition of mid-eighteenth-century Germany; not only an 'eminent analyst' as Kant called him in *Critique of Pure Reason* (Kant 2003: 22n). Kant, in fact, is known to have used Baumgarten's *Metaphysica* (1739) as the basis of many a lecture in Königsberg, but Baumgarten was also a poet who wrote verses in Latin on a daily basis. In an early piece entitled *Meditationes philosophicae de nonnullis ad poema pertinentibus* [Philosophical Meditations on Some Requirements of the Poem], he combined these two interests in a first theory of sensibility, the prototype of what he would later establish as the first systematic theory of aesthetics.

The attempt to align the philosophy of Baumgarten, whose work is often associated with the rigid rationalism of the Wolffian tradition, with that of Gilles Deleuze, whose writings contain no direct reference to Baumgarten's work, may at first glance seem far-fetched. There are, however, parallels between the two philosophers, especially when the focus is set on the aspect of 'aesthetic intervention'. In other words, the way Baumgarten invents aesthetics as a philosophical category makes him one of the precursors of Deleuzian philosophy.

What relates Baumgarten and Deleuze in general is their aim to strengthen the link between life and thought from within a philosophical framework that involves seemingly incompatible systems of logic. In particular, this affinity lies in their mutual interest in depicting the interrelations between sense and sensation. As such, Baumgarten's work provides an important historical *analogon* to Deleuze's alignment of the 'logic of sense' with the 'logic of sensation' and to his development of a topology of complementarity.

As the bold attempt to lend sensation its own logical parameters, Baumgarten's *Aesthetica*, based on lectures held between 1750 and 1758, has served to establish aesthetics as a philosophical discipline in its own right, thus marking a turning point in the philosophy of the Enlightenment. It is in this book, categorically dismissed by Kant as 'the disappointed hope... of subjecting the criticism of the beautiful to principles of reason, and so of elevating its rules to a science', that Baumgarten is at his most radical (Kant 2003: 22n). The Neo-Kantian philosopher Ernst Cassirer, who dedicates a considerable amount of space to Baumgarten's two-fold model in his *Philosophy of the Enlightenment*, reverses the Kantian verdict and acknowledges 'Baumgarten's decisive historical merit' as truly *vernunftskritisch*. '[H]is real intellectual accomplishment', Cassirer writes,

> consists in the fact that through his mastery of the subject he became especially conscious of both the intrinsic and the systematic limitations of formal logic. As a result of his consciousness of these limitations, Baumgarten was able to make his original contribution to the history of thought, which lay in the philosophical foundation of aesthetics... Thus aesthetics evolves from logic, but this evolution discloses the immanent weakness of traditional scholastic logic. (Cassirer 1955: 338–9)

To have 'invented' aesthetics as an independent discipline is, in fact, Baumgarten's major contribution to philosophical discourse. One should note, however, that at its moment of inception aesthetics was much more inclusive than the philosophical investigation of art and beauty, to which it tends to be narrowed down today. With

aesthetics, Baumgarten developed nothing less than a general theory of sensibility with its own gnoseological faculty that produces a specific kind of knowledge. His aesthetics was a theory claiming epistemological relevance for sensual perception. Along these lines, the first section of *Aesthetica* delivers a programmatic definition of the new science that defies the traditional categories of thought: 'Aesthetics (as a theory of the liberal arts, as inferior cognition, as the art of beautiful thinking and as the art of thinking analogous to reason) is the science of sensible cognition' [*Aesthetica* (*theoria liberalium artium, gnoseologia inferior, ars pulcre cogitandi, ars analogi rationis*) *est scientia cognitionis sensitivae*] (Baumgarten 2007a: §1, my translation).

With the primary aim to integrate aesthetics into the realm of rational thought as the *analogon rationis*, Baumgarten draws extensively upon Leibnizian epistemology, which he modifies to serve as the basis of the new 'science of sensible cognition'. Not only does he emphasise the interconnections between the *gnoseologia superior* of the sense-making ratio and the *gnoseologia inferior* of sensation, but, even more importantly, he also underscores their genetic unity, which he regards as grounded in the dark recesses of the *fundus animae*. In *Aesthetica*, the *fundus animae* figures as the source of all kinds of perception, a domain that is of interest to psychology though it is largely neglected by philosophy itself; it contains that which remains forgotten, unconscious and unpredictable (Baumgarten 2007a: §80). A general definition of the *fundus animae* is provided in *Metaphysica*: 'The soul has dark perceptions. As a whole, these perceptions form the foundation of the soul' (Baumgarten 2004: §511). Despite all its obscurity, however, the *fundus* does not lack truth. 'What is abstraction, if not a loss?' Baumgarten asks, noting that the notion of fallibility and the very dichotomy of true vs. false are produced not by dark perception but by rational abstraction (Baumgarten 2007a: §560).

Despite resonances in terminology and approach, Baumgarten's and Deleuze's theories of the sensible are, needless to say, anything but identical. A conceptual affinity, however, can be detected in *Difference and Repetition* when Deleuze refers, without mentioning Baumgarten's name, to the founding moment of aesthetics:

> It is strange that aesthetics (as the science of the sensible) could be founded on what *can* be represented in the sensible. True, the inverse procedure is not much better, consisting of the attempt to withdraw the pure sensible from representation and to determine it as that which remains once representation is removed (a contradictory flux, for example, or a rhapsody

> of sensations). Empiricism truly becomes transcendental and aesthetics an apodictic discipline, only when we apprehend directly in the sensible that which can only be sensed, the very being *of* the sensible: difference, potential difference and difference in intensity as the reason behind qualitative diversity. (Deleuze 1994: 56–7)

Despite its anthropocentric tendency that sets it apart from Deleuzian philosophy, Baumgarten's aesthetics will have intervened in the philosophical discourse of his time with a force comparable to the intervention that Deleuze has made in twentieth-century philosophy. Baumgarten aimed at maintaining the balance between the rational and the sensual and set the emphasis on the 'transitions' between the two, the superior cognition of rationality and the so-called *inferior* cognition of sensuality. Already Leibniz, in his *Discourse on Metaphysics* (1686), had addressed the inferior domain, the domain of confused knowledge as opposed to distinct knowledge, as the mode of knowledge specific to art: 'When I can recognise one thing among others without being able to say what its differences or properties consist in', Leibniz wrote, 'my knowledge is *confused*. In this way we sometimes know *clearly*, without being in anyway in doubt, whether a poem or a painting is good or bad, because there is a certain *je ne sais quoi* which pleases or offends us' (Leibniz 1998a: §24). In Baumgarten's context, this inferior faculty does not simply receive a pejorative label for its less valuable and hence less favourable status; its inferiority is, rather, suggestive of a spatial model that renders sensation the crucial 'underlying' layer of the superior faculty of sense.

Baumgarten's modification of Leibnizian thought consists in his integration of the seemingly 'flawed' inferior faculty into the philosophical discipline of aesthetics as its unique mode of cognition. In fact, the confused cognition of sensuality becomes the one and only true link between the two ends of the spectrum, that is the level of rational knowledge on the one hand and the obscure level of what Deleuze would later call, in direct reference to Leibniz, unconscious micro-perceptions on the other. Aesthetics originates *in medias res* to establish the connections between the rational and the irrational:

> One could say that confusion is the mother of error. My answer to this is: it is a necessary condition for the discovery of truth, because nature does not make leaps from obscurity to distinction. Out of the night dawn leads to noon … We do not recommend confusion, but rather the amendment of cognition insofar as a necessary amount of confused cognition is mixed into it. (Baumgarten 2007a: §7, my translation)

Interestingly, this sounds much like an echo *avant la lettre* of Deleuze and Guattari's statement: 'To be present at the dawn of the world. Such is the link between imperceptibility, indiscernibility, and impersonality – the three virtues' (Deleuze and Guattari 1987: 280).

Baumgarten's notion of virtue is, no doubt, still closely related to the anthropological integrity of the individual (Baumgarten 2007a: §7). This integrity, however, can only be attained if one explores the domains beyond the confines of the *res cogitans*, and it is for this reason that Baumgarten attempts to establish the link to the inferior depths of consciousness, despite all the challenges posed to rational reasoning. Via the *analogon rationis*, a faculty that is at once 'analogous' to and decidedly different from the *ratio* itself, he paves the way for the 'becoming aesthetic' of reason.

Deleuze, in his reading of Hume's *A Treatise on Human Nature*, draws attention to Hume's interest in

> the problems of animal psychology, perhaps because the animal is nature without culture: the principles act upon its mind, but their only effect is a simple effect. Not having general rules, being held by the instinct to the actual, lacking any stable fancy and reflective procedures, the animal also lacks history. This is precisely the problem: how to explain that in the case of humanity, culture and history are constituted in the way that the fancy is re-established, through the resonance of affections within the mind. *How can we explain the union of the most frivolous and the most serious?*. (Deleuze 1991: 60)

From the Deleuzian perspective, if we consider Baumgarten's project as an attempt to conjoin the most frivolous and the most serious, we should note that he does so by setting the *analogon rationis* between the two realms. What is addressed by the term is less an analogical similarity to reason than an ongoing correspondence between Reason and its Other. Already placed by Christian Wolff in the rubric of empirical psychology (Wolff 1968: §506), the term *analogon rationis* originates from the domain of animal psychology, and is mentioned as such in Leibniz's *Monadology* (1714) (Leibniz 1998b: §26, §28). Hence, Baumgarten's use of the syntagm in the context of human sensual cognition not only emphasises the human being's hitherto neglected instinctive heritage, it also renders rationality complementary to the realm of the irrational. Thus, the aesthetic intervention brings about, in a very Deleuzian way, the *becoming animal* of the man of reason.

Furthermore, in order to underscore the clear yet confused character of sensible cognition, Baumgarten makes use of the term *haecceitas*

(haecceity), which he borrows from Duns Scotus. Unlike *quidditas*, by way of which the given object is rendered part of a typology, haecceity, following the dictum '*Haecceitas est singularitas*', addresses that singular property which lends something its individual difference. Baumgarten employs this term to emphasise the immediacy of aesthetic cognition, an immediacy that sets it apart from the superior faculty which, in order to attain clear and distinct perceptions, constantly engages in series of intermediate operations based upon reflexion and abstraction (Baumgarten 2007b: §755). Baumgarten's haecceity is not unlike Emily Dickinson's 'certain slant of light', the unique yet inexplicable property that constitutes the driving force behind what he calls *impetus aestheticus* and its ability to incite 'vehement' affects (Baumgarten 2007a: §78).

In the case of Deleuze and Guattari, the concept of haecceity is used in a novel sense that does away with forms and subjects, 'in the sense of an individuation which is not that of an object, nor of a person, but rather of an event (wind, river, day or even hour of the day)' (Deleuze and Parnet 2002: 155, translator's note), or as 'a mode of individuation very different from that of a person, subject, thing, or substance' (Deleuze and Guattari 1987: 261). While forms and subjects belong to the plane of organisation, haecceities, 'modest and microscopic' (Deleuze 1995: 141), are pre-personal intensities that circulate the plane of consistency, where 'it is the entire assemblage in its individuated aggregate that is a haecceity' (Deleuze and Guattari 1987: 262). Interestingly, in the Deleuzian context it is the girl that is the very epitome of haecceity:

> The girl is certainly not defined by virginity; she is defined by a relation of movement and rest, speed and slowness, by a combination of atoms, an emission of particles: haecceity. She never ceases to roam upon a body without organs. She is an abstract line, or a line of flight. Thus girls do not belong to an age group, sex, order, or kingdom: they slip in everywhere, between orders, acts, ages, sexes; they produce n molecular sexes on the line of flight in relation to the dualism machines they cross right through. The only way to get outside the dualisms is *to be-between, to pass between, the intermezzo*. (Deleuze and Guattari 1987: 276–7, emphasis added)

In *Aesthetica*, the *analogon rationis* that 'crosses right through' also corresponds to the figure of the girl insofar as Baumgarten refers to aesthetics as 'logic's younger sister' (Baumgarten 2007a: §13). The analogy connotes on the one hand both the frivolity and the vivacity of aesthetics as opposed to the seriousness of formal logic, and on the other hand it highlights the genetic relation between the sensual and the rational.

As Deleuzian philosophy seeks the reversal of the relationship of the rational and the sensual, according to which the 'superior' faculty evolves from the 'inferior depths', the younger sister becomes, in actual fact, the older one. Thus Deleuzian philosophy retains its share of the obscure and the confused, just as it always retains something of the chaos of the plane of immanence in its concepts (Deleuze and Guattari 2003: 118).

Baumgarten's work is a first moment in the reversal of the relation between sense and sensation, a moment that would become a seminal impulse for German romantic thought, whose importance for Deleuze is not yet charted with enough precision. Baumgarten's aesthetic experiment stands at the beginning of a movement that 'feels' and acknowledges the birth of philosophy from aesthetics. After all, Johann Gottfried Herder's praise of Baumgarten, which posits the rationalist philosopher as the precursor of the (romantic) tendencies aimed at thwarting the rationalistic doctrines of the Enlightenment, could easily apply to Deleuzian philosophy, as the mode of thought concentrating on the in-between of sense and sensation:

> The human soul lies before him, in its sensuous – that is, its most effectual and vivid – parts, like an enormous ocean that even in its calmest moments seems full of waves that are lifted up to heaven: there I place you, O philosopher of feeling, as on a high rock jutting out amid the waves. Now gaze down into the dark abyss of the human soul, where the sensations of the brute shade into the sensations of man, and as it were commingle with the soul from afar; gaze down into the abyss of obscure thoughts, from which there subsequently arise drives and emotions and pleasure and pain. Place the feeling of beauty where it belongs: between the angel and the animal, between the perfection of the infinite and the sensuous, vegetal gratification of cattle. [...] If you know the workshops of my animal spirits, then show me the spirit of beauty that courses through my veins [...]; show me beauty instead of conviction and reason and truth. Show me how the impressions in my sense organs become images in my soul, how my imagination pours rapture into my veins and that very moment weaves a mist around my faculty of reason. (Herder 2006: 44)

The Time of Drama in Nietzsche and Deleuze: *A Life* as Performative Interaction

Arno Böhler Universität Wien, Wien

Abstract

Nietzsche's model of eternal return triggers a drama of affirmation, the overcoming of a simple miming of our ancestors in favour of an active participation in the counter-actualisation of hidden potentials in recurrent events. Based on a close study of Zarathustra's struggle to free himself from a suffocating nihilism, the paper focuses on the revelatory caesura that ushers in what Deleuze calls the third synthesis of time, a time of 'doing' rather than reflection.

Keywords: Zarathustra, eternal return, caesura, syntheses of time, drama, Deleuze

> After all, since we are the products of earlier generations, we are also the products of their aberrations, passions, mistakes, and even crimes. It is impossible to loosen oneself from this chain entirely. Even if we condemn those aberrations and consider ourselves released from them, we have not yet overcome the fact that we are derived from them. (Nietzsche 1999a: 270, my translation)

This passage by Friedrich Nietzsche, from his second untimely investigation *On the Use and Abuse of History for Life*, gives us a clue regarding what it means to become a living being. A life starts precisely with the performance of an act of repetition. It comes not with some repetition of the future in which 'the man without qualities' reveals the vastness and joyful brilliance of the empty form of time on the plane of immanence, but in reproducing unconsciously the shades of one's ancestors by simply becoming their bodily double. Every singular mode of existence owes his or her life in the first place to the fact that one entity has started to repeat another – and this not by will or reflection,

but via the performance of what Deleuze has called, in accordance with Husserl, a passive synthesis, a way of acting that is performed IN DEED in a pre-reflective, unconscious manner before one is even aware of what one is actually doing as one is performing it, this act, this IT.

Repeating others in such a mode is precisely how acting the drama of *a* life begins. Since I never existed before this act, but am rather produced by and through its performance, it, this particular IT that has created me at the very onset of my life is perforce the transcendental field of a pre-individual essence. It is an unconscious activity that has started to create me rather than I having created IT. Even when one condemns this mode of repetition later on, after one has started to exist, the fact that one derives from it is not annihilated or stopped by simply deciding not to repeat it, this IT, anymore in the future.

'At best', Nietzsche continues,

> we bring the matter to a conflict between our inherited customary nature and our knowledge. [. . .] We cultivate a new habit, a new instinct, a second nature, so that the first nature atrophies. It is an attempt to give oneself, as it were, a past *a posteriori*, out of which we *may* be descended in opposition to the one from which we *are* descended. (Nietzsche 1999a: 270)

Perhaps, Nietzsche writes, one begins to repeat one's ancestors differently in one's own life by cultivating new habits and different instincts, in short, by cultivating a second nature arising from the performance of deconstructing one's inherited past. Culture, in these terms, is a word that indicates nothing less than the gap between two forms of nature: a first and a second one, divided and fractured in two parts by the occurrence of a powerful resistance, resisting the simple reproduction of a past tense, so that the repetition of one's IT gets out of joint and thereby becomes agonistic in itself. This fractured self longs for 'me' to be recovered by transforming it, this wounded IT, by transforming IT into a more promising one, a more promising future.

In the very beginning of a life, that life usually does not stay in contact with itself in an exuberant way. One is rather used to live one's life as if one were not alive at all. Being just the medium of one's ancestors, one's life simply mimes one's heritage over and over again. In such a 'bad' form of dramatising one's life, one lives as those who taught one how to live. Zarathustra regards the animalistic existence of his animals 'as barrel organs and buffoons', taking place even where one should finally let go of the same old fables in order to regenerate them anew. It is not a question of relapse but rather one of regeneration, a call to perform the

third synthesis of time, that temporality in which one is actually on the way to recover from a poisonous cultural beating, ready to counter-sign life again, once and for all, over and over again. *Amor fati*.

I. Caesura – The Time of a Drama

In Deleuze, as well as in Nietzsche, culture does not at all start with a social contract but, with the event of a traumatic caesura, a global hit, responsible for the shattering of our IT. Deleuze says,

> The caesura … must be determined in the image of a unique and tremendous event, an act which is adequate to time as a whole. […] Such a symbol adequate to the totality of a time [that causes an entire world to pass away], may be expressed in many ways: to throw time out of joint, to make the sun explode, to throw oneself into the volcano, to kill God or the father. (Deleuze 1994: 89)

Clearly this is a dramatic situation, in which the unfolding of time itself reaches a point where it longs for an epochal change: a nadir or zero point (*Nullpunkt*) in time in which the image of the totality of time is 'torn into two unequal parts' (Deleuze 1994: 89). The first part signifies the totality of time that passes away and the second one, announced already by the taking place of a caesura, makes the simple reproduction of the world, as it passes away, impossible in the future. 'In effect', Deleuze writes,

> there is always a time at which the imagined act is supposed 'too big for me'. This defines *a priori* the past or the before […]. The second time, which relates to the caesura itself, is thus the present of metamorphosis, a becoming-equal to the act and a doubling of the self, and the projection of an ideal self in the image of the act […]. (Deleuze 1994: 89)

The temporality of a drama is precisely that becoming in which a singular mode of existence is forced to counter-sign its life by rejecting the simple reproduction of an offered past. That past simply does not appear promising anymore for the subject called to accept it that is to mime and fulfil it as the bodily agent of its survival. In such a case the promise, promised by one's ancestors, indeed fails, because the passive affections, transferences of joyful sentiments, in fact no longer come about. One is no longer kissed by the kiss of the muses, the messengers of joy, so that the demand to stay within a given promise has lost its promise. It is this lack of joy, the impotence of the given promise to stimulate us anymore, that actually enforces our power to refuse it, even

though we are not yet sure what this resistance and caesura will bring to us. In this sense, history is theatre: 'the action of historical actors or agents becomes a spontaneous repetition of an old role. ... It is the revolutionary crisis, the compelled striving for something entirely new' (Rosenberg in Deleuze 1994: 91).

The becoming equal to the entirely new that is announcing itself in the event of a caesura longs for modes of existence able and ready to affirm the global challenge of a worldwide change, even if such fractured modes know that such a task is too big for them. Yet historical agents are often not capable of doing what they have already been called to do: to counter-sign their fate to overcome their first nature in order to transform it into a second, more stimulating one. 'O Zarathustra, your fruit is ripe, but you are not ripe for your fruit. Thus you must return to your solitude again' (Nietzsche 1995: 147).

The drama of Zarathustra precisely bridges two striking events. The first is the bitter, poisonous moment in which the monster of nihilism has crawled into Zarathustra's throat. The second is the moment of his recovery, in which he becomes capable himself of affirming his own, most abysmal thought: the doctrine of the eternal return of the same. Here is a new and paradoxical promise, one able to render him the means to defeat the doctrine of European nihilism that he, Zarathustra himself, has inhaled in his youth.

To become equal to his fate to be the teacher of the eternal return of the same, Zarathustra first has to conquer the inability of his own soul to desire its own return eternally, once and for all. In the beginning of the drama of his life he himself revolted against the doctrine of his most abysmal thought, which initially came to him as a daemon or monster rather than as a stimulating promise. At this time his soul still resembled more the conceptual persona of the truth-seeker whom he had met in his youth and heard once say: 'All is empty, all is the same, all has been!' (Nietzsche 1995: 133). Hearing this doctrine, Zarathustra himself was overwhelmed with an enormous sadness and exhaustion, as was the crowd who had gathered around the augur and heard him speak of life in such a manner. 'The best grew weary of their works' (Nietzsche 1995: 133). This speech of the soothsayer had something infectious in it. No one could effectively deny the illocutionary force of its words. Even Zarathustra himself was so infected by the speech that he 'walked about sad and weary; and thereby became like those of whom the soothsayer had spoken (Nietzsche 1995: 134).

Although Zarathustra had meanwhile learned that the words of the augur were merely fable-songs, the self-fulfilling prophecy had at the

time become word and remained stuck in his throat. This prevented him still from taking the all-decisive step, which would have cut the head off his disgust with life and freed him from his melancholy.

Even if he was not yet capable of completely digesting the bite of the poisonous words which had subdued him at the time, at least Zarathustra wanted to prevent his own friends and followers from being infected by the poisonous saying. 'I led you away from these fables', Zarathustra continued: when I taught you 'the will is a creator'. All 'it was' is a fragment, a riddle, a dreadful accident – until the creative will says to it 'But thus I willed it'. Until the creative will says to it 'But thus I will it; thus shall I will it' (Nietzsche 1995: 141).

II. Remembering the Empty Form of Time – Amor Fati

In reference to Deleuze's text *Difference and Repetition* (1994), Giorgio Agamben rightly reminds us that a 'lively' interaction with the transferred heritage of a certain history is therefore not just about remembering the past in order to prevent it from being forgotten. Rather, the potentiality of an act of remembrance lies in an act of regenerative re-membering, which, during the process of recollection, is posthumously returning a future to a past and thereby gives unfulfilled possibility back to a past. Such a creative, artistic remembering 'restores possibility to a past, making what happened incomplete and completing what never was. Remembrance is neither what happened nor what did not happen but, rather, their potentialization, their becoming possible once again' (Agamben 1999: 267).

A history in the service of life – a *topos* that Nietzsche early on affirmed (Nietzsche 1999a: 243–334) – will therefore not be satisfied with having dealt with the transmission of a historical heritage only in historical-critical perspective. Rather it will be about a 'plastic' interaction with history, in which our transmissions are treated primarily as the material of synthetic-performative processes. It will not just be about stating and staging that which was, in performing its historical replay over and over again, but about the performative interaction with that which has been transmitted to us as 'a fragment, a riddle, a dreadful accident' (Nietzsche 1995: 141), as Zarathustra says, in order to deal with it in multiple fragmentary ways. Zarathustra has to become ripe to experience this stimulating yet paradoxical message inherent in his most abysmal thought. In addition, if Zarathustra wants to do justice to his fate IN DEED and present a polyphonic expression of his teachings on the eternal recurrence of the same, then he needs to acquire a new and

sensitive lyre which will allow him to transmit the nuances and the abyss of his teachings to those who have an ear for such unheard-of truths. 'Sing and overflow, O Zarathustra', his animals advised him on his way to recovery, 'cure your soul with new songs that you may bear your great destiny, which has never yet been any man's destiny. For your animals know well, O Zarathustra, who you are and must become: behold, *you are the teacher of the eternal recurrence*. That is your destiny!' (Nietzsche 1995: 220).

Not yet ripe to affirm his doctrine as a third kind of knowledge in Spinoza's terms, a knowledge that elates per se, Zarathustra first has to undergo the temporality of a metamorphosis in which he himself will become adequate to this destiny. The temporality in which he will become who he is, is precisely the drama of his convalescence: the time of his acting in the drama that is his life. A life, as an act of regeneration of those handed-down forms of life, means therefore more than just being generated, more than simply to be alive. It means to perform our lives as a form of *Ueberleben*, a form of 'sur-viving' while we are actually alive. This performative turn within a life is exactly the unstable, revolutionary, a priori moment at work IN a life. Every inherited habit, every schema, every type of action now becomes a 'dis-position', a form that can be simultaneously deconstructed and regenerated anew.

Deleuze calls this stage the third synthesis of time: the critical time in the drama of a life in which a hero or heroine in revolt has to become capable of matching his or her own destiny. In this dramatic stage of a life, one literally has to prepare to counter-sign and endorse one's fate, to embrace the caesura in the double affirmation of a singular *amor fati*, and confirm that affirmation IN DEED once and for all.

Zarathustra's recovery obviously was not just about repairing the functionality of the already existing strings and chambers of his disposition in order to cure his chronic malaise of being infected by the destructive force of Christianity as he experienced it on its dead-end road towards what he identified as European nihilism. The drama of his recovery was not just about repairing old strings and rotten instruments, but about the regeneration of his entire sensual sensorium. We are talking about the entire repertoire of his senses to which he can momentarily refer, and thus the whole way in which his feelings of being touched, inspired and moved by the world are perceived, pre-reflectively understood through passive synthesis and finally interpreted pre-ontologically. All this is at stake in the process of his recovery. The feelings that are still created by mechanical recourse to the existing

chambers of his disposition have to be reconsidered anew, they have to be checked for the temper of their constitution, sensitively reviewed, and if necessary synthetically expanded, emotionally transformed, supplemented, completed and therefore constitutively reworked. For this reason a regenerative act is not just a recursive act by means of which one can simply refer, retentionally, to already existing chambers of one's disposition in order to use them for the umpteenth time. For if this happened, then this would just be a mechanical performance of feeling, nothing more than the production of a *cliché* of emotion in which we habitually react to sensory impulses with this or that affective pattern. The contemporaneousness of the current situation would then not be taken into consideration; it would not be felt and experienced.

Deleuze calls it

> struggling on the one hand against Habitus, on the other against Mnemosyne; [. . .] refusing the overly simple cycles, the one followed by a habitual present (customary cycle) as much as the one described by a pure past (memorial or immemorial cycle). (Deleuze 1994: 94)

Not just this or that organ, to which Zarathustra up until now has had recourse, but the way he 'uses' his entire sensitive sensorium is therefore at risk during the course of his convalescence. Interrupting the habitual habitus of his soul, so that the execution of emotional acts is examined during their execution and perhaps thereby ennobled and renewed: that is the recipe which not only Gilles Deleuze but also Zarathustra recommends in order to regenerate their emotional existence. Throughout the new instrumentation of his soul, Zarathustra thus was not only concerned with the composition of new songs and the creation of a new lyre, but he was also forced to immunise himself against all those who are used to translate every new song immediately into the same old recurring melody.

III. On Well-known Melodies and New Songs

As Zarathustra says on the way to his own dramatic convalescence, in order to do justice to the lives of others who were medially transferred to him in the act of his birth and therefore became his fate for his own way of life, he first and foremost needs new songs. The old songs have become too démodé to reach him any longer. 'Do not speak on!' his animals answered him again, 'rather even, O convalescent, fashion yourself a lyre first, a new lyre! For behold, Zarathustra, new lyres are needed for your new songs' (Nietzsche 1995: 220).

Therefore it comes as no surprise that Zarathustra's animals also speak of his teaching in a tone of voice that gives it the ring of a well-known melody: There will be a great year of becoming, they say, a monster of a great year, which just like a sand clock always has to be turned upside down again, so that it may run down and run out again, and all the years are alike in what is greatest as in what is smallest (Nietzsche 1995: 220). Fate catches up with every creature, and after a long cosmic minute it will be reawakened to life and the external circumstances will be repeated, so that it has to live the same life again that it has already led many times, and will live again in the future (Nietzsche 1995: 217–18).

This is how Zarathustra's animals spoke to him on that morning, making a pretence of having spoken of him and his most abysmal thoughts. 'O you buffoons and barrel organs!' Zarathustra replied and smiled again. 'How well you know what had to be fulfilled in seven days, and how that monster crawled down my throat and suffocated me. But I bit off its head and spewed it out. And you, have you already made a hurdy-gurdy song of this? But now I lie here, still weary of this biting and spewing, still sick from my own redemption. *And you watched all this*?' (Nietzsche 1995: 218).

While Zarathustra freed himself with a resolute bite from the historic burden of his own 'it was' – that beast, about whom he said that it smothered him with a great weariness – his animals merely watched this dramatic display, almost as if they did not have any historic burden that strangled them. Almost as if the notion of the 'eternal recurrence of the same' did not burden or bother them at all in their own animalistic existence. Almost as if they, his animals, could tolerate this idea without being ashamed of the eternal return of their own animalistic existence. Nothing in his teachings seemed to be painful for them. On the contrary, they make us believe that some of his teachings correspond to their own animalistic nature, which does not seem to know any resentful misgivings about their own lives.

For the majority of human beings, however, Zarathustra's teachings appear to be hard to digest. This is the sore spot that marks the decisive difference between the animalistic and the human interpretation of his teachings. For while animals have a right to interpret the eternal return of the same as a cosmic event in which their own life is fatefully entangled and fatally embedded, for human destinies it is proper to interpret the same event as the chance of a concrete challenge that all human beings need to face, give their own signature to, and hence have to engage in as long as they are alive. Zarathustra's phrase 'the eternal

recurrence of the same' is for humans never just a fatal truth, but rather a type of guiding principle (*Leitsatz*), which humans should not simply believe or treat as a given fact, but should cope with as something that has to be reciprocated in practice, that is to say, considered bad or good, cursed or agreed upon, wanted or refused. Only after a person has already chosen to make Zarathustra's concept of 'the eternal recurrence of the same' the maxim (*Leitsatz*) of his or her own life is such a person enforced to internalise it as the governing principle guiding his or her soul. The sensitive application of the teaching of 'the eternal recurrence of the same' to an individual existence, as an act of maximisation and intensification of one's liveliness, is a re-creation of pre-existing dispositions in a living creature and clearly not just an act with a purely descriptive character. Rather it is a performative-synthetic act in which the contemporary dispositions of a soul are not just cited, but expanded, supplemented, re-created and creatively regenerated during the performance of such an act.

Thus too the dispositions that Zarathustra confronts during the internalisation of the concept of 'the eternal recurrence of the same' – whether they concern his ability to feel, to think, to behave or to desire – all these abilities cannot be merely used, cited and applied in their existing form. Rather, during the process of the internalisation of his teaching, they must be exceeded, reworked, and, if necessary, synthetically expanded and constitutionally reconstituted. In a passage that is given the title 'On Redemption', Zarathustra can say this about the act of redemption: 'To redeem those who lived in the past and to recreate all "it was" into a "thus I willed it" – that alone should I call redemption' (Nietzsche 1995: 139).

IV. On Redemption

To repeat what has been transmitted to us as a life – what we ourselves hence did not bring forth and yet are forced to be – to repeat this in such a way that we come to the point of affirming it by willing it: that alone would mean redemption for Zarathustra, since the burdensome character of the past that is thereby repeated would completely disappear and melt away in such a moment of *amor fati*. Once we do understand that Zarathustra, from the very beginning of his own recovery, started to cut and refine the genealogically transferred historical burden of his life in such a way that his 'first nature' became ennobled and purified and was made into a jewel by his life, then it is clear that Zarathustra's notion of *amor fati* has nothing to do with a passive form of love. Since

his reception of the life that has been transmitted to him, Zarathustra's fulfilment of his own *amor fati* represents a synthetic act a priori, which Zarathustra has to perform and execute himself existentially in the course of his own genealogical becoming. Thus every living act, structurally speaking, represents a synthetic act a priori because the execution of a 'lively' behaviour necessarily brings with it a moment of instability: the possibility of an event that leads to the restructuring of those very structures that were involved in the act from its inception.

V. The Dawn

Today, at the dawn of his convalescence, Zarathustra was finally prepared to bring the ill-tempered nature of his soul to a sudden end and to rid himself of the monster of nihilism that had overcome him. 'It is I or you!' (Nietzsche 1995: 157) he cried out against his own melancholy. This morning Zarathustra sprang up from his bed and screamed with a dreadful voice: 'Up, abysmal thought, out of my depths! I am your morning cock, your dawn, you sleepyhead. Up! Up! My voice shall yet crow you awake!' (Nietzsche 1995: 215). Now IT was time; now he was ready for the decisive, final act.

On this morning, a resolute Zarathustra began to plumb his soul's abysses in order to hear what they had to say about his most profound thoughts. Once Zarathustra had seen a young shepherd lying on the ground, doubled over in pain because a heavy black snake had crawled into his mouth. Now, this morning, something in him cried out as well: 'Bite! Bite its head off! Bite!' (Nietzsche 1995: 159). Not just any day had begun this morning, but rather that day over which was written 'the convalescent', a date which would mark the singular nadir in the life of Zarathustra. If Zarathustra wanted to recover by virtue of his own thoughts, a morning would have to come to him on which he should be prepared not just to teach others his own teachings, but also to perform them on and by himself, an act of biting, in order to free himself from the burden of his own legacy. And look, today the day has come, the day on which he will challenge his own abysses to divulge something of his most abysmal thoughts. The final act in the drama of his convalescence should take place this morning and thus become a real event. 'You are stirring, stretching, wheezing? Up! Up! You shall not wheeze but speak to me. [. . .] I summon you, my most abysmal thought!' (Nietzsche 1995: 215–16).

During the dawn of his convalescence Zarathustra dares his own anima to speak of his most abysmal thoughts. All of the life that was

in him should today speak *to* him. His most abysmal thoughts should today testify to his soul. From them he finally wants to know what they themselves have to say about his teachings. This morning it had finally come to the point where they had to show their true colours and testify to what touches them in the deepest depth. It is no longer Zarathustra who speaks to his soul in the dawn of his convalescence. Rather it is his soul that speaks to him today. 'Hail to me! You are coming, I hear you. My abyss speaks, I have turned my ultimate depth inside out into the light. Hail to me! Come here! Give me your hand!' (Nietzsche 1995: 216).

Now the doctrine, demand or law of the eternal return of a regenerating mode of repetition has finally become a stimulating one, one that does not stimulate merely our intellect as a social demand or duty but a stimulating promise that corresponds to Stendhal's definition of beauty as the taking place of an unanticipated promise of luck, '*une promesse de bonheur*' (Nietzsche 1999b: 347). For the first time Zarathustra's teachings are reciprocated from the depths of his own soul. For the first time his soul echoes him. No longer does his soul fear its own abysmal thoughts. On the contrary, today even its abysses speak to him of his abysmal thoughts.

Have his teachings in the meanwhile really reached the deepest strings of his soul? Have they in the meantime really reached these depths and been desirously received in the deepest chambers of his anima? Shaken by the event that his soul reciprocated his own teachings, Zarathustra first remained lying, pale and stricken. Seven days he needed in order to digest that which he experienced during the final act of his convalescence. 'At last, after seven days, Zarathustra raised himself on his resting place, took a rose apple into his hand, smelled it, and found its fragrance lovely' (Nietzsche 1995: 216).

VI. *Amor Fati* as an Elating Double Affirmation (Counter-Signature)

'Nietzsche's *Zarathustra* is clearly a drama, a theatrical work', writes Deleuze, summarising his theory on the drama of repetition-in-itself. 'The largest part of the book is taken up with the before, in the mode of a defect or of the past: this act is too big for me' (Deleuze 1994: 92). The preparatory prelude of Zarathustra's story culminates, according to Deleuze, in the transition from the second to the third part of the drama. In 'The Stillest Hour', the last section of part two, we are told

that Zarathustra must again return to his solitude, precisely because 'his fruit is ripe, but he is not ripe for his fruit' (Nietzsche 1995: 147).

But Deleuze goes on to say, 'Then comes the moment of the caesura or the metamorphosis, the Sign, when Zarathustra becomes capable'. Only a little later, in the second section of the third part, 'On the Vision and the Riddle', Zarathustra's metamorphosis begins because he starts IN DEED to challenge his first nature. 'Stop, dwarf!' he says. 'It is I or you!' (Nietzsche 1995: 157).

The only way to free himself from his past had appeared to him in the vision and the riddle of a young shepherd 'writhing, gagging, in spasms, his face distorted, and a heavy black snake hung out of his mouth' (Nietzsche 1995: 159). Zarathustra would have to detoxify himself from the poisonous grip of the heavy black snake of European nihilism, a monster similar to the one that had crawled down the throat of the young shepherd while he was asleep. Now the alchemic contest between 'the spirit of gravity' (Nietzsche 1995: 158) and the performance of accessing his most abysmal thought, the thought of the eternal recurrence of the same, longs for a conclusive and decisive act. Zarathustra bites. The cut takes place.

However, 'The third moment remains absent: this is the moment of the revelation and affirmation of eternal return' (Deleuze 1994: 92). Deleuze assumes that Nietzsche did not have enough time to formulate dramatically this third stage in doing philosophy. Of course, the time after Zarathustra's recovery, the smell of the rose apple and its lovely fragrance, is on the far side with respect to Nietzsche's enterprise. But it is by no means out of bounds. It rather expresses his will of doing philosophy from a perspective located wholly within the scope and purview of *The Use and Abuse of History for LIFE*. 'In this sense', one can agree with Deleuze,

> something completely new begins with Kierkegaard and Nietzsche. They no longer reflect on the theatre in the Hegelian manner. Neither do they set up a philosophical theatre. They invent an incredible equivalent of theatre within philosophy, thereby founding simultaneously this theatre of the future and a new philosophy. (Deleuze 1994: 8)

Sense, Being and the Revelatory Event: Deleuze and Metamorphosis

Peter Hertz-Ohmes State University of New York, Oswego

Abstract

Metamorphosis is a sudden change, a 'becoming-other' in life or in philosophical perspective. A revelatory event initiates in a double manner the move from Heidegger's futile search for a transcendental IT that delivers perceptible beings to the confident positing of Deleuze's transcendental empiricism, suffused with the IF of incorporeal sense. In the process Deleuze dramatically enacts his personal connection between sense (*Sinn*) and being (*Sein*).

Keywords: event, being, incorporeal sense, transcendental empiricism, becoming-other, Deleuze

When working with philosophers who live philosophy rather than consider it an academic exercise, key words that they use can be traps that prevent rather than facilitate understanding. This is especially a problem when two or more languages are involved: French, German and English or Greek and Hebrew, not to mention Japanese and English.[1] To grasp the problem, it can be useful trying to translate a major philosopher such as Heidegger, with all of his etymological baggage, or Nietzsche, with his idiosyncratic, aphoristic and purposely counter-philosophical vocabulary. With respect to French philosopher Gilles Deleuze, who draws heavily on both Heidegger and Nietzsche, the traps multiply because he also lays them deliberately and subversively in order to mislead academic explication and thus to force the kind of confrontation with conceptual dead ends that has the power to lead to 'enlightenment'.

Take for example Deleuze's use of '*événement*'. This term translates easily into English 'event', a relatively innocuous, even weightless word. In German however, 'evenement' becomes 'Ereignis', which, thanks to Heidegger and a long philosophical tradition, carries the whole weight of

Being on its shoulders. Both translations are clearly traps. What Deleuze calls 'evenement' is decidedly neither 'event' nor 'Ereignis'. For Deleuze 'evenement' is dramatically transformative, signalling a metamorphosis not just in thinking but also in life as lived.

Let's begin by asserting that even in English events can be fundamental happenings, that an event is a process or eventuation or becoming, what Deleuze calls an actualisation or Heidegger calls a 'coming into one's own' or coming into a way of existential being (*seiend*). We live after all in a world of givens, including ourselves, and in light of our finite powers of thought, there are always ultimate questions about how all our givens were given in the first place. So then the age-old philosophical question naturally arises, as Heidegger would say, 'What in the last analysis is IT that gives?' (Heidegger 1972: 16).[2] While for a finitist philosopher that may be a question beyond answer, there certainly has been no lack of trying. And IT has never prevented one from giving Heidegger's unknowable transcendent powers various names, like God or ideals, reason or noumena, and so on, causing philosophy endless trouble, not the least of which is competing with self-validating religious doctrines.

For while all attempts to storm the transcendental realm philosophically seem bound to fail – by definition, so to speak – there have been no end of privileged communications *from* the transcendental into our world of reality. The word for such communication is 'revelation'. Revelations constitute major turning points or, literally, *cata-strophes* in the life of an individual or group. They radically change who we are, give us a new identity, put us with newly gained conviction in the middle of an ongoing dramatic action, and allow us to proceed in life with a certainty we never had before. Harold Rosenberg, in the *Tradition of the New* – a book highly praised by Deleuze (1994a: 91–6) – calls attention to the tripartite dramatic structure of character change, using Hamlet as his prime example. He echoes thereby Paul Tillich's tripartite structure of religious revelation, which also involves the probing, unsettling uncertainty of an outsider looking in, a near-death ecstasy, and consequent committed action in the midst of what Tillich calls an 'ultimate concern'.[3] There is then in this respect a

> fundamental connection between religious and dramatic thought. In both, the actor does not obey his own will but rather the rules of the situation in which he finds himself. In both, change (and escape from the plot) can be accomplished through one means alone, the dissolution of identity and the reappearance of the individual in a 'reborn' state. (Rosenberg 1971: 152–3)

Or, as Gilles Deleuze would say, it is a question of 'becoming other'.

Revelations take place in many areas of human endeavour, in religion and literary drama, to be sure, but also in revolutionary politics (Lenin), radical art (Bacon), Freudian psychology, the sciences – Archimedes' 'Eureka!' is a prime example – and even in mathematics, where Pythagoras and the revelation of the dreaded irrational numbers comes to mind. Thomas Kuhn calls such events 'paradigm shifts', which are certainly not without their dramatic moments.

So what about philosophy? What part can revelation play in the very field that regards revelation as nothing more than a crisis of thought and condones transcendental or inaccessible sources only as a last resort, when all else fails to glue a system together? Empiricists are particularly unhappy with the transcendental, yet in the last analysis the empiricists' starting points, simple perceptions, have to come from somewhere too, no matter how successfully one disparages so-called universal truths as products of habit.

A few philosophers actually admit to a revelatory aspect in philosophy, as in Nietzsche's famous revelation of the 'eternal return' or Schelling's systematic treatment of revelation. But other philosophers take pains to deny that revelation has *philosophical* relevance. Nietzsche stands accused of having hallucinations, and Kierkegaard faults Schelling for misunderstanding the singular and personal aspect that makes revelation so special. Plato's famous solution was to wrap the problem of revelatory communication in myth!

So what about Gilles Deleuze? He should know something about revelation because early in his career he too went through a trans-mutational experience, a veritable philosophical metamorphosis.[4] After the publication of his first book on Hume (Deleuze 1991/1953), Deleuze endured eight years of silence, what he himself calls 'a hole' in his life before emerging again with a spate of major books and a new philosophical buzzword: transcendental empiricism (Deleuze 1997: 138). 'This eight year hole in Deleuze's intellectual life does in fact represent [...] a period of *dramatic* reorientation in his philosophical approach', says Michael Hardt (1993: xx). The movement from ordinary or classical empiricism to virtual-transcendental empiricism was for him an extraordinarily difficult crisis of reconceptualisation, profoundly influenced by Nietzsche's own crisis. The result thereafter: the astonishing consistency of Deleuze's thought, even if that is difficult to see under the breadth and complexity of his works.

But how are we to understand this 'other' Deleuze with his 'other' philosophy? What in the world is 'transcendental' empiricism? Isn't that a contradiction in terms, a non sequitur or even a joke? If it is

a joke, that may sound hopeless but it is not serious. If it is a joke, it is in line with René Thom's catastrophe theory. Catastrophe theory was all the rage a few years ago, before chaos theory took centre stage, and culminated in a book by John Paulos called *Mathematics and Humor*.[5] But as Paulos knows, Thom's catastrophe singularities are not necessarily mathematical singularities at all but can be philosophical breaks or jumps between two ways of thinking, in this case between empiricism and transcendentalism.

If Deleuze is cast as an empiricist, his difficulty is clear: he is an outsider with respect to transcendental philosophy and cannot satisfactorily attack its presuppositions. This is Hamlet's problem as well, and why Hamlet dithers and cannot kill the king in the first part of his play. Deleuze's identity as an empiricist must undergo a radical transmutation if he is to re-emerge in the royal realm of transcendentalism and legitimately kill its assumptions. Somehow his empiricism must take on a virtual aspect it has heretofore avoided.

But how can Deleuze manage that? His new confidence, his new philosophical persona, can only be grounded if he can make sense of his new position. Make sense of his new position? No. Not make sense OF the new position, but make sense THE new position. In other words, Deleuze decides to insert SENSE in the catastrophic break or jump between empiricism and transcendentalism as a new kind of link between the actual or empirical and the virtual or 'transcendental'. The point is basically as follows: Deleuze re-prioritises thought by moving from being to sense, that is (in German) from SEIN to SINN.

Yes, transcendental empiricism is a kind of joke, but the joke is on the transcendentalists. We began by saying that the transcendental is a source from which emanate the laws and models, the forms and ideals, the originals and paradigms on which we base our accidental and imperfect real world. Its Being is unassailable from this side, that is to say, from the world of beings. But it communicates in privileged and personal communications with the world through those we call priests and rulers, prophets and principals. If like Kant we discount the personages who claim a connection to the transcendental, there are still the intuitions of reason or harmony or common sense to consider. Must we take these intuitions on faith? Or was Kant trapped by a search for integrative sources, just as certainly as Hume was trapped by a 'pointilism' that simply could not coalesce to form the kind of actual worlds we all experience.[6] As paradoxical as it may seem, it is precisely Deleuze's ingenious concept of sense that supplies the

conceptual glue Kantians and empiricists have both failed to produce. And this is the subject of the intentionally paradox-ridden Deleuzian *Logic of Sense*.

How then can we characterise sense? In a way, Deleuze's sense is nothing at all, at least insofar as it is incorporeal and cannot be touched or felt as such. But if eventuation is a giving, the giving of perceptions, then, says Deleuze, the resulting extensive environment must necessarily be charged with a correlative given, a correlative sense. Incorporeal sense lies like a transparent skin on everything that is in the world, including and particularly the corporeal linguistic units, written or oral, whose various possible senses it implies. Philosophically speaking, sense can be considered the tissue of concepts that holds any particular culture together, whether yours or mine or the possible worlds of any social group we can imagine. This tissue is entirely this-worldly, not transcendental.

On the one hand, sense is neither inherently virtual nor transcendental, any more than are the more or less flexible concepts that make up sense. All this is truly real. But on the other hand, because it is incorporeal, sense is not imbedded in or directly attached to the physical or material world, including actualised time and space. It is truly 'entre temps' or 'meanwhile' with respect to the succession of time, and as such, unlike chronological time, sense is in a special way 'recurrent' or superimposed upon itself (Deleuze and Guattari 1994b: 158). It thus bears some interesting resemblances, as we are beginning to see, to what Nietzsche calls the eternal return of the same or what Klossowski calls the vicious circle.

The job of philosophy, as Deleuze understands it, is to create and/or dismantle concepts. Concepts make explicit implicitly held beliefs that are fundamental to a society. Concepts are generated geopolitically and self-referentially out of their own constituent parts, without the need of controlling emanations from a transcendental source. They are, as Deleuze says, 'real without being actual, ideal without being abstract' (Deleuze and Guattari 1994b: 22). And, I repeat, constructing concepts is what a philosopher does, with perhaps a crisis of thought, but not with the help of otherworldly sources. Thus philosophy, by showing how concepts are constructed, has the means to eliminate classical realms of emanation.

Nevertheless, incorporeal sense would be completely vacuous if there were no actualised worlds to cover. And no doubt we are all within a world that is both constant and changing all around us. So the question becomes, how can empiricism account for the being of the sensible? Or

to phrase the problem succinctly, why is there something rather than nothing?

It is here that conceptual sense reflexively re-introduces the virtual, but not as an attribute of an inaccessible superior Being. As conceived by conceptual sense, the virtual is comprised of collections of yet undefined and indefinite energies that, unlike the concept itself, have under the right circumstances the potential of corporeal, perceptual actualisation. And where are all these undefined and indefinite energies? All around us, in and among us, that is to say they are immanent. Taken all together they constitute a plane of immanence. Taken as fortuitous singularities, each singularity is a differential 'will to power' – Nietzsche again – a differential 'will to power' ready to differenciate itself – differenCiate with a 'c' – through actualisation in the so-called real world (Rölli 2009: 36).

The syntagmatic differenCiation of the differential means setting aside (although not losing) inherent difference through necessary conforming, as a perception, to the already present habitual conditions of, for example, subject/object, space/time and linguistic configurations, as well as of phenomenological consciousness in our case as humans. As pre-actualised differentials, the virtual plane of immanence can be considered transcendental, but this is a 'transcendental' that is as fully accessible in its workings as those of Mallarmé's post-metaphysical, aionic 'Throw of the Dice'. I quote: 'anxious, expiatory and pubescent … mute … laughter … that … IF (Mallarmé 1994: 138)'.[7] There's that IF that says we're on our own! Always the same repetitive throw (Heidegger's IT), always the subtle differences (Mallarmé's IF) in its sense. Repetition and difference, *Difference and Repetition*: isn't that the true EVENT!

Yes, event. If the throw of the dice is Heidegger's *Ereignis*, then its IF is the Deleuzian event. And that IF is the tissue of sense, the incorporeal counterpart to the three passive syntheses of time: past experience, present instant and future indetermination. But being incorporeal means also that sense-as-event swirls around and through time, space and perceptions as a constantly counter-actualising force. We might say that Deleuze's Nietzsche – or Mallarmé – oriented IF lights up Heidegger's onto-theological IT. To put it another way, the Being of the sensible depends on the sense of that Being. *There is no Ereignis without the splendour of the Event*.[8]

It is appropriate to sum up in a special way. If one were to fictionalise the life of Gilles Deleuze as the great destroyer of the transcendent monster's 'emanating' domain, one would make him first the author of a Proustian novel.[9] Then, for the end of his life – which unfortunately gets all too little attention – it would be necessary to cast him in a

Greek-like tragedy very much like the anachronistic play *Empedokles* by the eighteenth-century German genius Hölderlin. Here's how the whole Deleuzian story would play out from this perspective.

As our young fictional Deleuze looks at the history of philosophy to the present day and realises that he is losing – no, wasting – time, he almost gives up his dream of becoming a philosopher. But then, having regained in a transmutational crisis the secret weapon called sense that hasn't been used since the Stoics, our fictional Deleuze morphs into a heroic knight, turns the transcendental dragon into Puff by writing a series of timely tomes, and is increasingly cheered by his disciples as the new philosopher king.

But in later years Deleuze comes to understand that without the need for chosen leaders to interpret enigmatic messages from discredited transcendental sources, he must reject the kingship offered him. To quote Hölderlin, 'the time for kings has come and gone … You can't expect *my* help if *you* can't help yourselves' (Hölderlin 1968: II, 1438 and 1452–3, my translation).[10] These words ought to trigger a social revolution. But they imply more. Our fictional Deleuze must recognise, as did the philosopher Empedocles, that by having dismantled the royal mantle of authority, he cannot any longer stay around and argue with his detractors. No, he must once again become 'other'. No longer individual or universal within his social milieu, he must entrust himself to the 'singular splendour of the fourth person', the truly immanent it-that-gives, and re-emerge for us through a final re-generative metamorphosis as the legendary FREE MAN. As his works and his actions show, the free man

> grasps the event and does not allow it to be actualised as such without enacting, the actor, its counter-actualisation. Only the free man can comprehend all violence in a single act of violence, and every mortal event in a single Event. (Deleuze 1990: 152)

We know from Hölderlin that Empedocles convinces his clinging friends to leave him. He then climbs the slopes of the chaotic volcano Etna and abruptly jumps into its molten interior. So – in his own way – does Deleuze.[11] The revelatory sense of that event should continue to inspire Deleuzians both now and long hereafter.

Notes

1. For relevant discussions of translation problems, see the author's first translation of Heidegger's *On the Way to Language* in his Stanford dissertation (Hertz 1967), then compare it to the version that was revised to conform to other

Heidegger translations at the time, published in 1971 and still in print. For Greek and Hebrew see Boman (1960), and for Japanese and English see Nishitani (1982).

2. 'We are still faced with the enigmatic IT that we named in the expression: it gives time, it gives being (*es gibt Zeit, es gibt Sein*). ... When we speak of IT, we arbitrarily posit an indeterminate power that is supposed to bring about all giving of being and of time. ... IT eventuates (*ES ereignet*). ... Being is appropriated in the eventuation (*Sein verschwindet im Ereignis*). What remains to be said? The appropriating eventuation eventuates appropriately (*Das Ereignis ereignet*)' (Heidegger 1972: 16–24, revised P. H.).
3. 'Revelation is the manifestation of the mystery of being for the cognitive function of human reason' (Tillich 1951: 129).
4. As Deleuze says again and again regarding metamorphoses in literature (Kafka, Carroll, Proust, Melville, et al.), there is nothing metaphorical about them. They are 'charts of intensities'. See for example Deleuze and Guattari (1975: 65).
5. See Paulos (1980) on the connection between jokes and René Thom's catastrophe theory.
6. For a complete discussion of the traps Kant and Hume fall into, see Rölli (2003). The author of this paper is presently translating and editing the book for publication in English.
7. On Aion as 'an empty and unfolded form of time', on an event-oriented playing of the game, and on Aion again as 'an infused and ramified chance', all in relation to Carroll and Mallarmé, see Deleuze (1990: 58–65).
8. On the splendour of the event, see Deleuze (1990: 152).
9. 'Proust's work is not oriented to the past and the discoveries of memory, but to the future and the progress of an apprenticeship. What is important is that the hero does not know certain things at the start, gradually learns them, and finally receives an ultimate revelation' (Deleuze 2000: 26). (Becoming 'other', becoming writer.)
10. Nietzsche, who venerated Hölderlin, incorporates the same line in *Also Sprach Zarathustra*, part III, 'Von alten und neuen Tafeln' (Nietzsche 1999: v. 4, 263).
11. Taking one last breath into his collapsed lung, he kicks away the machine, and leaps into the mouth of the open window ... 'for dying [...] gives him the right to begin anew...' (Deleuze 1990: 65).

Forum Introduction: Deleuze, Whitehead and Process

Keith Robinson University of South Dakota

At the First International Deleuze Conference held in August 2008 at the University of Cardiff, Wales, each of the three contributors here presented papers in the session on 'Deleuze, Whitehead and Process'.[1] For this *Deleuze Studies* special forum, we were invited to re-address the relation between Deleuze and Whitehead by developing and elaborating our conference papers or, indeed, writing anew. The purpose of the conference session, and now this forum, is to examine some of the resonances and disjunctions, the affinities and contrasts, between their respective systems of thought. That there are strikingly deep and instructive convergences between Deleuze's and Whitehead's thought is now achieving recognition, not only from those who already work seriously with and on Deleuze, but also within the scholarship on Whitehead.[2] Indeed, as James Williams points out in his paper here, problems dealt with in the secondary literature on Deleuze and on Deleuze and Guattari often have parallels, sometimes remarkably close parallels, to those engaged with in the literature on Whitehead. Some of the most important interpretive issues raised within Deleuze studies in the last few years regarding, for example, the relation between the virtual and the actual or the problem of immanence, to name but two, have their counterparts in the Whitehead literature, and these problems are dealt with here in ways that are often directly relevant and illuminating for thinking about Deleuze. When placed in the context of either Whitehead's own thinking or the body of scholarship on his thought, questions pertaining to the meaning, purpose and scope of Deleuze's work, including questions on the nature of his thought and its relation to Western traditions of philosophy, science and aesthetics, are given a novel, surprising and 'untimely' quality.

Scholarship on Deleuze is clearly entering a new phase. The task now is to move beyond the 'introductory' format stage that has hitherto characterised a significant part of 'Deleuze Studies' and attempt to come to terms with the sheer range and daunting complexity of Deleuze's

extraordinary legacy of thought. By bringing Whitehead to bear on Deleuze, this focus section will be a contribution to that task. Each paper engages some of the key concepts that define the Deleuze–Whitehead encounter – immanence and transcendence, creativity and event, process and life – and each paper seeks to raise pressing questions about the role and status of these concepts in both thinkers. The promise of reading Deleuze and Whitehead together is that it will provide not only a new 'image of thought' for each thinker, but also an image of thinking the new in itself alongside a restored belief in the world as ever in the making.

Notes

1. I thank Ian Buchanan and the conference organisers at Cardiff for giving our session 'plenary' status.
2. Recent Whitehead scholarship in French has often referenced Deleuze. See Benoît Timmermans, *Perspective: Leibniz, Whitehead, Deleuze* (Vrin 2006); Didier Debaise, *Un empiricisme spéculatif: lecture de Procès et Réalité de Whitehead* (Vrin 2006); Isabelle Stengers, *Penser avec Whitehead: Une libre au sauvage création de concept* (Seuil 2002). The Whitehead Research Network (http://whiteheadresearch.org/) has actively encouraged readings of Whitehead in the context of Deleuze's work and continental thought more generally.

Immanence and Transcendence as Inseparable Processes: On the Relevance of Arguments from Whitehead to Deleuze Interpretation

James Williams University of Dundee

Abstract

It is argued in this paper that recent work on immanence and transcendence in Whitehead scholarship, notably by Basile and Nobo, provides helpful guidelines and ideas for work on problems regarding immanence in Deleuze's philosophy. By following arguments on theism and naturalism in the reception of Whitehead, it argues that Deleuze's philosophy depends on reciprocal relations between that actual and the virtual such that they cannot be considered as separate without also being incomplete. It is then shown that Deleuze's philosophy allows for metaphysical terms such as 'pure' without having to concede a separate and self-sufficient pure realm.

Keywords: immanence, transcendence, God, relations, naturalism, metaphysics

A discarded magnifying glass lies by the side of a country lane, a mere child's toy, given away free on the cover of a magazine. It captures, or prehends, the sun's rays as they prehend its glass, focusing thereafter on withered, tinder-dry grass, setting it alight. A forest of mature trees is devastated in the subsequent fire, never to return, or at least not plausibly, in the new climate that turned the undergrowth to perfect kindling while conjuring up summer winds of unmatched intensity. Ancient homesteads and chancy new builds suffered equally on the fire front; those that did not or could not flee were choked then calcinated.

It takes a very detached eye indeed to survey this loss and to claim equal value for the new scrub and the ancient settled hills with their natural complexity, animal life and human bonds. 'The world is thus

faced by the paradox that, at least in its higher actualities, it craves for novelty and yet is haunted by terror at the loss of the past, with its familiarities and its loved ones' (Whitehead 1978: 340). This haunting is one of the forces behind the emergence of religion, with its clinging to transcendence as resistance to the passing of all immanent actualities: 'the culminating fact of conscious, rational life refuses to conceive itself as a transient enjoyment, transiently useful' (Whitehead 1978: 340). Harmony, running from past to future through the accord of transcendent entities with passing and novel ones, allows for a dance of transcendence and immanence.[1] Transcendent eternal objects carry forth the valuation of positive prehensions[2] and, as a sum, as one, Whitehead will call them a side of God, his primordial nature:

> In our cosmological constructions we are, therefore, left with the final opposites, joy and sorrow, good and evil, disjunction and conjunction – that is to say, the many in one – flux and permanence, greatness and triviality, freedom and necessity, God and the World. (Whitehead 1978: 341)

Yet Whitehead's model for immanence and transcendence is very subtle and neither realm is full without the other, since each is formed by the other in creative processes.[3] God's consequent nature comes from actual creations, each one creating a new valuation and a new series of relation between eternal objects, but each novel creation comes from a creative pull in God's primordial nature:

> For Whitehead, God is therefore immanent in each occasion by supplying it with its initial subjective aim and instilling in it the desire for perfection as is possible in its immediate situation. On the other hand, as consequent, God is the conscious and unbiased reception of the physical world as it passes into the immediacy of his 'feeling' [. . .] So the mental, permanent side of the universe passes into the physical, transient side by the primordial nature of God, which is his guide for realisation. The *one* becomes *many* by the unity of God's vision passing into the physical world. And the transient, physical side of the universe passes into the mental, permanent side by the consequent nature of God, which is his coordination of achievement. The *many* become *one* by reaching a final completion and harmonisation in God's eternal being. (McHenry 1992: 160)

Thus once Whitehead has set his speculative metaphysical categories in *Process and Reality*, he proceeds to describe and explain a set of 'derivative notions' of which God is one. Derivative should be seen in a strong sense here, as logically derived from the categories, such that God's consequent nature and primordial nature follow from categories for eternal objects and immediate occasions.[4] Here we can see the

folding of one and many into one another, not layered and hierarchical imbrications, such as the ones we shall see Deleuze move beyond a little later (see also Cloots 2009: 69–70), but relations of mutual derivation and dependency where the fold is all and the folded things, mere passing abstractions. One of these folds leads to an entire multiplicity, the many in the one and the one in the many: 'The primordial created fact is the unconditioned conceptual valuation of the entire multiplicity of eternal objects. This is the primordial nature of God' (Whitehead 1978: 31). Yet this entire valuation is itself created, something that draws Whitehead far away from traditional monotheisms:

> One of the major aims of Whitehead's metaphysical endeavour is to provide a rational interpretation of the immanence of God without denying the necessary element of transcendence enabling him to be considered as the principle of concretion and in that sense primordial, whereas the direct consequence of Plotinus' philosophical efforts was to carry the transcendence of God to its utmost extremity in his separation of the spiritual realm from the sensible world, placing him beyond being. (Wilmot 1979: 70)[5]

The consequent nature of God is the way this creativity and 'all-inclusive unfettered' valuation touch the transcendence of a future destiny through concretions of prehensions: 'By reason of its character as a creature, always in concrescence and never in the past, it receives a reaction from the world; this reaction is its consequent nature' (Whitehead 1978: 31). This creative circle moving from abstract eternal realm through a creative transformation in the actual and back to a now transformed virtual realm is akin to Deleuze's circle of destiny and his rejection of fatalism (Deleuze 1990: 149), where Ideas or sense move through surface or intensity to an actual realm, where a counter-actualisation reworks the form and power of the virtual, sending it back to return again as new creativity (Deleuze 1990: 151). It could seem that surface and intensity are the missing terms in Whitehead's account, but feeling can take on this role and intensity has been surveyed as a central component of his account by Judith Jones in this exact context:

> The reference to the fulfillment of God's own being here is unfortunate, for it suggests a divine agency with a directive office somehow transcendent of the creative process in which there is aim at intensity of satisfaction. But Whitehead's God has no such office. God's 'primordial appetitions', whereby there is this aim at intensity are not transcendent of creative process but primordial in it. (Jones 1998: 146)

The Leibnizian term appetition is taken up by Whitehead to describe the work of valuation and hence eternal objects (studied of course by

Deleuze in *The Fold: Leibniz and the Baroque*; Deleuze 1993: 76–82) and God in the drive forward of immediate occasions (see Shaviro 2009: 24–6 and Williams 2009b: 286–7).

Where Deleuze often talks of the desires and compulsions shaping our destiny as genetic members of damned families or alcoholics (Deleuze 1993: 69–70), Whitehead chooses the more universal example of thirst: 'Thirst is an appetite towards a difference – towards something relevant, something largely identical, but something with a definite novelty' (Whitehead 1978: 32). The elegance of his position comes out strongly here, refusing to lapse into notions of pure identity or essence towards which thirst would return us once we have satiated it, and insisting instead on the becoming within the organism and its creative novelty, explicable only through an external source, but one whose full work can only be when transcendence and immanence combine to project things forward: ' "Appetition" is immediate matter of fact including in itself a principle of unrest, involving realization of what is not and may be' (Whitehead 1978: 32). Thus we find transcendence and immanence on two parts of a circle connecting them where neither transcendence, God as the unity of all multiplicities, nor immanence, God as a consequence of specific actual creations, can be treated independently of one another: 'God's immanence in the world in respect to his primordial nature is an urge towards the future based upon an appetite in the present' (Whitehead 1978: 32).

There is an important lesson for speculative metaphysics to take from Whitehead's characterisation of immanence and transcendence.[6] It lies in his positioning of the main philosophical problem away from worries about the mixing of the two terms: 'The vicious separation of the flux from the permanence leads to the concept of an entirely static God, with eminent reality, in relation to an entirely fluent world, with deficient reality' (Whitehead 1978: 346). Flux and becoming must be part of transcendence and immanence; it is a mistake to define one in terms of perfect self-identity and to assign it the role of setting relative identity and being in the other realm. Instead, they are relations we should think of in terms of becoming of different kinds and with different, but complementary, processes. The real problem lies, on the contrary, in their 'vicious separation'. The surprising use of this technical but also physical adjective could be read in many ways, for instance, as a worry about how the two terms are separated, or as concern for the denial of the priority of one or the other term in their separation. Yet what Whitehead means has little to do with how the terms are divided, or with a wish to preserve one or the other of them.

Instead, the separation is vicious because of the results of the separation for both terms. Both suffer violence because they belong together and can only be separated at the cost of creating a false image of each one: 'But if the opposites, static and fluent, have been so explained as separately to characterise diverse actualities, the interplay between the thing that is static and the things which are fluent involves contradiction at every step of its explanation' (Whitehead 1978: 346). For Whitehead, separated transcendence is pure stasis, meaningless because no change whatsoever can take place within it, a timeless and momentum free block. Yet pure immanence is equally nonsensical, since as pure flux we cannot explain its valued forward momentum and novelty, it becomes free of any realities and without sense. This sense is rendered, in *Process and Reality*, in terms of 'immortality' and 'everlastingness' (Whitehead 1978: 347). Again, though, the meaning of these terms is transformed by Whitehead. Immortality occurs through participation in a process of perfection *through* eternal objects and God, but not in them or as them: 'This factor is the temporal world perfected by its reception and reformation [...]' (Whitehead 1978: 347). Once again, this determination of the world as everlasting and completed as such is answered by a mirroring completing of God in the world[7]:

> In this way God is completed by the individual, fluent satisfaction of finite fact, and the temporal occasions are completed by their everlasting union with their transformed selves, purged into conformation with the eternal order which is the final absolute 'wisdom'. (Whitehead 1978: 348)

Nonetheless, and against Whitehead's own critical reaction to brute materialism as a mistaken return to substance metaphysics,[8] there have been persistent attempts to situate his philosophy on one or the other side of the immanence and transcendence divide, as either a philosophy that still culminates in a God consistent with the hierarchical transcendence of Christian monotheism,[9] or as a form of immanent natural realism with no need for any reference to God, eternal objects and hence to transcendence in its strong sense implying different realms (even if these cannot be separated and share the same ontological status in becoming rather than being under the same metaphysical categories). The former interpretation is perhaps understandable given Whitehead's choice of language, even if it is very distant from his arguments and from the logical structure of his metaphysics.[10] The latter interpretation, however, must bracket off Whitehead's work on God in the latter chapters of *Science and the Modern World* (1927), *Adventures of Ideas*

(1948) and *Process and Reality* (1978), in order to emphasise his search for metaphysics consistent with his contemporary sciences.

Following Jorge Nobo's work (Nobo 1986), George Lucas makes the following important points against the conflation of immanence and naturalism in the non-theistic, naturalistic interpretations of Sherburne, Lowe and Ford[11]:

> Such an account of the ground of final causation ultimately reduces Whitehead's category of creativity either to an account of mere randomness or to a mere reiteration of the past. In either case, no non-theistic rationale for the selective dominance in the present of some certain and specifiable element of the past seems apparent – whence the would be Whiteheadian naturalist cannot offer a satisfactory or coherent account of the origin of the novelty in discrete experience, which is the hallmark of Whitehead's own metaphysical system. (Lucas 1989: 164)

This understanding of the crucial role played by a transcendent realm completed by an immanent one in creativity and novelty is of course just as essential to an understanding of Deleuze's account of the third synthesis of time and the role of Nietzschean eternal return in *Difference and Repetition*. Equally though, this leads to the criticism that there is still too much transcendence in both philosophers as seen in critiques of Deleuze on creativity reminiscent of the early Marx's worries about Feuerbach and religion: 'Feuerbach resolves the essence of religion into the essence of man. But the essence of man is not an abstraction inhering in isolated individuals' (Marx 2006: 117).

Commenting on Deleuze's reading of Spinoza, Peter Hallward thus makes the following critical point: 'Rather than distinct facets of one and the same substance, the being-together of absolutely divergent modes can again only be thought via the pure affirmation of that unthinkable plane upon which their aberrant creating or deviant differing "consists" ' (Hallward 2006: 156). The key terms seeking to re-establish a transcendent reading of Deleuze via the idea of a lack of relation in his philosophy of creativity are 'absolute', 'pure' and 'unthinkable'. This breakdown of relations then allows Hallward to draw the following conclusion:

> Deleuze knows perfectly well what 'unifies' the field of being or creation in Spinoza isn't the idea of substance per se but the notion of God, that is, the idea of an infinity and perfection of essence. Nowhere in his work does Deleuze put in question such infinity or perfection; on the contrary his philosophy presupposes them at every turn. (Hallward 2006: 156)

Yet, if we turn to Whiteheadian arguments about this insidious return of the transcendent in a philosophy of creation, we find the counter that God (or Ideas, or the virtual or pure difference) is as much created as creating:

> The result of these truncated, one-sided interpretations of creativity, according to Nobo, has been a failure to appreciate Whitehead's full commitment to the active, creative 'power of the past' (as Whitehead himself describes it), of causal efficacy and of 'settled fact,' and of the radical subordination (from Hartshorne onwards) of efficient to pure final causality in a manner that transforms Whitehead's critical realism into a species of idealism or Kantian phenomenalism.[12] (Lucas 1989: 174)

I will show below how this argument also applies in defending Deleuze against the same charge.[13]

I want to draw on three ideas from Whiteheadian scholarship in tune with Lucas's points to show how this argument plays out in detail. The first is from a recent interpretation by Pierfrancesco Basile where he argues, completely at odds with Hallward's steps with respect to Spinoza and Deleuze, that Whitehead's metaphysics of God and world is one of *essential relation and mutual dependency*:

> [Whitehead's six antitheses] formulate a novel world view in which God and the world, although distinct, are essentially related, mutually dependent upon each other. This involves a significant revision of the traditional philosophical theology derived from Aristotle – Whitehead's God is still a mover, but not an unmoved one. (Basile 2009: 143)

The second idea comes from a more traditional source in the scholarship through Ford's critique of Neville's reading of Whitehead on God[14]:

> This creator God must be transcendent to all experience and its categories, and thus be quite unknowable. Such a God is akin to the 'causal nature' behind the scenes that Whitehead has rejected in his earlier books on the philosophy of nature. Whitehead's whole effort to achieve maximum coherence takes the form of trying to conceive of all actualities, including God, within one set of common categories. (Ford 1983: 272–3)

The use of *maximum coherence* fits with my earlier insistence on completeness in Whitehead and Deleuze. It is a point often missed in readings of Deleuze, such as Hallward's, because they take 'absolute', 'infinity' and 'perfection' as applying to the whole metaphysical picture when in fact thinkers such as Deleuze and Whitehead[15] are seeking to maximise coherence across different processes where one side may be defined as absolute or pure or unity *yet nonetheless be incomplete in*

relation to other processes, thereby requiring a maximisation against the background of creative antitheses (Whitehead 1978: 348) or creative paradoxes (Deleuze 1990: 100).[16]

So, to move to the third idea taken from Whitehead scholarship, the points about relations, mutual dependency and coherence mean that when we have a term such as potentiality it must never be seen as a pure and untouched reserve of possibility or as a creative fount or, to use Whitehead's term from earlier in this paper, as a form of eminence. This is Leclerc's careful statement of this point, where we can see why Rorty was inspired by Leclerc for his own account of the complex relation of transcendence and immanence in Whitehead's thought:

> Such potentiality is not a mere abstract possibility. It is a specific determinate possibility as potential for the subject in question. 'Potentiality' includes 'possibility' in its connotation, but potentiality in this sense is a determinate selection from pure abstract possibility [...] the purpose and function of actualization is to contribute to subsequent achievement as the potentiality for that subsequent actualisation. (Leclerc 1983: 63)

The key argument here turns on the use of 'subsequent' because it sets potential within a circle rather than at the high point of a ladder, even one that permits vibrations up and down it. Reciprocal determination in a circular motion means that there is never a pure origin in creation, or a privileged realm, *all is subsequent*, since were we to define this realm as *absolutely* primordial we would miss the fact that it is so only when it is incomplete and shorn of an essential relation that determines it as constituted rather than constituting.

To conclude then with Deleuze's own discussion of immanence in relation to transcendence in his short paper 'Les plages d'immanence', written in honour of his teacher at the Sorbonne, Maurice de Gandillac. The first thing to note is the correspondence of themes between the paper and Whitehead's reflection on transcendence and immanence studied here. Like Whitehead, Deleuze contrasts transcendence as 'eminent' and 'emanation' with immanence as a 'coexistence of two movements, complication and explication' (Deleuze 2003: 244). Complication and explication would be Whitehead's two processes of creation in relation to God: complication for the consequent creation of God; explication for the creation in the world through the pull of the primordial nature of God. Two movements whose resulting relations Deleuze describes in exactly the same words chosen by Whitehead: '*The multiple is in the one* which complicates it, as much as *the one is in the multiple* that explains it' (Deleuze 2003: 244; my emphasis). There is then a 'play' of

immanence and transcendence where the immanence of the earth (of the world for Whitehead) pushes through celestial hierarchies banishing any thought of a pure or absolute realm, yet also mixing world and God in the two processes. This is an 'adventure' of immanence in transcendence, where immanence in reflections and geneses form 'the two bases of an expressionist [and hence a Deleuzian] philosophy' (Deleuze 2003: 245). Of course, these short comments are more strongly in tune with Deleuze's early work and pertain to Gandillac, yet what I want to have suggested in this paper is that Deleuze's work is open to an interpretation where immanence and transcendence are never treated as fully separable, but rather must be considered as essentially and indivisibly related as processes. Neither term should be treated independently of the other. More importantly, as Whitehead teaches us, a great risk lies in treating one as a mere subset or as an eventually dispensable illusion within the other. I would suggest that Deleuze was always aware of this risk and that in praising Gandillac he is also adopting his measure and careful balancing of transcendence and immanence in their difficult yet life affirming relations. Should it still be said that this leads to an abstraction from life, the last word should be with Deleuze in his description of a valued individual human life in relation to all others through its creations:

> Philosophical concepts are also, for their inventors and those who release them, modes of life and modes of activity. To recognise the world of hierarchies, but at the same time to make planes of immanence pass through it, bringing it down more than any direct engagement could; that is an image of life inseparable from Maurice de Gandillac. (Deleuze 2003: 245–6)

Notes

1. This reciprocal relation or dialogue of immanence and transcendence, or one and many, is often seen as the core of Whitehead's speculative metaphysics. It underpins the reading set out here, and can be supported, for instance, through a reading of Leclerc's interpretation of Whitehead: 'The being of an ousia is its becoming, its becoming actual. And it becomes actual in order to be potentiality for further ousiai. Whitehead sees the universe as in rhythmic pulsation, from potentiality to actuality, and from actuality to potentiality, from the many to the one and from the one to the many. For him the universe is to be understood as in the process, and not statically' (Leclerc 1983: 66–7). Keith Robinson has also drawn my attention to William Christian's work for a similar emphasis on transcendence and immanence in Whitehead's work (Christian 1959). I thank him for this and other illuminating remarks.
2. For a helpful discussion of the necessity of this valuation over and above other relations, see Rose's treatment of the issue: '[. . .] while all "things" are constituted by their relations, all relations are further defined as value-relations,

that is, relations of some positive or negative character' (Rose 2002: 2). For a related account in terms of a leap into transcendence, see Whitehead (1948: 335).

3. Note how the versions of these arguments about immanence and transcendence are much more sophisticated in *Process and Reality* than in *Science and the Modern World*, for instance in the way the distinction between primordial and consequent nature expands greatly on the idea of God as 'principle of concretion' and 'principle of limitation' in *Science and the Modern World* (Whitehead 1927: 216–21).
4. For a particularly interesting account of this logical aspect of Whitehead's work, see Martin's rigorous reconstructions: '[W] wishes to elucidate "somewhat exceptional elements in our conscious experience – those elements which may roughly be classed together as religious and moral intuitions." The extraordinary appeal of Whitehead's approach is that it seeks to accommodate these exceptional elements in the same categorical framework that it seeks to accommodate logic mathematics and empirical science, and not just superficially, in a telling phrase or two, but with a reasonably full delineation of basic notions, definitions, and fundamental principles' (Martin 1974: 44).
5. Wilmot gives a full theological as opposed to philosophical reconstruction of this relation of immanence and transcendence; see Wilmot (1979: 165–7).
6. For a defence of the use of metaphysics when referring to Whitehead and Deleuze, see Robinson (2009: 132–3); see also Code (2007: 187).
7. Martin gives a good account of this mutual completion in terms of the primordial and consequent nature of God: 'God "creates" the World in the sense of providing items in it with the initial valuations or subjective aims, but the World creates God in the sense of providing the physical data for those valuations' (Martin 1974: 58).
8. See Whitehead's discussion of materialism in *Process and Reality* (Whitehead 1978: 78–9) and his definition of historical materialism in *The Concept of Nature* (Whitehead 2004: 70).
9. For an example of the use of Whitehead's thought as consistent with Christian monotheism, see Pittenger (1969: 54). For a much more developed account of the necessary move to a transcendent God based on freedom as a condition for creation and on the importance of explanations for evil, see Eisendracht: 'This theology, however triumphant, cannot be entirely sustained, for it would deny freedom and deal inadequately with the problem of evil. If God supplies the initial subjective aim of each occasion, and if He integrates all occasions into the perfection of His vision, how can Evil persist in the world?' (Eisendracht 1971: 201).
10. Wolfe Mays supports this point in drawing out the concern with religion in Whitehead's discussion of the eternal: 'We have already seen that Whitehead is concerned in his account of the concept of God's functioning in the universe, with indicating the elements of permanence or eternality in the world, with which, he claims, religion has essentially concerned itself' (Mays 1977: 130). Nonetheless it remains very important not to make the rapid step from concern with the religious drive and its value to an attunement with this or that religion and even less with this or that form of religious transcendence.
11. For an alternative critique of this reductive naturalistic reading of Whitehead, we find the perhaps surprising essay by Rorty (in his early pre-linguistic turn phase) on Whitehead where he distinguishes Whitehead from Aristotle, defending Whitehead's realist but not reductionist view of matter: 'If time is taken seriously, however, and it is thus recognised that "actual world" and "actuality" are token reflexive terms, then one can escape the first horn of

the above dilemma [that forms are indistinguishable from their actualisation] by distinguishing between the definiteness of an entity's characterisation (its "objective" reality) and the decisiveness of its concrescence (its "formal" reality). The latter is actual, and therefore non-repeatable. The former is repeatable, and therefore potential, in the sense that it is related (externally to it, although internally to each entity which prehends it) to a potentially infinite number of subsequent actualities by being "present in them" [. . .]. Its second horn [that matter and form are so different that the latter cannot characterise the former] is escaped by replying that the difference between the characterisation of the actual and the actual entity is no greater, though no less great, than between past and present – which, if one takes time seriously, is precisely the difference which one would expect' (Rorty 1983: 95–6). Rorty's fine analysis, indebted to Leclerc, is particularly acute in focusing on the role of time: an argument as important for a reading of Deleuze as anti-Aristotelian and non-reductionist. For an illuminating discussion of the relation of Whitehead to Rorty, see Hall (2004). Rorty wrote an MA thesis on Whitehead at the University of Chicago under the supervision of Hartshorne (Ramberg 2007). For an interesting discussion of the kinds of career pressures that led Rorty away from work on Whitehead, see Rorty's own comments in 'The inspirational value of great works of literature': 'But it was dear to me that if I did not write on some such respectably analytic problem I would not get a very good job' (Rorty 1998: 130).

12. There is no space here to go into the relation of Whitehead to Kant and to transcendental philosophy and deductions. For a study of this in relation to God in the context of Kant's transcendental philosophy, see Derek Malone-France (2007: 158–72). For an excellent discussion of Whitehead, Deleuze and Kant in relation to creativity and aesthetics, and Deleuze's transcendental empiricism in particular, see Shaviro (2009: 33–7).
13. There is no space here for a full reading of Isabelle Stengers' work on this question around the concept of God in Whitehead, but many of the insights in that discussion are the starting points for this study (Stengers 2002: 520–8; Williams 2009a: 156–9).
14. See Neville (1983: 267–71).
15. In no way should this rapprochement of the two thinkers be seen as a conflation of their terms; see for instance the very different treatment of the concept of multiplicity in *Process and Reality* (Sherburne 1966: 230) and *Difference and Repetition* (Williams 2003: 146–9).
16. For a fuller account of paradox in this context, see Williams (2008: 68–76).

Interstitial Life: Subtractive Vitalism in Whitehead and Deleuze

Steven Shaviro Wayne State University, Detroit

Abstract

Deleuze and Whitehead are both centrally concerned with the problem of how to reconcile the emergence of the New with the evident continuity and uniformity of the world through time. They resolve this problem through the logic of what Deleuze calls 'double causality', and Whitehead the difference between efficient and final causes. For both thinkers, linear cause-and-effect coexists with a vital capacity for desire and decision, guaranteeing that the future is not just a function of the past. The role of desire and decision can be seen in recent developments in biology.

Keywords: Whitehead, desire, biology, decision, causality

The deepest affinity between Alfred North Whitehead and Gilles Deleuze is that they both place creativity, novelty, innovation and the New at the centre of metaphysical speculation. These concepts are so familiar to us today that it is difficult to grasp how radical a rupture they mark in the history of Western thought. In fact, the valorisation of change and novelty, which we so take for granted today, is itself a novelty of relatively recent origin. Philosophy from Plato to Heidegger is largely oriented towards *anamnesis* (reminiscence) and *aletheia* (unforgetting), towards origins and foundations, towards the past rather than the future. Whitehead breaks with this tradition, when he designates the 'production of novelty' as an 'ultimate notion' or 'ultimate metaphysical principle' (Whitehead 1978: 21). This means that the New is one of those fundamental concepts that 'are incapable of analysis in terms of factors more far-reaching than themselves' (Whitehead 1968: 1). Deleuze similarly insists that the New is a value in itself: 'the new, with its power of beginning and beginning again, remains forever new'. There is 'a difference … both formal and in kind' between the genuinely

new, and that which is customary and established (Deleuze 1994: 136). Deleuze and Guattari therefore say that 'the object of philosophy is to create concepts that are always new' (Deleuze and Guattari 1994: 5). Philosophical concepts are not for all time; they are not given in advance, and they 'are not waiting for us ready-made, like heavenly bodies'. Instead, they must always be 'invented, fabricated, or rather created' afresh; 'philosophers must distrust ... those concepts they did not create themselves' (Deleuze and Guattari 1994: 5–6). For both Whitehead and Deleuze, novelty is the highest criterion for thought; even truth depends upon novelty and creativity, rather than the reverse. And it is because Deleuze and Whitehead alike take the New as the highest value, that they are both committed to process rather than result, or to Becoming as the highest expression of Being.

Of course, Whitehead and Deleuze are not entirely without precursors in their affirmation of the New as an ultimate value. Deleuze explicitly invokes Nietzsche's call for a 'revaluation of all values' and for the continual 'creation of new values' (Deleuze 1994: 136). And Whitehead and Deleuze alike are inspired by Bergson's insistence that 'life ... is invention, is unceasing creation' (Bergson 2005: 27). Whitehead and Deleuze, like Nietzsche and Bergson before them, denounce the way that, in traditional European philosophy, 'changeless order is conceived as the final perfection, with the result that the historic universe is degraded to a status of partial reality, issuing into the notion of mere appearance' (Whitehead 1968: 80). But appearance should never be qualified as 'mere', because the contents of appearance cannot be prescribed in advance. The *ways* in which things appear may well be limited, but appearances themselves are not. They cannot be known in advance, but must be encountered in the course of experience. This means that experience is always able to surprise us. Our categories are never definitive or all-inclusive. Being always remains open. 'The whole is neither given nor giveable ... because it is the Open, and because its nature is to change constantly, or to give rise to something new, in short, to endure' (Deleuze 1986: 9). 'Creative advance into novelty' (Whitehead 1978: 222) is always possible, always about to happen.

The problem, for Whitehead and Deleuze alike, is how to reconcile the emergence of the New with the evident continuity and uniformity of the world through time. In a sense, this problem is the opposite of the sceptical paradox introduced by David Hume, and which has been the primary focus of epistemological discussion for the last 250 years. Hume asks how causality is possible, given that the only ground for it he is able to discern is subjective expectation, or habit. That is to say,

Hume takes causality out of the physical world, and places it instead within the observing subject – an assumption that Kant continues to endorse, when he gives his transcendental solution to Hume's paradox. But isn't the problem of validating causality really just one, as Deleuze says in a different context, 'for the abstract thinker? And how could this thinker, with respect to this problem, not be ridiculous?' (Deleuze 1990: 156). The real problem is not to validate causality against scepticism; it is rather to find a way out from causality, an exception to the universal grip of what Whitehead calls 'causal efficacy' (Whitehead 1978: 116). How can the future avoid being predetermined by the past or by the relentless chain of causes and effects? How is it possible, in the world described for us by physical science, for anything genuinely New to emerge?

Deleuze takes up this problem in *The Logic of Sense*, by proposing a logic of 'double causality' (Deleuze 1990: 94–9). He reverts to what he describes as the ancient Stoics' 'cleavage of the causal relation' (Deleuze 1990: 6). On the one hand, there is real, or physical, causality: causes relate to other causes in the depths of matter. This is the materialist realm of 'bodies penetrating other bodies ... of passions-bodies and of the infernal mixtures which they organise or submit to' (Deleuze 1990: 131). On the other hand, there is the idealised, or transcendental, 'quasi-causality' of effects relating solely to other effects, on the surfaces of bodies and things (Deleuze 1990: 6). This quasi-causality is 'incorporeal ... ideational or "fictive"' rather than actual and effective; it works, not to constrain things to a predetermined destiny, but to 'assur[e] the full autonomy of the effect' (Deleuze 1990: 94–5). And this autonomy, this splitting of the causal relation, 'preserve[s]' or 'grounds freedom', liberating events from the destiny that weighs down upon them (Deleuze 1990: 6). An act is free, even though it is also causally determined, to the extent that the actor is able 'to be the mime of what effectively occurs, to double the actualization with a counter-actualization, the identification with a distance' (Deleuze 1990: 161). That is to say, Deleuze's counter-actualising 'dancer' makes a *decision* that supplements causal efficacy and remains irreducible to it, without actually violating it. The dancer thereby preserves 'the truth of the event', in its potentiality, from the catastrophe of 'its inevitable actualization' (Deleuze 1990: 161).

Whitehead also argues for a doubling of causality, in a way that preserves both necessity and freedom. Adapting to his own use a traditional philosophical vocabulary, he distinguishes between, but also seeks to reconcile, efficient and final causes. These two modes of causality can be correlated, to a certain extent, with the two modes of perception recognised by Whitehead: causal efficacy and presentational

immediacy. They can also be aligned with what Whitehead calls the 'physical' and 'mental' poles of any entity (Whitehead 1978: 239). Efficient causality refers to the naturalistic chain of causes and effects, or the way that an entity inherits conditions and orientations from 'the immortal past' (Whitehead 1978: 210). On this level, the causal dependency of a given entity upon its predecessors, its status as an *effect*, cannot be distinguished from that entity's prehension (its reception, or non-conscious perception) of those predecessors. 'The problems of efficient causation and of knowledge receive a common explanation' (Whitehead 1978: 190). An entity *feels* its precursors, and is thereby both *affected* and *caused* by them.

> All our physical relationships are made up of such simple physical feelings ... the subjective form of a physical feeling is re-enaction of the subjective form of the feeling felt. Thus the cause passes on its feeling to be reproduced by the new subject as its own, and yet as inseparable from the cause ... the cause is objectively in the constitution of the effect. (Whitehead 1978: 237)

Efficient causality is a passage, a transmission (Whitehead 1978: 210), an influence or a contagion. This objective inheritance constitutes the physical pole of the affected entity, its embodiment in a material universe.

However, as this process of causality-as-repetition unfolds, 'the re-enaction is not perfect' (Whitehead 1978: 237). There's always a glitch in the course of the 'vector transmission' of energy and affect from past to present, or from cause to effect. There are at least two reasons for this. In the first place, nothing can ever purely and simply recur, because of the 'cumulative character of time', its 'irreversibility' (Whitehead 1978: 237). Every event, once it has taken place, adds itself to the past that weighs upon all subsequent events. No matter how precisely event B mimics event A, B will be different from A simply due to the 'stubborn fact' that A has already taken place. The pastness of A – or what Whitehead calls its 'objectification', or 'objective immortality' – is a constitutive feature of B's world, a crucial part of the context in which B occurs. Thus, by the very fact that B repeats A, B's circumstances must be different from A's. 'Time is cumulative as well as reproductive, and the cumulation of the many is not their reproduction as many' (Whitehead 1978: 238). The effect is subtly different from the cause whose impulsion it inherits, precisely to the extent that the effect prehends (or recognises) the cause as an additional factor in the universe. Whitehead thus extends Leibniz's Principle of Indiscernibles. Not only can no two occasions ever be identical, but also 'no two occasions can have identical actual worlds' (Whitehead 1978: 210).

In the second place, the causal reproduction of the past in the present is imperfect, because no inheritance, and no feeling, is entirely neutral. The 'subjective form', as an element in the process of reception, differentially evaluates the data it receives, and thereby selects among these data. Every prehension, every causal connection, involves a 'valuation' on the part of the receiving entity: a valuation that does not just take the transmitted data as given, but 'values [them] up or down' (Whitehead 1978: 241). As a result, 'the actual world [is] selectively appropriated' (Whitehead 1978: 233), according to the 'qualities of joy and distaste, of adversion and of aversion, which attach integrally' to every experience (Whitehead 1978: 234). This affective response, with its selective and gradated 'conceptual prehension' of the qualities (eternal objects) implicit in the data, constitutes the mental pole of the affected entity, its potential for change or novelty.

Whitehead insists that every entity is 'essentially dipolar, with its physical and mental poles; and even the physical world cannot be properly understood without reference to its other side, which is the complex of mental operations' (Whitehead 1978: 239). Every entity's simple physical feelings are supplemented by its conceptual feelings. Of course, these 'mental operations', or conceptual feelings, 'do not necessarily involve consciousness'; indeed, most of the time, consciousness is entirely absent. But in every occasion of experience, both physical and mental poles are present. This means that everything happens according to a double causality. A final (or teleological) cause is always at work, alongside the efficient (mechanistic) cause. If 'transition [from the past] is the vehicle of the efficient cause', then concrescence, or the actual becoming of the entity – its orientation towards the future – 'moves toward its final cause' (Whitehead 1978: 210). As with Deleuze's quasi-cause, so with Whitehead's final cause: it does not suspend or interrupt the action of the efficient cause, but supervenes upon it, accompanies it, demands to be recognised alongside it.

For Whitehead, the final cause is the 'decision' (Whitehead 1978: 43) by means of which an actual entity becomes what it is. 'However far the sphere of efficient causation be pushed in the determination of components of a concrescence ... beyond the determination of these components there always remains the final reaction of the self-creative unity of the universe' (Whitehead 1978: 47). This 'final reaction' is the way that 'the many become one, and are increased by one' (Whitehead 1978: 21) in every new existence. The point is 'that "decided" conditions are never such as to banish freedom. They only qualify it. There is always a contingency left open for immediate decision'

(Whitehead 1978: 284). This contingency, this opening, is the point of every entity's self-determining activity: its creative self-actualisation or 'self-production' (Whitehead 1978: 224). And this is how novelty enters the universe. The decision is always a singular one, unique to the entity whose 'subjective aim' it is. It cannot be categorised or classified: for that would mean returning the decision to the already decided, to the efficient causes at the point of whose conjunction it arose.

To be sure, much of the time, this decision or final cause is 'negligible' in scope, and can safely be ignored (Whitehead 1978: 115, 245). In many inorganic physical processes, the space of 'contingency left open for immediate decision' is vanishingly small. Novelty is nearly inexistent, and linear, efficient causality can explain (almost) everything. Nonetheless, even physical science is obliged to recognise that in certain limit-cases – those involving quantum processes on the one hand, and processes of higher-order emergence on the other – linear, mechanistic causality is inadequate, and an explanation in terms of purpose, 'subjective aim' or 'decision' becomes necessary. Both quantum processes and emergent processes remain controversial among scientists today, and obviously I cannot pretend to know what the eventual scientific consensus will be. Nonetheless, it is worth at least mentioning the 'Strong Free Will Theorem' of John H. Conway and Simon Kochen, which

> asserts, roughly, that if indeed we humans have free will, then elementary particles already have their own small share of this valuable commodity. More precisely, if the experimenter can freely choose the directions in which to orient his apparatus in a certain measurement, then the particle's response (to be pedantic – the universe's response near the particle) is not determined by the entire previous history of the universe. (Conway and Kochen 2009)

In this sense, even subatomic particles make a 'decision' of some sort, one that is radically undetermined or self-determined.

In any case, the role of subjective 'decision' becomes especially important, so that it can no longer be dismissed as 'negligible' – when we get to those emergent processes of self-organisation known as living things. It is precisely in the case of living entities that the recourse to efficient causes is most inadequate, and that 'we require explanation by "final cause" instead' (Whitehead 1978: 104). Indeed, Whitehead defines 'life' itself (to the extent that a concept with such fuzzy boundaries can be defined at all) as 'the origination of conceptual novelty – novelty of appetition' (Whitehead 1978: 102). By 'appetition',

Whitehead means 'a principle of unrest … an appetite towards a difference … something with a definite novelty' (Whitehead 1978: 32). Most broadly, 'appetition' has to do with the fact that 'all physical experience is accompanied by an appetite for, or against, its continuance: an example is the appetition of self-preservation' (Whitehead 1978: 32). But experience becomes more complex when the appetition pushes beyond itself, and does not merely work towards the preservation and continuation of whatever already exists. This is precisely the case with living beings. When an entity displays 'appetite towards a difference', Whitehead gives the simple example of 'thirst' – the initial physical experience is supplemented and expanded by a 'novel conceptual prehension', an envisioning (or 'envisagement') (Whitehead 1978: 34) of something that is not already given, not (yet) actual. Even 'at a low level', such a process 'shows the germ of a free imagination' (Whitehead 1978: 32).

This means that it is insufficient to interpret something like an animal's thirst, and its consequent behaviour of searching for water, as merely a mechanism for maintaining (or returning to) a state of homeostatic equilibrium. 'Appetition towards a difference' seeks transformation, not preservation. Life cannot be adequately defined in terms of concepts like Spinoza's *conatus*, or Maturana and Varela's *autopoiesis*. Rather, an entity is alive precisely to the extent that it envisions difference, and thereby strives for something other than the mere continuation of what it already is. "'Life" means novelty … A single occasion is alive when the subjective aim which determines its process of concrescence has introduced a novelty of definiteness not to be found in the inherited data of its primary phase' (Whitehead 1978: 104). Appetition is the 'conceptual prehension', and then the making-definite, of something that has no prior existence in the 'inherited data' (i.e., something that, prior to the appetition, was merely potential). But if life is appetition, then it cannot be understood as a matter of continuity or endurance (for things like stones endure much longer, and more successfully, than living things do), nor even in terms of response to stimulus (for 'the mere response to stimulus is characteristic of all societies whether inorganic or alive' (Whitehead 1978: 104). Rather, life must be understood as a matter of '*originality* of response to stimulus' (emphasis added). Life is 'a bid for freedom', and a process that 'disturbs the inherited "responsive" adjustment of subjective forms' (Whitehead 1978: 104). It happens 'when there is intense experience without the shackle of reiteration from the past' (Whitehead 1978: 105). In sum, Whitehead maintains 'the doctrine that an organism is "alive" when

in some measure its reactions are inexplicable by *any* tradition of pure physical inheritance' (Whitehead 1978: 104).

Of course, contemporary biology is not prone to speak of final causes, or to define life in the way that Whitehead does. According to the mainstream neo-Darwinian synthesis, 'pure physical inheritance', when combined with occasional random mutation and the force of natural selection, is sufficient to account for biological variation. Innovation and change are not primary processes, but adaptive reactions to environmental pressures. Life is essentially conservative: not oriented towards difference and novelty as Whitehead would have it, but organised for the purposes of self-preservation and self-reproduction. It is not a bid for freedom, but an inescapable compulsion. The image of a 'life force' that we have today is not anything like Bergson's *élan vital*; it is rather the virus, a mindlessly, relentlessly self-replicating bit of DNA or RNA. Even the alternatives to the neo-Darwinian synthesis that are sometimes proposed today – like Maturana and Varela's theory of autopoiesis (1991), Stuart Kauffman's exploration of complexity and self-organising systems (2000), Lynn Margulis' work on symbiosis (Margulis and Sagan 2002), James Lovelock's Gaia theory (2000), and Susan Oyama's Developmental Systems Theory (2000) – share mainstream biology's overriding concern with the ways that organisms maintain homeostatic equilibrium in relation to their environment, and strive to perpetuate themselves through reproduction. It would seem that organic beings only innovate when they are absolutely compelled to, and as it were in spite of themselves.

Nevertheless, when biologists actually look at the concrete behaviour of living organisms, they encounter a somewhat different picture. For they continually discover the important role of 'decision' in this behaviour. And not only in the case of mammals and other 'higher' animals. Even 'bacteria are sensitive, communicative and decisive organisms … bacterial behaviour is highly flexible and involves complicated decision-making' (Devitt 2007). Slime moulds can negotiate mazes and choose one path over another (Nakagaki, Yamada and Toth 2000). Plants do not have brains or central nervous systems, but 'decisions are made continually as plants grow', concerning such matters as the placement of roots, shoots and leaves, and orientation with regard to sunlight (Trewavas 2005: 414). In the animal kingdom, even fruit flies exhibit 'spontaneous behaviour' that is non-deterministic, unpredictable, 'nonlinear and unstable'. This behavioural variability cannot be attributed to 'residual deviations due to extrinsic random noise'. Rather, it has an 'intrinsic' origin: 'spontaneity ("voluntariness")

[is] a biological trait even in flies' (Maye et al. 2007). In sum, it would seem that *all* living organisms make decisions that are not causally programmed or predetermined. We must posit that 'cognition is part of basic biological function, like respiration' (Lyon in Devitt 2007). Indeed, there is good evidence that, in multi-cellular organisms, not only does the entire organism spontaneously generate novelty, but 'each cell has a certain intelligence to make decisions on its own' (Albrecht-Buehler 1998).

Thus, biologists have come to see cognition, or 'information processing', at work everywhere in the living world: 'all organisms, including bacteria, the most primitive (fundamental) ones, must be able to sense the environment and perform internal information processing for thriving on latent information embedded in the complexity of their environment' (Ben Jacob, Shapira and Tauber 2006: 496). Organisms would then make decisions – which are 'free', in the sense that they are not pre-programmed, mechanistically forced or determined in advance – in accordance with this cognitive processing. This fits quite well with Whitehead's account of 'conceptual prehension' as the 'valuation' (Whitehead 1978: 240) of possibilities for change (Whitehead 1978: 33), the envisioning of 'conditioned alternatives' that are then 'reduced to coherence' (Whitehead 1978: 224). But it is getting things backwards to see this whole process as the *result* of cognition or information processing. For 'conceptual prehension' basically means 'appetition' (Whitehead 1978: 33). It deals in abstract potentialities, and not just concrete actualities; but it is emotional, and desiring, before it is cognitive. Following Whitehead, we should say that it is the very act of *decision* (conceptual prehension, valuation in accordance with subjective aim, selection) that makes cognition possible – rather than cognition providing the grounds for decision. And this applies all the way from bacteria to human beings, for whom, as Whitehead puts it, 'the final decision … constituting the ultimate modification of subjective aim, is the foundation of our experience of responsibility, of approbation or of disapprobation, of self-approval or of self-reproach, of freedom, of emphasis' (Whitehead 1978: 47). We don't make decisions because we are free and responsible; rather, we are free and responsible because – and precisely to the extent that – we make decisions.

Life itself is characterised by indeterminacy, non-closure and what Whitehead calls 'spontaneity of conceptual reaction' (Whitehead 1978: 105). It necessarily involves 'a certain absoluteness of self-enjoyment', together with 'self-creation', defined as 'the transformation of the potential into the actual' (Whitehead 1968: 150–1). All this does not

imply any sort of mysticism or vitalism, however; it can be accounted for in wholly orthodox Darwinian terms. In fruit fly brains no less than in human ones, 'the nonlinear processes underlying spontaneous behaviour initiation have evolved to generate behavioural indeterminacy' (Maye et al. 2007: 6). That is to say, strict determinism no longer applies to living things, or applies to them only to a limited extent, because 'freedom', or the ability to generate indeterminacy, has itself been developed and elaborated in the course of evolution. As Morse Peckham speculated long ago,

> randomness has a survival value … The brain's potentiality for the production of random responses is evolutionarily selected for survival. As evolutionary development increases and more complex organisms come into existence, a result of that randomness, the brain's potentiality for randomness accumulates and increases with each emerging species. (Peckham 1979: 165)

The power of making an unguided, and unforeseeable, decision has proven to be evolutionarily adaptive. It has therefore been forwarded by natural selection. Some simple life processes can be regulated through pre-programmed behaviour; but 'more complex interactions require behavioural indeterminism in order to be effective' (Maye et al. 2007: 8). Organisms that remain inflexible tend to perish; the flexible ones survive, by transforming themselves instead of merely perpetuating themselves. In this way, the 'appetition of self-preservation' itself creates a counter-appetition for transformation and difference. Life has evolved so as to crave, and to generate, novelty.

Such is Whitehead's version of double causality. Whitehead reminds us again and again that we never simply transcend efficient causality. Every experience 'is concerned with the givenness of the actual world, considered as the stubborn fact which at once limits and provides opportunity for the actual occasion … We are governed by stubborn fact' (Whitehead 1978: 129). We are impelled by the accumulation of the past, and by the deterministic processes arising out of that past. Nothing can ever violate the 'ontological principle', which asserts that 'there is nothing that floats into the world from nowhere. Everything in the actual world is referable to some actual entity' (Whitehead 1978: 244). But at the same time, these deterministic processes themselves open up an ever-widening zone of indetermination. In this way,

> efficient causation expresses the transition from actual entity to actual entity; and final causation expresses the internal process whereby the actual entity becomes itself. There is the becoming of the datum, which is to be found in

> the past of the world; and there is the becoming of the immediate self from the datum … An actual entity is at once the product of the efficient past, and is also, in Spinoza's phrase, *causa sui*. (Whitehead 1978: 150)

In this way, decision or self-determination subsists alongside, and supplements, linear, effective causality. This is a tricky argument, of course, and one that 'the popular positivistic philosophy' (Whitehead 1968: 148) will not accept. How can a subject that is entirely determined by material causes also be said to freely determine itself? Whitehead answers this by positing, not an originary subject, but rather a 'subject-superject' that is both a producer and a bearer of novelty, and that expires in the very movement by which it comes into being. Creativity, or the Category of the Ultimate (Whitehead 1978: 21), is the inner principle of freedom. It is unavoidably the case that 'whatever is determinable is determined' according to efficient causality; but at the same time 'there is always a remainder for the decision of the subject-superject' (Whitehead 1978: 27–8). And yet this decision or final cause is itself entirely immanent. The entity that makes this decision, and that is determined by it, is evanescent or 'perpetually perishing'. It fades away before it can be caught within the chains of deterministic causality. Or more precisely, its so being caught *is* precisely the event of its 'satisfaction' and passing-away. Thus,

> actual entities 'perpetually perish' subjectively, but are immortal objectively. Actuality in perishing acquires objectivity, while it loses subjective immediacy. It loses the final causation which is its internal principle of unrest, and it acquires efficient causation whereby it is a ground of obligation characterizing the creativity. (Whitehead 1978: 29)

Freedom, or the 'internal principle of unrest', is superseded by causal necessity, or the external conformity of the present to the past. The initiative that created something new in the moment of decision subsists afterwards as an 'obligation' of 'stubborn fact', conditioning and limiting the next exercise of freedom.

Although Whitehead finds the agency of decision to be at work most prominently in living organisms, his position is not that of any traditional vitalism. For

> there is no absolute gap between 'living' and 'non-living' societies. For certain purposes, whatever 'life' there is in a society may be important; and for other purposes, unimportant … a society may be more or less 'living', according to the prevalence in it of living occasions. (Whitehead 1978: 102)

In addition, if 'life' is a locus of appetition and decision, it is more an absence than a presence, more a vacuum than a force. Thus 'life is a characteristic of "empty space" … Life lurks in the interstices of each living cell, and in the interstices of the brain' (Whitehead 1978: 105–6). Life involves a kind of subtraction, a rupturing or emptying-out of the chains of physical causality. As a result of this de-linking, 'the transmission of physical influence, through the empty space within [the animal body], has not been entirely in conformity with the physical laws holding for inorganic societies' (Whitehead 1978: 106). These empty spaces or interstices are the realm of the potential, of a futurity that already haunts the present – or of what Deleuze calls the virtual. For, just as the past remains active within the present by means of the 'vector transmission' of efficient causality, so the future is already latent within the present, thanks to the 'multiplicity of pure potentiality' (Whitehead 1978: 164) that can be taken up by the living actual occasion. 'The past is a nexus of actualities' (Whitehead 1978: 214); it is still actual, still a force in the present, because it is reproduced as a 'datum', physically prehended by each new actual occasion. On the other hand, the future is *available*, without having yet been actually determined: it takes the form of eternal objects, or 'pure potentials', that may be conceptually prehended (or not) by each new actual occasion. Whitehead says therefore that, 'the future is merely real, without being actual' (Whitehead 1978: 214). Strikingly, this is the same formula that Deleuze (borrowing from Proust) uses to describe the virtual (Deleuze 1994: 208). Where Deleuze describes novelty or invention as the actualisation of the virtual, Whitehead says that 'reality becomes actual' (Whitehead 1978: 214) in the present, or in the decision of each living occasion. The process of actualisation is the hinge, or the interstice, not only between past and future, but also between the two forms of causality.

Back to Life: Deleuze, Whitehead and Process

Keith Robinson University of South Dakota, Vermillion

Abstract

In this paper I argue that Deleuze's 'thinking with' Whitehead gives access to a range of novel conceptual resources that offer a route out of phenomenology and back to life, a movement beyond intentionality and back to things 'in their free and wild state'. I lay out four conceptual and methodological markers (there are many more) – creativity, event, prehension, empiricism – that characterise Deleuze's metaphysics and provide a guide for showing how these develop through a sustained becoming with Whitehead. I conclude by looking at Deleuze and Guattari's use of the term most famously associated with Whitehead: the concept of 'process'.

Keywords: Whitehead, process, metaphysics, phenomenology, the new, creativity, event, prehension, empiricism, life

In what follows I will try to develop some ideas to show how and why Whitehead's later thought functions as a central source for a good deal of what motivates Deleuze's entire philosophical project. The main strand of my argument will be that Deleuze's 'thinking with' Whitehead gives access to a range of novel conceptual resources that offer a route out of phenomenology and back to life, a movement beyond intentionality and back to things 'in their free and wild state'. I'll begin by looking at the commitment to metaphysics in Deleuze's work and suggest that Deleuze's metaphysics, like Whitehead's, is a metaphysics of the new. I lay out four conceptual and methodological markers (there are many more) – creativity, event, prehension, empiricism – that characterise this metaphysics and provide a guide for showing how Deleuze develops these through a sustained becoming with Whitehead. I'll finish with some remarks, somewhat critical, about Deleuze and Guattari's use of the term most famously associated with Whitehead: the concept of 'process'.[1]

I. Metaphysics and Creativity

To begin then, firstly, I take it as given – or should be – that from beginning to end Deleuze is doing metaphysics. There still doesn't seem to me to be much recognition of this. I know some are smuggling it in by using the word 'ontology', but there's really no need to give up this rich term and there may be good reasons for abandoning talk of ontology in Deleuze. In my view, with Deleuze and Whitehead we move towards 'that remarkable point of modern metaphysics which all preceding discourse had indicated like a flickering compass' (Descombes 1980: 136). The 'remarkable point' of modern metaphysics referred to here is the achievement of an immanent or fully differential metaphysics that returns to 'life' and the concrete world: a thoroughgoing effort to renew metaphysics in the wake of Kant and then Heidegger. This is what Deleuze recognised in Whitehead, and this is also no doubt one of the reasons why Whitehead, like Bergson, became marginalised by professional philosophy in the latter half of the twentieth century. Deleuze didn't have a problem using the term; as he declares, simply, 'I am a pure metaphysician' (Deleuze 2007: 42). I agree with Arnauld Villani that Deleuze's affirmation of metaphysics is crucial to his entire philosophy, just as it is for Whitehead.

There is much that one could say about this affirmative transformation of metaphysics. Perhaps one of the more important aspects of Deleuze's Whiteheadian inflected renewal of metaphysics is that it operates on the basis of a new, yet incomplete, system of categories (with a new understanding of 'system' and 'category'). These are categories, as Deleuze says, that are 'not in the style of Kant, but in the style of Whitehead' (Deleuze 2007: 41), and which are drawn and 'transposed' from various disciplines and elements of experience. It is directly from Whitehead that Deleuze finds the means to retain and employ a new type of category, a 'problematic' or 'virtual' sense of category 'so that "category" takes on a new, very special sense' (Deleuze 2007: 41). These new categories are no longer tied to structures of rational necessity that represent an essentially complete and unchanging real that inevitably suppresses the different, the contingent and the anomalous. If much of modern philosophy after Kant, and culminating with Heidegger, simply abandons categorical thinking, Whitehead's singular response is to 'reform' or reinvent the category not as a structure of being or of cognition, but as the unique act or event of the self-differentiation of things. Indeed, when Deleuze says in *Difference and Repetition* that '[Whitehead's] *Process and Reality* is one of the greatest books of modern

philosophy' (Deleuze 1994: 284–5), it is because Whitehead's categories or 'empirico-ideal notions', as Deleuze calls them, are precisely an effort to move beyond Aristotelian categories of being and Kantian categories of possible experience in the development of something completely new. Categories of the Aristotelian-Kantian type, although very different in themselves, belong for Deleuze to the world of representation, where they distribute and partition being according to the laws of 'sedentary proportionality'. By contrast, Deleuze-Whitehead's own 'descriptive', 'nomadic' or 'phantastical' notions are said to be 'really open' because they preside over a distribution of difference that is not governed by representational rules. Such notions are said to betray an empiricist or pluralist sense of Ideas that collapse the 'transcendent' distinction between existence and essence, thought and being. Thus, rather than presupposing the validity of categorical thinking in the Kantian mode as the epistemological conditions for all possible experience, these 'notions' are the conditions of real experience. Deleuze invokes Whitehead's 'empirico-ideal' notions, then, as examples of a non-representational, differential and metaphysical structure or 'open' system of categories where the Kantian map of critical reason is displaced and reworked. Here categories 'in the style of Whitehead' become the immanent differences and intensities of the 'nomadic' movement and processual distribution of being itself. It is in this sense that Deleuze can say 'to my mind, the conclusion of *A Thousand Plateaus* is a table of categories (but an incomplete, insufficient one). Not in the style of Kant, but in the style of Whitehead' (Deleuze 2007: 41).

This dynamism and becoming of the real in Deleuze and Whitehead is essentially a movement of creativity and so we could say that creativity is the 'first' and general category of this new metaphysics. It seems to me that Peter Hallward's basic claim in his book *Out of This World* (2006) that Deleuze offers a metaphysics of creativity is just about right, although I think he gets a good deal of the details wrong.[2] For Deleuze, being, thinking and creativity are one. Deleuze gives us a metaphysics of creativity. If there is one designation that accurately characterises Whitehead's later philosophy, it is that it is also a metaphysics of creativity in which being, thinking and creativity are one. For Whitehead, the category of the 'Ultimate' is 'creativity'. It is, he says, 'the Universal of Universals characterising ultimate matter of fact' (Whitehead 1978: 21). We could claim that Whitehead's metaphysics is in fact the first metaphysics of 'creativity' since he actually invented the concept, the English word 'creativity'.[3] At the very least I think we can claim that Deleuze, in appealing to creativity and 'creativeness' (which

Deleuze writes in English), was thinking with Whitehead (as well as Bergson).

II. Event

Deleuze's metaphysics of creativity has a number of important constitutive elements or associated special categories. Perhaps the first such element or category to mention is the 'event'. Deleuze, of course, discusses the concept of the event explicitly with detailed attention in several books. 'I've tried in all of my books', Deleuze says, 'to discover the nature of events. It's a philosophical concept, the only one capable of ousting the verb "to be" and attributes'[4] (Deleuze 1995: 141). In his *Leibniz and the Baroque* Deleuze even uncovers a 'secret school' devoted to answering the question 'What is an Event?' Of course, the successor to this secret school, the *diadoche* as Deleuze calls him, who inherits the question of the event is none other than Whitehead (Deleuze 1993: 76). Think of all the philosophers that Deleuze could have named here. Heidegger immediately springs to mind. Why is Heidegger not the successor, or Derrida, or even Foucault, who devoted a number of texts to the idea of what he called 'eventalisation'? But Heidegger is after all the thinker of 'ereignis', the veiling–unveiling as the event of Being. It seems to me that Deleuze naming Whitehead as the successor to the question of the event is important, and it's related precisely to Whitehead's metaphysics of creativity. I'll come back to Heidegger later. In any case, it's true that Whitehead also, like Deleuze, spent a good part of his career writing about the event. I want to suggest that what Whitehead offered Deleuze here was a model or 'logic' for thinking the event in relation to creativity and the new that would come to inform Deleuze's own conception of the event.

So, for Deleuze it is Whitehead who is the successor to the question of the event, a question that reaches back, according to Deleuze, at least to the Stoics who first elevated the event to the status of a concept. The second 'great logic of the event' comes with Leibniz for whom the event is a relation, a relation to time and existence. What, for Deleuze, constitutes Whitehead's unique contribution to this school, and the third great logic of the event, is to show precisely how the event can be thought in terms of the question of the new. Whitehead's creative advance over Leibniz's event, and as we'll see over phenomenology and Heidegger, is to lay out the conditions for thinking novelty and the new in itself. Such a thinking of the event would reveal the best of all worlds: 'not the one that reproduces the eternal, but the one on which new creations are

produced, the one endowed with a capacity for innovation or creativity . . . ' (Deleuze 1993: 70).

What are the conditions for the event of the new? In *The Fold* Deleuze attributes four conditions or components to Whitehead's event and I want to suggest that each component finds an equivalent correlate in Deleuze's own event.[5] Whitehead initially conceived of events as 'extending over' each other in an infinite relation of continuity between wholes and parts. The unique novelty of an event is given by its 'passage' into another series of events either as part or whole. Deleuze makes this concept of 'extension' the first condition or component of Whitehead's event. Extensive series have intrinsic properties, 'for example height, intensity, timbre of a sound, a tint, a value, a saturation of color' (Deleuze 1993: 77). If extension gives us something rather than nothing, then 'intension' gives us 'this' rather than 'that'. Matter, or what fills space and time, always has characters, properties, degrees or 'intensities' of value that determine its texture in relation to other materials that are a part of it. The second component of the event, then, is 'intension'. A further condition of the event for Deleuze-Whitehead is the 'ingression' of eternal objects. Eternal objects are thoroughly indeterminate 'pure possibilities' and express a general potentiality unconstrained by any states of affairs, but when actualised or ingressed they instantiate fully determinate facts or forms of definiteness. However, in addition to these three components there is another. One crucial factor in the structuring of the event or 'actual occasion', as Whitehead came to call it, is its appropriation and creative use of the past in the formation of the new individual. This leads us on to our next special category and the final condition of the event of the new: prehension.

III. Prehension

The creation of the new is achieved through what Whitehead called 'prehension'. Next to creativity, and the three other conditions of the event, this is another element that converges with Deleuze's ontology and it is perhaps one of Whitehead's most important concepts. Prehension is a non-cognitive 'feeling' that guides how the occasion shapes itself from the data of the past and the potentialities of the future. Prehension is an 'intermediary', a purely immanent potential power, a relation of difference with itself, or pure 'affection' before any division into form and matter. Prehension, for Deleuze, is a passage or folding 'between' states, a movement of pure experience or perception that increases or

decreases its potential through interaction and communication with those states. As Deleuze says, 'everything prehends its antecedents and its concomitants and by degrees prehends a world' (Deleuze 1993: 78). 'All prehension', Deleuze remarks, 'is a prehension of prehension, and the event a nexus of prehensions' (Deleuze 1993: 78). The event of prehension is double-sided and 'rhythmic' in that it is the objectification of one prehension and the subjectification of another. In *What is Philosophy?* (1994) Deleuze and Guattari describe the rhythmic movement of prehension in the context of Whitehead's public/private coupling: 'The ("public") matter of fact was the mixture of data actualised by the world in its previous state, while bodies are new actualisations whose "private" states restore matters of fact for new bodies. Even when they are non-living, or rather, inorganic, things have a lived experience because they are affections and perceptions' (Deleuze and Guattari 1994: 154). Deleuze turns to Whitehead's theory of prehensions here to describe the creative ongoing rhythm of 'lived experience' as a unity with two sides or aspects. There is no ontological 'gap' or separation in the sides, only a gathering of things into a 'prehensive unification', and as the many become one so the many are increased by one. In *The Fold* Deleuze describes this two-sided rhythm of prehension through the process of perception in Leibniz. For Deleuze each distinguished or clear perception emerges through a genetic process from the dark depths of the world that is contained within each monad. Deleuze describes this double process in terms of the 'microscopic' and the 'macroscopic', terms that Deleuze borrows from Whitehead's *Process and Reality* where they are used to refer both to the two meanings of 'organism' and to the two forms of 'process'.[6] However, for Deleuze the essential difference between Whitehead and Leibniz here is that Leibniz's monad operates, famously, according to a condition of closure, whereas for Whitehead 'a condition of opening causes all prehension to be *already* the prehension of another prehension' (Deleuze 1993: 81). This condition of prehensive opening onto incompossibilitites, divergences and bifurcations – the opening onto the new in itself – is a key feature of the event in Deleuze and Whitehead that Deleuze doesn't find in Leibniz or phenomenology or, as we'll see, in Heidegger's phenomenological ontology.

Deleuze refers to prehension in several of his books. In addition to the explicit remarks on prehensions in *The Fold* (1993) and in *What is Philosophy?* (1994), especially the important concluding pages of that book, further references can be found in various places in *A Thousand Plateaus* (1987) and in the *Cinema* (Deleuze 1996a, 1996b) volumes.

It wouldn't be at all out of place in Deleuze's book on Francis Bacon (Deleuze 2003) because prehension, or its synonyms, forms the core of Deleuze's own 'theory' of perception or logic of sensation.

IV. Beyond Heidegger

So, we have creativity, events, prehensions. I want to suggest that one way of measuring the significance of these ideas in Deleuze, and Deleuze's thinking with Whitehead generally, is the extent to which they provide a conceptual route out of phenomenology, and beyond Heidegger in particular.[7] Although Heidegger challenges Husserlian phenomenology at least, as Deleuze says, 'in the "vulgar" sense of the term: with intentionality' (Deleuze 1988: 108) moving phenomenology towards ontology, Heidegger 'refounds' intentionality in a new dimension that does not allow for a fully differential relation in which difference differs from itself. This can be seen, Deleuze claims, by the way in which for Heidegger the *Lichtung* is the Open not only for light and the visible, but also for voice and sound. The Open in Heidegger, Deleuze declares,

> does not give us something to see without also providing something to speak, since the fold will constitute the Self-seeing element of sight only if it constitutes the Self-speaking element of language, to the point where it is the same world that speaks itself in language and sees itself in sight. (Deleuze 1988: 111)

For Deleuze this re-establishes an intentional relation, albeit between ontological forms rather than consciousness and its object, and if the correspondence between forms gives us the 'same world that speaks itself in language and sees itself in sight', then for Deleuze the Heideggerian ontological difference has not reached the being of difference and creativity. For Deleuze it appears that even recourse to the differentiated opening of the fourfold in later Heidegger restores an intentional field, however radicalised, that falls short of providing the conditions required for the complex and paradoxical expression of the new. Deleuze will challenge the Heideggerian *ereignis* with a new conception of the event as a pure 'differentiator' and he will look to Whitehead for the conceptual resources to construct a path beyond Heidegger's phenomenological ontology. Creativity, events and prehensions provide the outline of that path. For Deleuze Whitehead's prehension surpasses intentionality and Whitehead's event is a passage beyond being. Deleuze subordinates intentionality to prehension because the latter reaches

further back into the genetic order of experience, antecedent to any intentional relation. Prehension is an event but not of the order of the Heideggerian *ereignis* since, outside of an intentional relation, it provides the conditions for the purely creative and differential unfolding of the new.

V. Empiricism

Where does this Whiteheadian inflected path beyond Heidegger and phenomenology lead? If not back to the things themselves exactly (Deleuze says 'things in themselves in their wild state') then back to multiplicities and the radicalisation of empiricism. It was Foucault, in fact, who recognised very early on that empiricism was Deleuze's way out of phenomenology. As Deleuze says of his own metaphysics, it is 'inspired in its entirety by empiricism' (Deleuze 1990: 20). Deleuze's empiricism presides over the movement from being to event, intention to prehension, or rather the move from 'Is' to 'And' that Deleuze calls 'Life'. The path out of phenomenology and ontology leads back to life, back to 'erewhon' and things in their wild state. This is the heart of Deleuze's metaphysics. But Deleuze's empiricist metaphysics, or 'metaphysics of the concrete' to use Merleau-Ponty's phrase, is obviously not any simple appeal to lived experience nor is it an aversion to concepts. Rather, the 'secret of empiricism', for Deleuze, is that it is the most insane creation of concepts in which, as we have seen, the concept becomes the thing in itself in its free and wild state. How do we find the conditions of a life, or the conditions of a novel experience in-the-making? Philosophically, it is possible by following a multiplicity long enough to create a concept that corresponds to it. This is precisely the demand of a metaphysics of creativity: it is an experiment with the 'outside', Deleuze would say, in which he 'never renounced a kind of empiricism that sets out to present concepts directly' (Deleuze 1995: 88–9). What is the source of this empiricism in Deleuze? Rather than classical British empiricism, the source of this empirical metaphysics is deeply Whiteheadian. In the preface to the English translation of his *Dialogues*, Deleuze says:

> I have always felt that I am an empiricist, that is, a pluralist. But what does this equivalence between empiricism and pluralism mean? It derives from the two characteristics by which Whitehead defined empiricism: the abstract does not explain, but must itself be explained; and the aim is not to rediscover the eternal or the universal, but to find the conditions under which something new is produced (*creativeness*). (Deleuze and Parnet 1987: vii)

Why doesn't Deleuze refer to Hume or Bergson here? One answer is that Deleuze's Whiteheadian 'empirical pluralism' is more attuned to dispelling the illusions (the eternal, universal, etc.) and 'images of thought' that prevent us from thinking the creativity and novelty of experience in itself. With the illusions dispelled, the conditions under which something new is produced can be made visible, enabling the construction of a plane of immanence that is a 'radical empiricism' (Deleuze and Guattari 1994: 47). Radical or 'transcendental' empiricism will not only reveal the extent to which phenomenology still participates in these illusions but, as an innovative thinking of the conditions of real experience, it enables a decisive break with the ultimate illusion: the verb 'to be' and its attributes, so that finally 'is' yields to 'and'. As Deleuze says, 'empiricism has no other secret: thinking with And instead of Is. It is quite an extraordinary thought, and yet it is life' (Deleuze and Parnet 1987: 57).

VI. Process

To summarise so far, Deleuze offers an empirical metaphysics whose ungrounded 'first principle' is creativity. Creativity creates events and is itself an event. Events are prehensions of prehensions, experience in the making. So we have creativity, events, prehensions, all little conceptual paths or 'lines of flight' out of phenomenology, out of 'being', and back to life. These are the concepts that Deleuze constructs with Whitehead in order to lay out and populate a plane of immanence. Perhaps this is even enough to believe in the world again. But there is one other concept I'd like to add, one other crucial Whitehead element that converges with Deleuze's ontology and that is, of course, the concept of 'process'. Creativity, events, prehensions: they are all processes. To shift into a more critical mode for this final section I want to ask whether process in Deleuze and Guattari fully reaches the conditions of the new and passes through the 'empiricist conversion' that creativity, events and prehensions undergo.

Although it is widely used throughout Deleuze and Deleuze and Guattari's work, I want to suggest that process is a concept that they never really explicitly theorise or 'create'. Yet, they use it as a neutral conduit or vehicle for discussions of many of their own most important concepts, including 'difference', 'desire' and 'becoming'. 'Process' in Deleuze, and in Deleuze and Guattari, always appears as subordinate to 'difference', 'becoming' or 'desire'. 'Process' is always in a relation of dependence, and it is never given its 'own' concept, never thought

'in-itself'. For Deleuze and Guattari there appears to be no philosophical school, secret or otherwise, devoted to answering the question 'what is a process?'

Indeed, just as the concept of process tends to be a necessary yet invisible support to the primary terms of the Deleuzian conceptual repertoire and process philosophy is overlooked as a positive tradition in Deleuze himself (a kind of 'anxiety of influence' since he prefers the invention and creation of his own schools and 'traditions', for example, the school of the event, the tradition of 'univocity'), recognition of process thought, and the idea that it might play a key role in Deleuze's own intellectual formation, is almost completely absent in the reception of his work. A few readers of Deleuze have invoked the concept of 'process' – most notably Manuel De Landa – in their reading of his texts, but this is only to include the concept as an empty placeholder within their descriptions and commentaries on Deleuze without ever subjecting the concept to a detailed explication or critical analysis. Thus, Deleuze, Deleuze and Guattari and some of their most well-known interpreters appropriate and rely upon a concept of process for their own theoretical practices and procedures without engaging in a 'genealogy', genesis or 'immanent critique' of this concept or tradition.

This claim would need to be elaborated at length and given detailed support, which I can't do here. But let me give just one example: in *Anti-Oedipus* process is used ubiquitously and deployed as a synonym for the sub-representative order of temporalisation and its expression as the three syntheses of time (developed in Deleuze's *Difference and Repetition*). This takes the form of a three-fold concept of univocal process as production (present), as 'producer-product' (past) and as a process without a goal or end in itself (future): the three syntheses of process. Desire is the process of passive syntheses (connective, conjunctive and disjunctive), the primary order of process, working themselves out in the secondary order of the real as product. Thus, production as process is the immanent principle of desire accounting for the movements and activity of the unconscious syntheses. For Deleuze and Guattari, whether we invoke social (political, economic or labour) processes on the one hand, or libidinal processes on the other, desiring production is one process of reality. In my view process does a lot of work in these distinctions and discussions, but that work – *precisely as a process* – is not examined as such. They discuss the process *of* desire but not process itself. In Deleuze and Guattari, process is always immanent *to* desire or difference, immanent to something other than itself. Another way of putting this point is to say that process in Deleuze

and Guattari risks being reduced to a dependent state or condition of something else and not an act in itself, especially since processes are always 'of' schizophrenia, difference or becoming.

My worry, then, is that process in Deleuze and Guattari is in danger of failing what Deleuze calls the 'empiricist conversion', in danger of functioning as an abstract (and transcendent) substratum that differences or becomings move along or undergo, identical with its manifestation as difference, becoming and so on. One suspicion here is that Deleuze and Guattari's use of process is effectively a 'blind spot' in their work resting on unquestioned assumptions about process embedded in the tradition of Western philosophy. One main assumption of that tradition is that process can only be admitted into ontology, if admitted at all, if it functions as a predicate dependent upon particulars like things or persons. It is precisely this assumption that Whitehead had rooted out in *Process and Reality* by developing a concept of the event as actual occasion in which being gives way to the reality of process. Process is of course not predicated of things and persons in Deleuze and Guattari, but it is arguably functioning as a silent predicate of events, differences and becomings. Roughly, what Deleuze said about the relation between substance and modes in Spinoza I want to say about the relation between difference and process in Deleuze. Did Deleuze and Guattari let their guard down when it came to process?

For process to achieve immanence in Deleuze it would require a full ontological 'destruction' or, in Deleuze and Guattari lingo, a thorough destratifying and 'empirical conversion' of its traditional sediment so that it may be turned towards its creative potential. Process must be shown 'processing'. Rather than make difference turn around another substance substitute, perhaps one of the real potentials of the Deleuze-Whitehead encounter lies in making process coalesce with and turn around difference. Only then will process be fully differential and difference fully processual.

Notes

1. This is a longer version of a paper presented at the session on 'Deleuze, Whitehead and Process' at the 1st International Deleuze Conference, University of Cardiff, Wales, August 2008. I'd like to thank James Williams for valuable comments on an earlier draft.
2. I don't have space to properly defend this here but I can't agree with Hallward's insistence throughout his book *Out of this World* on a 'unilateral configuration' of creativity such that creativity divides into an 'active *creans*' and a 'passive *creaturum*' (27). For Hallward creating is active and virtual and the created is

actual and passive. In my view there are indeed different modes of creativity in Deleuze but it is as true to say that the virtual is active and the actual passive as to say that the virtual is impassive and the actual active. In fact, just like Whitehead, each half of reality in Deleuze has two sides and one can only begin to account for Deleuze's thought when justice is done to the constant movement, exchange, translation, tension, struggle, displacement and conversion between both of these halves and their sides. In one way or another the effort to attribute simple hierarchical dualisms to Deleuze, and the determination to polarise his thought, characterises not only Hallward's book but also the books on Deleuze by Badiou and Žižek. Whereas Badiou insists that Deleuze choose (and has already chosen) between animal or number, one or multiple, Plato or Aristotle (and a bunch of other dualisms) in accordance with a formally determined 'axiom of choice', Žižek claims that Deleuze's work rests on 'two conceptual oppositions' that are incompatible: the logic of effect and the logic of production. Žižek uses this distinction to divide Deleuze's texts: '*The Logic of Sense* versus *The Anti-Oedipus*' and to separate Deleuze from Guattari. Although a number of commentators have objected, rightly, to these reductionist and divisive strategies and to their sometimes narrow and misleading emphases (e.g., Hallward on the 'theophanic', Badiou on the 'One'), one virtue (among numerous others) is that both Hallward and Badiou situate Deleuze under the sign of metaphysics.

3. I thank Steven Meyer who persuaded me of this. See his introduction to *Configurations* 13(1) Winter, 2005.
4. The idea that, as Deleuze says, the event 'ousts' the verb 'to be' is important for my claims here since it suggests an overturning of ontology, or the subordination of 'is' to 'and'. In other words, I'm suggesting that Deleuze offers a metaphysics that, after *Difference and Repetition*, attempts to 'twist free' of ontology, a metaphysics of the creative 'and, and, and …' where the creative event supersedes being. In this respect Heidegger, for Deleuze, remains tied to ontology and never really breaks with the 'isness' of things and the verb 'to be'. That Deleuze's model of the event and its folds is informed by Whitehead, not Heidegger, is explored in more detail in my 'Towards a Political Ontology of the Fold: Deleuze, Heidegger, Whitehead and the Fourfold Event' in *Deleuze and The Fold: A Critical Reader* (Robinson 2010a).
5. Deleuze's concept of the event receives various formulations in his work but the basic structure is well known: on the one hand a state of affairs that relates to actualised bodies and individuals and, on the other, an incorporeal reserve of infinite becoming and virtual movement. Treating this structure as a simple hierarchical dualism has been used to give a distorted image of Deleuze's thought (see note 2 above). I suggest that a better image is the 'between-two' or 'fourfold' where each component is internal to and completed by the other. In terms of the Deleuze and Whitehead event extension, intension, prehension and ingression each have a virtual/actual side and the process of conversion between them is carried out by different modes of creativity. Deleuze describes this in his own terms when he refers in both *Difference and Repetition* and *Logic of Sense* to 'two dissymmetrical halves'. In *Difference and Repetition* he says that 'everything has two odd, dissymmetrical and dissimilar "halves", …, each dividing itself in two' (p. 279–80). The dissymmetrical halves then become the '*entre-deux*' or fold between two that informs his reading of the event in Whitehead. For more on the event and the need to think it in terms of 'two multiplicities', see my "Between the Individual, the Relative and the Void: Thinking the 'Event' in Badiou, Deleuze and Whitehead" in *Event and*

Decision: Ontology and Politics in Badiou, Deleuze and Whitehead (Robinson 2010b).

6. That Deleuze is borrowing these terms from Whitehead is confirmed by a footnote in *The Fold*. See Chapter 7 note 7 in *The Fold*: 154.
7. Deleuze studies still do not tell us that much about how to situate Heidegger in relation to Deleuze. Nor for that matter do Heidegger scholars. One exception is Miguel de Beistegui in his *Truth and Genesis* (2004). I suggest that Heidegger is Deleuze's primary philosophical rival and that Alain Badiou, in his book on Deleuze, is quite canny when he suggests that Deleuze himself didn't recognise how close he was to Heidegger. *Difference and Repetition* is one of the primary texts where Deleuze's indebtedness to and rivalry with Heidegger is played out and the conspicuous absence of Heidegger in *Logic of Sense* suggests that it is Deleuze's first 'post' Heideggerian book in which being is no longer the highest term, giving way to the event. The path beyond Heidegger is developed subterraneously in many of Deleuze's books but surfaces again explicitly in *Foucault* and *The Fold* (and to a lesser extent in *What is Philosophy?*), albeit in a highly compressed set of claims and arguments.

Book Reviews

James Williams (2008) *Gilles Deleuze's Logic of Sense: A Critical Introduction and Guide*, Edinburgh: Edinburgh University Press, 219pp.

Originally published in 1969, *Logic of Sense* has an ambiguous place within Gilles Deleuze's work as a whole. Along with *Difference and Repetition*, which appeared the year before *Logic of Sense* came out, it is arguably one of his two most important single-authored books, but it is often overlooked by Deleuzians. This may have something to do with the fact that it has a rather hybrid quality: it is highly philosophical, drawing powerfully on Stoicism and having an ambivalent but important relationship with Husserl, but it is also steeped in structuralism, semiotics and psychoanalytic theory. The latter are the main reason for the relative neglect of *Logic of Sense*: they are often seen as the 'old-fashioned' ideas that Deleuze was soon to be 'freed' from by Guattari. However, it could be argued that there are genuine links with the later joint work, in particular the division of *Logic of Sense* into *séries*, which is very similar to the way in which *A Thousand Plateaus* is structured, but it is also a very valuable book in its own right. It engages with structuralism, semiotics and psychoanalytic theory in as fertile a way as Deleuze does elsewhere with earlier philosophers. There is a tendency to assume that the later joint work left such writers as Lévi-Strauss and Lacan behind, but there continue to be fresh interpretations of these writers as thinkers, so it is still worth exploring the boundaries between their ideas and those of Deleuze and Guattari.

Logic of Sense is also probably closer to critical theory than any other extended work by Deleuze, mainly because it explores language and meaning in such detail and with such richness. It is closer to a complex hermeneutics than the concentration on affect and how the arts 'do' philosophy within their own material terms that one associates with Deleuze. There is also an affinity with the fascination of French philosophers such as Derrida and Marin with performatives and linguistic pragmatics, although there is a compelling mix of meaning, being, event and change that goes beyond textuality in *Logic of Sense*.

Even if Deleuze and Guattari 'left behind' performatives and pragmatics, there is a peculiar mystery of immanence in language in Austin's ideas that can still be explored in relation to their work. It is well known that *Logic of Sense* uses *Alice in Wonderland* as a key text for developing its arguments, but there is another dimension behind this: as Charles Dodgson, Lewis Carroll was a professor of mathematics at Oxford and contributed to the analytic tradition's work on logic and paradox. The sections of *Logic of Sense* devoted to meaning, nonsense and paradox are much closer to this tradition than one might think, even if Deleuze is concerned to go behind propositionality and has a more embodied sense of paradox, which partly explains the use of *Alice in Wonderland*.

In general, what Deleuze has to say about being, event and process within a wider context of creative connectivity deeply challenges received approaches to the world and brings one closer to reality. There are also rich implications for a different model of social justice. Deleuze has a visionary quality as a writer, and he can produce powerful surges of affect in a sympathetic reader, but it is sometimes good to rein in that response and engage in a sober way with the astonishing power of his philosophical engineering: the architecture of the future can be as much about new building materials as it is about new ways of imagining space. The key to Deleuze's concepts lies more in the relational tools that bind and do not bind them together than in the concepts themselves. In a sense this is only to be expected in a philosophy that is about a shift from identity to an evanescent but semi-solidifying and individuating connectivity.

James Williams' remarkable *Gilles Deleuze's Logic of Sense: A Critical Introduction and Guide* deals very sustainedly with the philosophical engineering, which makes it a demanding but extremely valuable book. Williams has already produced a comparable – and excellent – book on *Difference and Repetition* (Williams 2003), a work that is primarily concerned with ontology, although Deleuze's ontology is more about becoming than being as it is normally conceived. Perpetual variation in the universe comes from the interaction of an asymmetrical, reciprocally determined binary pair, the virtual and the actual. This ontology, with certain additions and minor changes in terminology, appears again in *Logic of Sense*, but the binary structure is applied to other areas, producing new pairings: language and sense, human action and the unconscious, and two different conceptions of time. These pairs interconnect and overlap in very complex ways. Sense is also closely associated with the event, a concept drawn from Emile Bréhier's classic work on incorporeals in Stoicism.[1] The event is not the physical

happening itself, while sense contains the difference between the before and after of the physical happening. What is fascinating about *Logic of Sense* is how becoming and meaning are intertwined: a rich fabric of different latent forces is woven around the actual and a bridge is established between the personal wound and the universal.

Williams does not give a line-by-line commentary: indeed he often jumps intelligently around the *séries* that make up the main body of *Logic of Sense* in order to construct his arguments. Nevertheless, he more or less follows the overall movement of Deleuze's text across his central four chapters: 'Language and event', 'Philosophy as event', 'Morals and events' and 'Thought and the unconscious'. These chapters are framed by an introduction and a short conclusion. Williams explains the philosophical engineering in great detail, tries to show how a philosophy that can seem very abstract is relevant to real-world situations, defends that philosophy against possible objections, in particular from the analytic tradition, and is sensitive to the more aesthetic and psychologically complex sides of *Logic of Sense*, which may reflect some of Deleuze's own vulnerabilities: he lived as a young man in the shadow of his older brother, who had been killed in the Resistance, and he had a lung removed in the very year the book came out. Williams deals excellently with the treatment of moral actions, especially the way in which three literary figures with vulnerable qualities – Péguy, Bousquet and Fitzgerald – are used as part of that treatment. He also has a good understanding of the general relationship between Deleuze and psychoanalysis, although he is less assured with some of the more detailed arguments, and he does not quite convey how essential the presence of a subtly modified psychoanalysis is to the overall vision of *Logic of Sense*.[2]

However, what is superb about Williams' book is its exposition of the philosophical engineering of *Logic of Sense*: numerous concepts, all fascinating and specific to Deleuze (his philosophy was very much about the creation of novel exploratory concepts), are examined in an extended, highly detailed and rigorous way. They include the following: event, series and disjunctive synthesis; sense as infinitives and its relationship to nonsense and meaning in the proposition; paradox; the interplay of the series of the signifier and signified; the three images of philosophers; height, depth and surface; singularities; the nature of problems; static and dynamic genesis; 'higher empiricism' (there is a good discussion of Deleuze's response to Husserl); 'quasi-cause'; time and counter-actualisation. All these concepts are made fully available to the reader as tools for his or her own use.

The chapter on 'Language and event' is particularly good, with a thorough and extremely clear treatment of Deleuze's ideas on signification, sense, paradox and nonsense. Here, fruitful parallels are drawn with the analytic tradition. Deleuze's very profound conception of time is dealt with in a number of places, and there is an interesting comparison between his approach to it and that of Badiou.[3] Williams also explains the concept of the three images of philosophers very well, showing how it can be a tool for avoiding the binary oppositions that beset the way in which the history of Western philosophy is structured. Throughout the book, the position of Deleuze in relation to such binary oppositions as transcendental-immanent or empiricist-metaphysician is negotiated with exceptional subtlety. There are also occasional but illuminating references to quite a few other works by Deleuze. Williams is also sensitive to Deleuze's style in French and communicates the complex mixture of rigour, sensibility and energy that is to be found in *Logic of Sense*.

One slight quibble might be that Williams does not always succeed in communicating how the asymmetrical binary pairs and the individual concepts fit together and function as a whole. This is partly because he is trying to avoid oversimplification but also because Deleuze himself tends to employ the exceptionally plastic quality of his language and imagination rather than pure argument to conjure a more holistic impression of how the universe is for him. It is also possible that the structuralist elements in *Logic of Sense* give it a symmetrical quality, but this makes it all the more useful for exploring a potential disjunction between what could be binary or dialectical human thought and 'cosmic thought', which would be very different.[4]

Any minor faults should not detract from the fact that Williams has done something comparable to producing the first commentary on one of Kant's *Critiques* and that he has done so in an intellectually formidable and deeply passionate way: he has been worthy of the event.

Adrian Parr (2009) *Hijacking Sustainability*, Cambridge, MA: MIT Press, 209pp.

As a poststructuralist who teaches Deleuze and Guattari in a School of Architecture, Planning and Landscape, I seized the opportunity to review *Hijacking Sustainability*. 'Sustainability' has become an important trope in many space-related narratives and has produced such a range of truth effects that it may now be regarded as international orthodoxy for government-led spatial planning. 'Sustainable communities' are all the rage, from eco-towns in the UK, to eco-villages in Europe and the USA. The much-vaunted 'triple-bottom-line' of sustainability adds economic and social sustainability to that of eco- or environmental sustainability, implied above. As *Hijacking Sustainability* clearly demonstrates, however, the three elements often conflict, with economic 'sustainability' (also known as corporate viability or shareholder profit) dominant.

Adrian Parr is interested in applying Deleuzian ideas in the context of politics, transcultural studies and ethics. In her previous work, *Deleuze and Memorial Culture* (Parr 2008), she suggests that trauma, given a transcendent meaning, produces a despotic connective synthesis. Her argument in *Hijacking Sustainability* is not dissimilar: sustainability has also achieved transcendent meaning and despotic connective synthesis, as her transcultural examples illustrate. Parr concludes *Hijacking Sustainability* by seeking a more socially and environmentally just ethical connective synthesis.

Parr demonstrates clearly how sustainability is a cultural construct: an empty signifier, meaning everything and nothing. Sustainability has

become a buzzword, evocative of a 'good thing', which carries – indeed hijacks – universal acceptability when attached to a wide range of things, from housing to burgers, celebrities to warfare.

Deleuze and Guattari (1994) characterise philosophy as the creation of concepts through which knowledge can be generated. They use the term 'order-word' (*mot d'ordre*) to describe a linguistic function compelling obedience: order-words 'tell people what to think' (Conley 2005: 193). The word *mot d'ordre* also means a slogan or a military password in French: highly relevant to Parr's case illustrations of the militarisation of life in the name of 'sustainability'. Order-words – such as sustainability – are not commands as such, but rather terms which relate implicit presuppositions and speech-acts to social obligations, and which produce tangible effects (Deleuze and Guattari 1987: 79). If we understand sustainability as an order-word, we ask, not what it means, but, like Parr and her examples in *Hijacking Sustainability*, how the power-laden term 'sustainability' works and what it produces in practice.

Several of Parr's examples demonstrate the strong ideological power of sustainability when combined with the signifier 'development'. Yet the two signifiers often contradict and negate each other: their rhetorical acrobatics creating merely illusion – language without possibility (Gunder and Hillier 2009). The sustainable development of eco-villages (Chapter 3), for instance, purports to be grounded in scientific 'fact' (of lower carbon footprints, of social bonding and so on) even if sustainability is itself indefinable and unachievable (as in a reality of car commuting to work and parochial neighbour conflicts). Yet such forms of violence are legitimated by the sublime truth of an unknowable transcendental ideal.

In *Hijacking Sustainability* Parr illustrates how sustainability has become 'a political attitude of the multitude' (4): a non-dualistic social practice which largely masks economic 'business-as-usual', with associated 'usual' disproportionate negative impacts on the poor. Parr's provocative interrogation of examples – including the provision of culturally appropriate disaster shelters in Asia (Chapter 7) and the 'greening' of the US White House (Chapter 4) – indicates how sustainability is akin to a Trojan horse, outwardly seen as 'good', while obscuring the corporate interests, government and military 'bads' hidden inside. The book discloses the voids and illusions of situations and supports activation of agency for the currently disenfranchised.

Sustainability pulls together assemblages of strange bedfellows, such as BP oil, Wal-Mart (Asda), the North American Sustainable Use

Specialist Group, the US Military, UNCHR and even, I would add, Prince Charles. Parr traces how sustainability has been coded in various situations, with various results. For instance, US President Jimmy Carter installed solar heating panels on the White House roof in the name of energy efficiency. Carter's successor, Ronald Reagan, removed the panels to demonstrate America's 'abundance of resources' (72). Bill Clinton, in turn, wanted the White House to symbolise 'a model of efficiency and waste reduction' (73). He ordered the replacement: of the White House roof to maximise thermal integrity; of incandescent light bulbs with fluorescents; of old air-conditioning units, refrigerators, windows and so on, and so on, saving some 845 tonnes of carbon a year. The presidencies of the two George Bushes, however, saw sustainability recoded as being an individual, voluntary choice. Neither Bush volunteered to publicise the presidential residence as a 'Green' House, when espousing policies of militarism and neo-liberalism, refusing to sign the Kyoto Protocol or creating a 'midnight rule' to bar consideration of global warming as related to the predicted extinction of polar bears. Parr's examples unveil the violences which make such enunciations and actualisations possible in the name of 'sustainability'.

Resonating more with Félix Guattari's (who is not mentioned in *Hijacking Sustainability*) writing (see especially 1995, 2000) than with that of Gilles Deleuze, Parr demonstrates how sustainability culture is not only a response to perceived 'problems', but also helps to create them in the first place. Dominant modes of valorisation are translated into political and economic programmes newly labelled as 'sustainable', such as General Motors' Hummer O^2. Dominant values subordinate everything under the imperative of a worldwide market and put social relations under the power of police and military machines. The 'double-sway' of the market and military-industrial complexes, and their bracketing of problems such as poverty, racism, social justice and so on, is clearly articulated.

In Part 1, Parr traces the conditions of possibility of five case examples. She demonstrates the popularisation of sustainability culture such that everyone wants to be associated with its feel-good brand. Consumption of 'junkspace' is increasingly greenwashed (Chapter 1), so that driving one's Hummer to shop in urban fringe Wal-Marts becomes environmentally and socially sustainable. Hollywood and its celebrities have enjoyed similar make-overs (Chapter 2), from the Oscars to celebrities pictured in proximity to cute, endangered species (though noticeably not endorsing campaigns such as Save the Slug![1]).

As a scholar of cultural studies, Parr cannot explore the depths of sustainability which a planner, architect or sociologist might. I personally disagree with aspects of the, somewhat idealist, analysis of eco-villages (Chapter 3), as embodying 'real' social and environmental sustainability compared with sub/urban gated communities. I would argue that eco-villages, as lines of flight from urbanisation, also harbour potentialities to perform as control societies, excluding 'others' whose views and behaviours do not fit the norm. Research into eco-villages suggests that there are potential problems: of engaging 'neo-primitivism', of extensive use of land, of cultural and social homogeneity, of car-travel to services and facilities, and so on (Barton 1998; Cummings 1999; Sizemore 2004; Sullivan 2008). Eco-villagers tend to opt out of the mainstream. While I do not criticise them for doing so, I would rather attempt to change the mainstream; to think transversally and to embrace more eco-sustainable ways of living, perhaps along the lines suggested by Félix Guattari's ecosophy and *Three Ecologies* (1995, 2000): 'ecology must stop being associated with the image of a small nature-loving minority' (2000: 52).

Like eco-villages, military sustainability represents striated space (Chapter 5). The idea of greening the military would seem a difficult concept to accept when related to agencies which count land mines and cluster bombs, depleted uranium and phosphorus in their arsenals. Yet the US Army now has goals of sustainability, including acting with integrity (79). As Parr indicates, however, sustainability becomes even more of an empty signifier in military usage. Traditionally an oppressive structure of domination, military 'sustainability' tends to bracket issues of environmental and social justice in favour of equating sustainability with US national security in broad terms. Recently introduced techniques, such as those of urban warfare, including human technology mapping (HTM), while 'badged' as sustainable, take violent conflict directly into the homes, for instance, of Iraqi and Palestinian citizens, as armed military personnel blast holes through walls between adjoining houses and regard men, women and children as suspected terrorists (see Weizman 2006). Meanwhile, in the US and UK, those branded as merely 'potential' environmental activists are arrested in police swoops legitimated by anti-terrorism legislation (Taylor and Vidal 2009).

Ironically, as Weizman points out, military institutions' reading lists often include texts by Deleuze and Guattari, whose work on rhizomes and assemblages, smooth and striated space and war machines has

influenced military thinking. In this way, Parr's picture of the 'increasing militarisation of life' (4) illustrates a relation between Deleuze's and Guattari's theory and practice which all the authors would surely find abhorrent.

Hijacking Sustainability interrogates practices of sustainability and raises critical questions about subjectivity, power and desire. In Part 2, particularly, Adrian Parr challenges orthodox thinking (the Deleuzian image of thought) on sustainability and indicates how such doxa must be resisted and replaced with new socio-ecological concepts if things are to change.

Chapter 6 on waste/trash indicates not only how a culture of consumerism is accompanied by a culture of disposability, generating huge volumes of 'rubbish' (another social construct) which must be hidden from view, but also how the poor are often themselves regarded as trash within the social fabric. Garbage dumps, incinerators and shiploads of toxic waste are thus located or dumped by the powerful on the world's poor: 'power, as used in environmental discourse, entails the privilege to decide whose communities are polluted and whose are spared, to define what constitutes a recyclable material on the soil of a developed country, and in turn to choose which environments can be sacrificed like common waste' (102). Parr argues that the 'key' is 'to create a sustainable connection with the environment by attending to the processes of change implied within that connection' (107). In doing so, we need to recognise that sustainability culture is a Western social construct within a Western plane of reference. We risk further subordinating other economic, social and cultural practices, both at home, and especially in the Global South, if we fail to break down the dominant framework and develop a more communal ethic.

Hijacking Sustainability tackles the idea of urbanism as a process of signification with relation to disaster relief shelters and slum dwelling (Chapters 7 and 8). While I am unsure that 'disaster is indiscriminate' (110), as some people are always more affected and disadvantaged than others, who may even benefit from disaster situations, I agree that there should not be universal solutions, copy-pasted across different circumstances. There is a need to examine the materialities and expressivities of disaster relief and slum clearance alike, to unpack the force relations between elements, to trace and map potential trajectories and to stimulate creative opportunities, or lines of flight, as appropriate.

Parr mentions the importance of informality in Latin American slums. She tends to regard informality rather negatively, however, compared with authors such as Ananya Roy (2009) who challenges what she

regards as such a traditional, hegemonic view of binary opposition. Roy demonstrates how and why informality is both far from unregulated and an internally differentiated mode of spatial production. Roy transcends the debate by reconceptualising informality as an oblique mode of power, or 'making do', which can be simultaneously legal and non-legal, regulated and deregulated, the rule and the exception.

Sustainability is concerned with the not-yet, with ensuring that something remains for the people-to-come. As such, Parr advocates a form of 'machinic urbanism' in which planners and designers would 'experiment with the material movements of life in all its variation' (141). Machinic urbanism would produce connections and relations between elements to stimulate challenges to traditional economic, environmental, social and cultural doxa, to create lines of flight and alternative discourses from which to imagine, or fabulate, different futures (see also Hillier (2007, 2009) for a spatial planning perspective). Parr's machinic urbanism aspires to create conditions of agency without structural constraints. This would involve overturning traditional capitalocentric values, in favour of new forms of social innovation, such as social businesses in diverse economies (see also Gibson-Graham 1996) which have the potential to release the dynamic materiality of life.

Hijacking Sustainability is a book for cultural geographers and cultural studies students. It successfully lifts the veil on crucial issues which lurk beneath sustainability culture. Adrian Parr clearly illustrates how sustainability rhetoric performs as a veil or smokescreen to cover the often-violent business-as-usual of economics and politics. The key question is how might we reimagine and rearticulate sustainability, not as a justification mechanism for yet more pro-market consumption, but as a means to displace economic and militarist imperatives from their domination of the wicked issues of class, social and environmental justice. Making progress requires a massive change of political, social and cultural mindset: one which reorients the objectives of material and immaterial production (Guattari 2000) and one which is sufficiently strong to resist co-optation by vested interests, as happened with 'sustainability'.

Students will find this a provocative and stimulating book, as I did, though I fear the extremely brief index is of little value. The case examples are Americas-dominant and it would be good if further editions could incorporate not only some non-Western cases from the Global South, but also some of their different views and approaches to sustainability.

I congratulate Adrian Parr on *Hijacking Sustainability*, a text which lays bare the problems of the sustainability culture and offers us the beginning of a Deleuzian- (and Guattarian) inspired escape forward which the planet so badly requires.

Bernd Herzogenrath (ed.) (2009) *Deleuze/Guattari and Ecology*, Basingstoke: Palgrave Macmillan, 290pp.

In his contribution to *Deleuze/Guattari and Ecology*, Hanjo Berressem suggests that Felix Guattari's later texts, which contain his more explicit dealings with ecology, were 'a fallout of his general project … [Guattari's] ecosophy is more comprehensive than the more visible and mainstream versions of ecology' (60). This also suggests a helpful way in which to conceptualise the aim of Bernd Herzogenrath's collection. Certain disciplinary histories of ecology indicate that this field of study devoted to organisms, environments and their interactions has itself evolved into something of a fallout *without* a general project. For instance, Dana Phillips's *The Truth of Ecology* (2003) highlights a self-alienating tendency that has crippled ecology as an academic enterprise. On the one hand, scientists in ecology push forward without being able to sustain their own body of theories and methods from dismantling critiques by physicists and biologists who enjoy a tradition of well-established facts and core concepts; on the other hand, scientific research in ecology often gets skewed into a utopian holism by popular environmental movements and oversimplified by the pastoral assumptions besetting most ecocriticism. Ecology, apprehended in this restricted and isolating manner, is in need of structural couplings with a generalised ecology towards which Herzogenrath's collection gestures. Together, the essays inaugurate the productive syntheses that become from mapping the philosophy of Deleuze and Guattari in proximity to contemporary ecological concerns.

Deleuze/Guattari and Ecology incorporates a broad array of perspectives that divide fairly equally between the sciences and the arts; indeed, one could categorise the essays along these two predominate lines. Yet Herzogenrath chooses not to divide any of the essays into thematic groups and his sequencing of the volume appears to be without a governing agenda. That said, I believe this (dis)organisational scheme reinforces the various 'eco*logics*' theorised by the contributing authors and makes the collection especially suitable for non-linear or affective

readings, which Deleuze himself promoted in texts such as *A Thousand Plateaus* (Deleuze and Guattari 1987) and *Spinoza: Practical Philosophy* (Deleuze 1998). In this way, the collection enacts Manuel DeLanda and Roland Bogue's ideas on ecosystems: it is extremely complex and demands that one be knowledgeable in (or at least willing to engage with) a cacophony of disparate fields, and it plays host to a multitude of open-ended, autopoietic becomings and transversal encounters between authors whose diverse foci produce many innovative connections between Deleuze and Guattari, science and art, environmentalism and ecology.

In the volume's opening essay entitled 'Ecology and Realist Ontology', Manuel DeLanda attempts to rethink realist ontology so that, among other things, we can properly understand the immense complexity involved with ecosystems. While DeLanda claims that (a combination of) scientific fields are better equipped to study ecosystems than semiotics or hermeneutics, he insists that philosophy must fill a number of vital vacancies neglected by scientists, many of whom are over-specialised positivists concerned only with 'directly observable entities' and with predicting or controlling the phenomena in question (23). He contends that our understanding of ecological processes must treat 'entities like hydrogen atoms or electrons … every bit as real as large animals and plants' and 'grant reality full autonomy from the human mind', but such ontology must avoid the naïve essentialism that has previously turned intellectuals against realism (24). This Deleuze-inspired 'reconstruction' of realism, following modern evolution theory, starts by substituting 'an open-ended becoming based on individual and universal singularities' for the 'static and closed' categories associated with the classification system of *general* essence and *particular* instance (40). What is ultimately at stake here, according to DeLanda, is the proposition that *individuation processes* are responsible for the 'identity of each individual entity' and that one must then look to 'immanent (nontranscendent) abstract structure[s]' for an account of 'any regularities in the [individuation] processes themselves' (27). A more nuanced grasp of this proposition would require ventures into DeLanda's lengthy interpretations of Deleuze's use of the terms 'intensive' and 'virtual'. Suffice it to say, in terms of its impact on ecological thought, DeLanda's essay affords a substantial, hard-earned confidence boost to those who have posited or hypothesised an intuitive significance to unconventional ecological phenomena in spite of the intellectual haziness that, as he suggests, inevitably stigmatises traditional ontological commitments rooted in idealism and positivism.

By situating Deleuze and Guattari's ideas about the mechanosphere with reference to recent technological advancements, Luciana Parisi's 'Technoecologies of Sensation' helps us cope with and unpack the dense writing found in, for example, the Guattari of *Chaosmosis* (1995) (especially the chapters 'Machinic Heterogeneities' and 'Schizoanalytic Metamodelisation'). Important to her argument is Guattari's assertion that machines, in contrast to structures, are self-organising processes and should therefore be regarded as a prerequisite for technology rather than its subset or expression (Guattari 1995: 33). Working from the premise that 'changes in technical machines are inseparable from changes in the material, cognitive, and affective capacities of a body', Parisi sets out to examine how the 'bionic tendencies of new media technologies' leads to changes in sensation or modes of feeling (182). Beyond the taxonomy of form and content, Parisi conceives of new media technologies as 'technoecologies of sensation' that usher in domains of sensation marked by an unprecedented contact with virtual forces. Thus, not only is sensory-motor perception extended, but technologies such as biochips become linked to what Parisi calls 'symbiosensation: the felt experience of a nonsensuous relatedness between organic and inorganic matter, adding on a new gradient of feeling in the thinking-flesh' (192). If, as Deleuze insisted, the cinema presents a challenge to thinking, then Parisi's analysis of digital media architecture drives towards a related insight: bionic technologies evoke emergent nexuses between 'organic and inorganic milieus of information sensing' that 'engender an extended proprioceptive sensation whereby movement or spatiotemporal orientations have become ecological' (193). Scholars with a broader interest in this line of inquiry should consult the work of Gregory Ulmer, whose theory of electracy addresses the implications of digital media from a poststructuralist, often Deleuzian perspective. 'Technoecologies of Sensation', although environmentalists would likely overlook it, constitutes a difficult expedition into the 'more vague yet more real' ecological phenomena that become accessible when we think beyond standard categories and subsets, as proposed by DeLanda earlier in the collection. (It is helpful to read DeLanda and Parisi together.) Both authors write in the spirit of Deleuze in *Spinoza: Practical Philosophy*, building on his preference for thought over consciousness in a quest to 'acquire knowledge of the power of the body in order to discover, *in a parallel fashion*, the powers of the mind that elude consciousness' (Deleuze 1998: 18).

Scholars of literary and cultural studies who work on globalisation issues will undoubtedly find value in the Guattari-oriented essays

by Jonathan Maskit and Verena Adermatt Colony. For Maskit, globalisation or integrated world capitalism names a nightmare of homogeneity in which mass-media circulate a dominant subjectivity that 'produce[s] desires and pleasures that are concordant with the products and services that can be provided through the marketplace' (138). Maskit's discussion of the problem of consumption penetrates right to the core of integrated world capitalism. There is much more to our desire for commodities than a sterile, rationalist approach would like to admit, and Maskit admirably complicates the issue beyond the reductive work in environmental philosophy that he criticises. Rather than attempting to control consumer desire and waste in a moralising fashion, Maskit essentially calls for what Guattari terms a 'value-system revolution', whereby a (processual) resingularising subjectivity generates new values that make an ecological mode of living achievable by *affirmation* (as opposed to negation and lack). Although the recommended practices listed in the conclusion of Maskit's essay would have benefited from engagements with Deleuze and/or Guattari beyond just *The Three Ecologies* (2008), Maskit lays the groundwork for others to pick up where he leaves off by using their philosophy for the reshaping of subjectivity, in addition to critiquing capitalist subjectivity. Guattari would not be satisfied by the current omnipresence of 'green' lists prescribing to readers how they should live and what they should or should not buy in order to be eco-friendly. Maskit is then right to qualify contemporary ecological concerns as opportunities for 'a rethinking of what it means to be human', but this realisation will be of little consequence if, in the end, we fail to generate the transversal tools necessary to facilitate such a rethinking (140). Guattari's later writings on the shift from mass-media culture to what he calls a *post-media age* seem especially relevant here, if we are to truly 'move in the direction of co-management in the production of subjectivity' (Guattari 1995: 12).

Conley's essay 'Artists or "Little Soldiers?" Felix Guattari's Ecological Paradigms' has much to say in relation to Maskit's. After Conley spends much of the first half paraphrasing and elaborating on passages from *The Three Ecologies*, the essay takes on new life as it moves to examine the potential for 'affirmative creative resistance' that builds as advances with the internet provide more and more people a venue to publicise cultural work (123). If we accept Maskit's proposition to rethink subjectivity in the light of environmental crisis, then Conley's piece asserts 'the importance of singular and collective enunciation as a performance' integral to processes of resingularisation (124). In other words, acts of creativity (including 'new forms of militantism') are

central to the nascent subjectivity that Guattari prioritises at the end of *The Three Ecologies* (126). Furthermore, Conley does a remarkable job of constructing an exciting dialogue between poststructuralist theory and current events, as does John Protevi in a brilliant and far-reaching essay on Hurricane Katrina, wherein Protevi performs an astonishing amount of historical research to tease out an urgent 'political lesson' about government and solidarity (180).

What alternatives can we turn when surrounded by that all too human face of the integrated world capitalism denounced here? Essays by Herzogenrath, Halsey, Abrioux, Fuller and Zepke each speak to the belief, paramount to Deleuze and Guattari, that the 'non-human pre-personal part of subjectivity is crucial since it is from this that its heterogenesis can develop' (Guattari 1995). These five essays, which traverse an impressive blend of ethological and aesthetic objects, are perhaps best read in the context of Gary Genosko's essay on subjectivity and art. According to Genosko's extensive treatment of Guattari's later texts, art should always be of interest to those concerned with ecological or environmental problems – including creative works that do not explicitly valorise trees, flowers, prairie dogs and so on. Heterogeneous exploration of the refrains of subjectivity, the conditions of its production, is what conjugates the arts with a generalised ecology. Genosko successfully emphasises the 'esthetic dimension of eco-praxis' and shows how 'ecosophic activism "resembles" the work of artists' (110). Herzogenrath's essay searches for relations between nature and music that extend beyond representation. Thus, rather than the routine ecocritical study of how nature is depicted in selected works, Herzogenrath boldly asks: can weather itself be music, and can music itself be meteorological? Through a comparative analysis of three composers (Ives, Cage, Adams), via a surprising mix of Deleuze and Thoreau, Herzogenrath puts us in an excellent position to appreciate the full significance of John Luther Adams's claim: 'As we listen carefully to noise, the whole world becomes music' (228). While each of the authors mentioned above contribute innovative readings of 'off-beat' genres ('Intensive Landscaping' and 'Art for Animals' are prime examples), Herzogenrath's originality is the most poignant.

Essays by Roland Bogue and Hanjo Berressem shift the focus away from Guattari's explicit ecosophy and redirect our attention to ecological leanings of the collaborative works, namely both volumes of *Capitalism and Schizophrenia*. This move seems very pertinent given Deleuze's claim in the late 1980s that he and Guattari wanted to write a (last) book on their philosophy of Nature. Bogue's essay 'A Thousand Ecologies'

seeks to discern what this (eco)philosophy might have looked like, while Berressem stages an epic interrogation of key concepts (e.g. autopoiesis and structural coupling) Deleuze adapted from systems theory and second-order cybernetics, ultimately showcasing the influence of Deleuze's 'radical philosophy' on Guattari's 'radical ecology' (57). Indeed, both essays prove that Deleuze and Guattari's thought is quite applicable and enriching to ecological discourse, 'especially given their opposition to any definitive separation of the social, cultural, and technological world of humans from the non human world' (50). Finally, in the pivotal moment of Bogue's essay (arguably the book's most important moment), the question of philosophy's readiness to help us through ecological crisis doubles back on itself: what does philosophy stand to lose in an era of environmental degradation and endangered species? Bogue's answer is subtle, distinctive, and chilling:

> Modes of existence that destroy habitats, induce pandemics, or foster pathogenic disequilibrium inhibit a creative exploration of the possibilities of bodies and decrease the options for a reconfiguration of humans and the earth. The fewer the life forms available for becoming-other, the fewer the trajectories available for creative transformation. (54)

It should be noted that the sheer breadth of concepts mobilised in this collection renders it useful to a wide range of Deleuze scholars, but less so to ecologists who have never read Deleuze and/or Guattari (although the book could function as an inspiring point of departure to guide such readers). With the growing, international interest that now more than ever surrounds questions of environment and ecology, both established Deleuze and/or Guattari scholars, and younger ones first encountering their work, are signalling an ecological turn that, ten years ago, was all but absent from studies of these two landmark thinkers. Of this recent publication trend, Maskit writes, 'there has been a slow trickle that is, perhaps, ready to become a stream' (131). If it becomes a stream, expect Herzogenrath's collection to be cited many times along the way.

Deleuze and the Symptom: On the Practice and Paradox of Health

Aidan Tynan Cardiff University

The concepts of health, illness and medicine are a persistent and recurring concern in Deleuze's work, yet the secondary literature shows only a scant interest in the topic, with Daniel W. Smith's excellent introduction to his English translation of *Essays Critical and Clinical* (Deleuze 1997) remaining one of the few sustained pieces of commentary on this aspect of Deleuze's thought. The reasons for this very possibly have to do with the complexities of Deleuze's own intellectual peregrinations. In an interview given in 1967, following the publication of his book on Leopold von Sacher-Masoch, Deleuze stated his plans to write a series of works on literary authors in order to 'articulate a relation between literature and clinical psychology' on the basis of the symptomatological method he had discovered in Nietzsche (Deleuze 2004a: 133). If these books were never written, with the pieces collected in *Essays Critical and Clinical* our only real clues as to what they might have looked like, it is no doubt because after May '68 and the meeting with Guattari the importance of generating a 'universal clinical theory' took on a different and renewed impetus (Deleuze and Guattari 1988: 311). There is a certain divergence, then, in Deleuze's conception of the clinical which remains to be clarified. If, in the symptomatological register, the symptom is diagnostic, relating to the creation of new clinical entities, in the schizoanalytical mode it is therapeutic, an injunction to produce. As Deleuze put it, 'you *must* produce the unconscious. Produce it, or be happy with your symptoms, your ego, and your psychoanalyst' (Deleuze 2006: 81).

And yet, there is an undeniable continuity linking these two periods in Deleuze's thought. It is the fact that health always implies a *practice* that links the different clinical theories of symptomatology and

www.eupjournals.com/dls

schizoanalysis. When asked in an interview in 1988 about the role of literature in his work, Deleuze reflected on his incomplete critical and clinical project, insisting that his favourite authors, Masoch, Proust and Kafka, were all in their own way diagnosticians. But, he added: 'It's not just a matter of diagnosis. Signs imply ways of living, possibilities of existence, they're the symptoms of life gushing forth or draining away' (Deleuze 1995: 143). Art and politics are inextricable, in this sense, from a commitment to the practice of living, and any such practice must involve some conception of health. As Deleuze stated in 1968 with respect to *Difference and Repetition* but foreshadowing his future collaborations with Guattari, 'we're looking for 'vitality' in the patient, which the patient has lost, but which the analyst has lost, too. Philosophical vitality is not far off, nor is political vitality' (Deleuze 2004a: 142).

But the question remains: how are we to understand this vitality, this health to come which 'is not far off'? We need to return to the roots of the concept in Nietzsche who remarked on his own practice of 'inverting perspectives', of 'looking from the perspective of the sick towards *healthier* concepts and values, and conversely looking down from the fullness and self-assuredness of *rich* life into the *décadence* instinct' (Nietzsche 2007: 8). As Deleuze observed, it was this ability, this critical mobility, to shift between the two perspectives which, for Nietzsche, constituted 'great health': 'There is no reciprocity between the two points of view, the two evaluations. Thus, movement from health to sickness, from sickness to health, if only as an idea, this very mobility is the sign of superior health' (Deleuze 2001: 58). This understanding of health as a pure becoming implies no static opposition of sick and healthy but rather a *paradox* similar to the one Deleuze describes in the first series of *The Logic of Sense* with respect to Alice's becoming larger and smaller: 'paradox is the affirmation of both senses or directions at the same time' (Deleuze 2004b: 3). Health, then, understood in the Deleuzian sense, is an affirmative – which is to say both productive and unresolvable – paradox which orients us towards health and sickness, life *and* death, at once, towards a new vitality but also towards new dangers and impasses. In their very different ways, the contributions gathered together in this issue of *Deleuze Studies* pursue this paradox through a multitude of practices and explore how Deleuze's deep interest in clinical phenomena collides with philosophy, art, politics and morality. Each contribution engages deeply with the paradoxical nature of Deleuzian health and with the implications it has for a variety of fields and contexts.

Sarah Mann-O'Donnell's article thoughtfully reconsiders the vital continuum linking Nietzsche with Deleuze and Guattari via the theme of 'great health', and thus provides a perfect starting point for this issue. Health, for Nietzsche as for Deleuze and Guattari, is not to be understood in opposition to illness but as the immanent process whereby illness brings about its own autocritique and self-overcoming. True health can only take the form of a continuous revaluation of illness. It was the very problem of creating a critical concept of health, without succumbing to a static or hierarchical opposition, that inspired much of Nietzsche's critical practice. As Mann-O'Donnell argues, Nietzsche was 'terrified of repeating Socrates' error of choosing a cure for a sick age that only contributes to the sickness' and so instead took the radical step of positing the immanence of sickness and health in which critique would necessarily be a synthesis of patient and doctor, poison and antidote. Indeed, Deleuze recognised this when he wrote of Nietzsche's engagement with nihilism in terms not of opposition but of completion: Nietzschean revaluation pushes nihilism to the point where it is transmuted, 'defeated by itself', 'as if completed nihilism gave way to its opposite' (Deleuze 1997: 102). Thus, Mann-O'Donnell understands the paradox of health as the paradox of difference in itself, of the difference that differs only from itself: 'the organism must become ill before it can become healthi*er*, because falling ill makes those who can survive healthier. And yet *ill* is only a degree of *healthy*'.

Schizoanalysis can be understood as an even further radicalisation of Nietzsche's valetudinary concerns in that it extends the practice of health to include the controlled demolition of the organism. Mann-O'Donnell presents schizoanalysis as a therapy in which what we are cured of is the personological ideal informing oedipal psychoanalysis. In order to be cured of the oedipal cure in this way we do indeed risk our very personhood, and the abyss of schizophrenic breakdown is ever present. But health is always a means to find new ways, whether political, moral or aesthetic, of living the extremes of illness. These are the paradoxical terms by which Mann-O'Donnell exhorts us to read Deleuze and Guattari's sixth plateau, entitled 'How Do You Make Yourself a Body Without Organs?'. The language of caution infusing much of *A Thousand Plateaus* is strongly in evidence here, as the authors warn against the proliferation of empty, cancerous and hypochondriac BwOs (Deleuze and Guattari 1988: 163). The art of experimentation Deleuze and Guattari describe involves us holding on to just enough of the organism so that we can continue our campaign of creative destruction against it. The critical concept of health, then, in both Nietzsche

and Deleuze and Guattari, implies an 'art of dosages', which Mann-O'Donnell describes in terms of 'autoimmune self-immunisation' by which we prescribe to ourselves just enough of the toxins of organisation and stratification to be able to take our experiments that bit further.

The practice of health requires us to think critique as a lived process, and thus to rethink the relation between bodies and signs. This was one of the main motivations behind Deleuze's synthesis of literary criticism and clinical diagnosis. Erika Gaudlitz presents Deleuze's 'critical-clinical hypothesis' within the domain of literary symptomatology, in which the author engages with bodily affects and linguistic signs through the exemplarity of specific symptoms. In Gaudlitz's analysis, this approach to the creative process is necessarily a liminal one since its focus is neither on the materiality of the sensuous body nor the immateriality of the signs which render meaning, but on a space in which sign and body are at once material and supersensual, mutually implicated in a space Deleuze calls 'body-language'. Deleuze's conception of literary style cannot be distinguished from his 'wild empiricism' which, as Gaudlitz suggests, discerns within language the exemplary signs of a bodily *pathos*: 'stuttering, vibrating, trembling evoke the gaps through which affects break forth, often underlined by the rhythms of breathing'. But style here does not simply diagnose a state of pathological breakdown, it also, crucially, bears witness to the possibility of new means of expression, new ways of living. Beckett's works seek out the 'unsayable' or non-verbal within language, the outside of language, a language of gesture. Beckett's style, then, is also, in some sense, a non-style, pointing beyond any aesthetic unity or formal integration in order to connect to an outside which is the political domain of desiring-production.

The amnesia, abulia and compulsions which wrack the bodies of Beckett's characters testify to states of bodily exhaustion and weakness, but it is only through this weakness that anything strong or vital can break through. For Deleuze, the body can only be thought in terms of this fundamental paradox informing the '*pathos*' of the creative process. The critical-clinical approach takes its inspiration from Artaud who tells us, as Deleuze and Guattari write, 'that thought operates on the basis of a central breakdown, that it lives solely by its own incapacity to take on form' (Deleuze and Guattari 1988: 378). It is this struggle against language and form, understood in their petrified, conventional sense, which holds out the hope for aesthetic and political rejuvenation. Gaudlitz's analysis of Deleuze's reading of Beckett posits the evolution of Beckett's works, from his early novels to *Worstward Ho*, as the stages of a becoming which follows the path of a schizophrenic disarticulation

of our present forms of life and language, of the exhaustion of names and the voices which speak them, towards a language of pure images and any-spaces-whatsoever. Gaudlitz concludes that the ultimate destination of Beckett's art is a language proper to the body without organs, the great recording surface for the universal and world-historical productions of desire.

Andrew Robinson brings Deleuze and Guattari into a fruitful confrontation with Žižekian political theory through the concept of the 'social symptom'. Žižek's infamous and pungent blend of Lacanian psychoanalysis and Hegelian logic posits the expulsion from the social field of a constitutive element – what Lacan defined in terms of the psychic 'real' – which subsequently functions as a structuring principle of politico-ideological subjectivity but which nevertheless remains necessarily excluded or lacking from it. The symptomatic return of the excluded, then, is capable of forming the basis of a revolutionary politics, as Žižek's work argues. Robinson, however, aims to disengage the concept of the social symptom from what he describes as a methodological and theoretical conservatism that mires it in dialectical and psychoanalytic theories of the negative in order to elaborate the possibility of 'an affirmative politics of the excluded'.

Žižek uses the Lacanian clinical structure of neurosis to conceive of the paradoxical position whereby one faces what is most real and authentic, and hence revolutionary, in social life only through a subjective identification with the symptomatic return to consciousness of what was, in the process of subject formation, violently expelled from it. But this means that Žižek remains, in an important sense, frozen between the poles of a constitutive and innate neurotic maladjustment on the one hand, and a conservative and oedipal psychotherapeutic individualism on the other, which, as Deleuze and Guattari were the first to point out, constitute the very ideological 'trap' of capitalism. The paradox Žižek invokes, then, cannot ramify along the rhizomatic and productive lines by which Deleuze and Guattari envisage the Lacanian real, and simply reproduces in theoretical discourse the ideological capture by which capitalism contains the revolutionary potential of desire. The Deleuzian correction of Žižekianism allows Robinson to make a forceful argument for a political alliance with a broad sweep of excluded, precarious and minoritarian groupings and peoples which resist, via multifarious forms of networked self-organisation, the ideological capture manufactured by the dominant gaze. The poles of constitutive neurosis and oedipal therapy which stymie psychoanalytic discourse are replaced in schizoanalysis by the poles of capture and escape. The

revolutionary task, then, is not to identify with something dominant that consciousness must, for the sake of its own integrity, refuse to recognise, but to embody through our desires and our becomings the emergence of something absolutely different in itself. The result would be, as Robinson concludes, a symptomless society in which everyone is a symptom.

Lorna Collins's contribution engages provocatively and, sometimes, critically with Deleuze's use of pathology as an animating principle of thought. The schizoanalytic project, Collins suggests, poses the question 'how much subjectivity is enough to hold together the particular individual that we are, but not too much to curtail the continuous flux of our identity?' The paradox here, once again, is that one needs an organism and a subjectivity in order to continue the process of creative destruction waged against them. How can one experience schizophrenia or anorexia without falling ill, or alcohol and drugs without becoming addicted? Collins foregrounds the practical and therapeutic impetus behind these questions, in that what she calls an aesthetic and moral 'restorative sense' can emerge from them. The language of caution and prudent experimentation which characterises *A Thousand Plateaus* must be read in the light of *The Logic of Sense* which, Collins argues, following James Williams, gives us a 'moral philosophy' capable of guiding us through the often violent reorientation of thought which Deleuze and Guattari bring about.

Illness presents an eminently *moral* problem which, while being physical and psychological with very real and often debilitating effects, is also thoroughly philosophical in its import. Every encounter with a body which threatens the stability and integrity of my self or which wounds my body, gives me the possibility to think and feel anew. But the properly philosophical, and also, therefore, moral crux of the matter, for Deleuze, is how to extract from such an encounter that part of it which remains the virtual component of the actual suffering caused. This is not to prize, out of an intellectual preference, the virtual over the actual, as some opponents of Deleuze have argued. On the contrary, it means a direct engagement with those processes of actualisation which block and inhibit us and which, in the worst cases, force us into the abyss of pathology. This is why Collins emphasises the importance of counter-actualisation: the point is not to avoid the actual in favour the virtual, but to *repeat* the actual so as to discover in it that which counters its damaging effects. This amounts to a practical engagement with the real, and not a retreat from it, through the restorative effects of art and creativity. Collins gives as examples the works of Joe Bousquet and F. Scott Fitzgerald, and goes on to discuss the *art brut* of figures

such as Adolf Wölfli, and role of the politically engaged theatre of Augusto Boal in relation to a Deleuzian conception of art therapy. As Collins convincingly and insightfully argues, the schizoanalytic project, especially as this is read through Guattari's conception of an 'ethico-aesthetic paradigm', shares profound links with the therapeutic conception of the value and function of art in society.

Simon O'Sullivan's article takes up where Collins finishes off and provides an incisive look at Guattari's notion of 'schizoanalytic metamodelisation' in *Chaosmosis*, framing the latter's work, alongside that of Badiou, as challenging the Kantian transcendental 'bar' separating the finite and the infinite in the subject-object relation. Instead of presupposing the opposition of subject and object, finite and infinite, O'Sullivan argues instead for a 'continuum of sorts' allowing for the folding of the one into the other. Guattari's ontology of the infinite gives rise to a politically therapeutic autopoiesis, 'the instalment of *local* coding or singular points of organisation' within the structures of overcoding and hierarchisation characteristic of the capitalist assemblage and the modes of subjection operant in it: '[for] Guattari it is this 'folding-in' of the outside – by the subject on his or her own terms – that constitutes a freedom of sorts from subjection. It is, as it were, a certain intention and orientation that will also involve a programme'. This programme, both therapeutic and aesthetic while also being thoroughly politically engaged, has links to the later Foucault's work on the autoproduction of subjectivity and refutes the aporetic melancholia implied by the split subject of Lacanian discourse.

For Guattari, psychosis and not neurosis provides the therapeutic model for moving beyond the capitalist assemblage. Psychosis here is not just an illness, but the point at which all the models by which subjectivity is produced and reproduced in daily life break down; it thus represents the crucial point at which the modes supporting consensual social reality can be immanently transvalued – hence, the metamodel of schizoanalysis. Here we touch upon the importance, which runs throughout Deleuze and Guattari's work, of schizophrenia as *both* the ultimate catastrophe, the terminal breakdown, *and* the decisive breakthrough. Thus, the symptom, as so many schizophrenic refrains or narratives flooding our petrified consensual models, is, as O'Sullivan puts it, 'a precursor of an unconscious that is yet to come'. The machinic and the symptomatic unconscious can join forces. It is precisely through the subjective autopoiesis of the symptom that the chaos threatening to deluge us with pathology becomes workable and susceptible to asignifying narration and diagrammatic mapping. Guattari's concept of

the aesthetic, then, aims to free aesthesis from its petrification within established artistic models in order to put processes of creativity into contact with everyday experience.

My brief and necessarily imperfect summary of the articles gathered here will hopefully spur the reader on to engage with them directly and to form his or her own opinions. These pieces cover an important but neglected area in the field of Deleuze studies, and go some way towards ameliorating that neglect. But beyond the field of Deleuze studies *per se* each of the contributions also demonstrates how the clinical theories proposed by Deleuze and Guattari – in different forms, both alone and in collaboration – can be of great relevance to a number of fields both inside and outside the academy. It is hoped that this issue will encourage literary theorists, philosophers, social scientists, clinicians, artists and others to explore the pathological, diagnostic and therapeutic dimensions which Deleuze and Guattari brought to bear on the problems of suffering, creativity and freedom.

From Hypochondria to Convalescence: Health as Chronic Critique in Nietzsche, Deleuze and Guattari

Sarah Mann-O'Donnell Northwestern University

Abstract

In 1886, Nietzsche wrote: 'I am still waiting for a philosophical doctor in the extraordinary sense of the term': a doctor who pursues not truth, but an exceptional kind of health. Nietzsche's will to health, his theory of drive organisation, and his insistence that the philosopher put himself at risk, all work together in his overall project, which consists of taking up the very role of the highly revalued physician for whom he is waiting. Deleuze and Guattari engage this same task of a revalued doctoring in the *Capitalisme et Schizophrénie* books, attacking the disease of oedipality and providing instructions for the deorganisation of the organism as self-cure. Offering tips on this radical treatment, they employ the figure of the hypochondriac to show how it can fail. Both Nietzsche and Deleuze and Guattari perform a revaluation of health as a condition of chronic critique, a condition that wraps itself around illness to keep itself critical.

Keywords: Nietzsche, sickness, illness, convalescence, BwO, nihilism, hypochondria, health, revaluation, critique, Oedipus, vivisection, autoimmunity, dose, patient, doctor, physician

> . . . not to 'truth,' but to *something else*, let us say to health. . . [1]

The condition of the patient is critical, and as such, is patient . . . and waits. Hence Nietzsche: 'I am still waiting for a philosophical doctor in the extraordinary sense of the term': a doctor who pursues not truth, but

Deleuze Studies 4.2 (2010): 161–182

www.eupjournals.com/dls

an exceptional kind of health (Nietzsche 1886a: 2). The journey towards this 'great health' is presented in the narrative of convalescence that forms the preface to his *Menschliches, Allzumenschliches*. The preface functions like a prism to show how Nietzsche's will to health, his theory of drive organisation, and his insistence on the job of the philosopher to put himself at risk, all work together in his overall project, which, as we will see, consists of taking up the very role of the highly revalued physician for whom he is waiting. Enter Nietzsche as self-vivisectionist: as a patient doctor for health's critical condition. Deleuze and Guattari engage this same task of a revalued, patient doctoring in the *Capitalisme et Schizophrénie* books, attacking the disease of oedipality and providing instructions for the deorganisation of the organism as self-cure in the chapter, 'Comment se faire un Corps sans Organes'. Offering tips on this radical treatment, they employ the figure of the hypochondriac to show how it can fail. Both Nietzsche's preface and Deleuze and Guattari's chapter describe a radical practice for living and thinking, and both perform, in the context of their respective authors' *corporum*, a revaluation of health as a condition of chronic critique, a condition that wraps itself around illness to keep itself critical. If Nietzsche constitutes, as David Farrell Krell suggests, a 'carrier' (Krell 1996: xiii), Deleuze and Guattari show, above all in the 'Corps sans Organes' chapter, that they have successfully caught his infection. What Nietzsche carries, his tenacious will to critical health, has managed to survive the sickly drive interpretation that is Oedipus, infecting the *Capitalisme et Schizophrénie* books as a contemporary cure for the cure.

I. The Philosophical Physician as Convalescent: Health as Chronic Critique

> . . . healthy, which is to say, healthi*er*. . . [2]

The act of reading Nietzsche's *Menschliches* preface itself requires a bit of prefacing. Framing the preface in terms of Nietzsche's own self-framing in the *Versuch einer Selbstkritik* grants a preliminary sense of how convalescence functions as a mode of critique in his work. In the opening lines of the *Selbstkritik*, Nietzsche frames the origin of *Die Geburt der Tragödie*, the first published work, in terms of an illness brought home from the field (Nietzsche 1886b: 1).[3] Already in this act of framing, Nietzsche begins to rewrite the notion of origin, to critique it, by associating it with illness. As Foucault suggests, Nietzsche here, as

elsewhere, teaches us to question and to laugh at the assumed solemnity of origin, at that origin that precedes the 'Fall', the body and time (Foucault 2000 [1971]: 372). In the *Selbstkritik*, illness quickly infects origin, budges it from its place, constituting beginning instead as an always-already constitutive Fall – not a Fall *from*, but a beginning Fall. This Fall occurs, in time, in the body, as strife; as a beginning infection that constitutes Nietzsche's 'difference in the origin'.[4] We begin already in the fall, we *are* falling (ill).

Nietzsche further frames the origin of the *Geburt* not just in terms of illness, but in terms of his *Genesung*, his convalescence.[5] As the theory of drives represented in the 1888 *Nachlaß* fragments clearly shows, any healthy organism, for Nietzsche, seeks strife and struggle by entangling itself with sickness, in order to overcome, in accordance with the will to power (Nietzsche 1968: 656). A healthy organism's constant reworking, its constant self-overcoming, bridges the constitutive state of falling ill and the state we fight for as we overcome a given disparity.[6] This requirement of difference – of hierarchy in which one force dominates another but only ever tenuously – replaces any kind of origin for Nietzsche. This flickering continuum of convalescence between illness and a not yet arrived at health manifests as becoming in Nietzsche, and it is instrumental in his revaluation, in the *Menschliches* preface, of all three terms.

As prefacing self-criticism, this *Selbst-kritik* offers a window onto Nietzsche's patient convalescence *as physician*: he ministers to himself, the patient philosopher, as a doctor, preparing the body of the former while practising the role of the latter, performing what Daniel Ahern calls his self-vivisection (Ahern 1995: 161). 'I am waiting', he tells us, 'for a philosophical physician'; and in this context we can already see a certain commitment to non-arrival as we envision him waiting for *himself*. With his 'future-seeing night goggles', to borrow a phrase from Avital Ronell, Nietzsche waits for himself as he self-vivisects (Ronell 2005: 6). His commitment to an *active* convalescence as process produces an eternal wait to match a perpetual fall, resulting, as we will see, in a chronic self-critique that catches itself only in order to self-overcome.

In an intensification of the play between illness and convalescence that Nietzsche offers in the *Selbstkritik*, the structure of the *Menschliches* preface interlaces five figures of illness, each of which contribute to his revaluation of health. To demonstrate the process through which one must go to achieve this 'great health' (Nietzsche 1887: 2 : 24), he articulates first, the sickness of extreme nihilism; second, the

convalescence from that nihilism; third, that sickness revalued as cure; fourth, the diseases that this revalued sickness cures; and finally a fifth revalued health that embraces self-difference as intensive and chronic convalescence. Working through these figures one by one will clarify Nietzsche's practice of self-vivisection, already articulated in relation to the *Selbstkritik*, as crucial to his revalued health as chronic critique.

In the *Menschliches* preface, Nietzsche immediately articulates the 'infected (*Behafteten*)' status that results from his own 'unconditional disparity (*Verschiedenheit*) of view' (Nietzsche 1886c: 1). Let us pause, first, to consider the nature of this sickness in disparity. Sometime between 1887–88, Nietzsche calls himself 'the first perfect nihilist of Europe who, however, has even now lived through the whole of nihilism, to the end, leaving it behind, outside himself' (Nietzsche 1968, preface: 3). Having judged nihilism the disease of his era, his having lived through it renders his view quite disparate – he is utterly alone, different – different, crucially, from his closest enemy, Socrates, who, like Nietzsche, treated his culture as a philosophical physician, but unlike him, was unaware of his own infection, and therefore unaware that his treatment was just another part of the problem (Nietzsche 1875: 1). Terrified of repeating Socrates' error of choosing a cure for a sick age that only contributes to the sickness,[7] Nietzsche develops the visceral patience required of him in the form of a special discipline, a *Selbstdisziplin*: 'to take sides against everything sick in me' (Nietzsche 1888: *Vorwort*).[8] Thus his *Verschiedenheit* results from his survival of nihilism, attained through self-vivisection; but this state of self-vivisection does not cease, once he has healed himself. Instead, Nietzsche's *Verschiedenheit* further consists, as the preface will show us, in a keeping-himself-open, open to continued suspicion, and to the *Verschiedenheit* of illness that is so essential to the health of the Nietzschean organism as it self-overcomes in the movement of will to power. Thus Nietzsche's infection with nihilism is not the infected status to which he refers in this opening phrase – even if he has excised every trace of nihilistic infection, *this* infection of which he speaks is the result of the need to keep illness constantly alive, to keep himself open to it, so that he can maintain a conscious, ever-strengthening health.

This second infection is elaborated in the remainder of the preface, where he describes the process through which one must go to attain his status, by describing the companion spirits he imagines will one day form a community of thought for him, in other words, a community that will dissolve his *Verschiedenheit*, in the first sense articulated above (Nietzsche 1886c: 1). He describes the path one would have to take to

gain a *verschiedene* view comparable to that of his own, beginning with a violent unfettering from everything the person knows and holds dear (Nietzsche 1886c: 3). This convulsive tearing away from a normative set of beliefs and values gives way to a state of morbid, isolated wandering, in which the person attempts to evaluate the world on her own account through a 'wild' method of questioning, unveiling, reversal and experimentation (Nietzsche 1886c: 3). In his description of the spirit-in-becoming's most extreme questions, Nietzsche clearly identifies this sickness as flaunting the most desperate symptoms of nihilism as the historical phenomenon in which 'the highest values devaluate themselves' (Nietzsche 1968: 2): the invalid asks, 'Can *all* values not be reversed?... and [is] God only an invention and finesse of the Devil? Is everything perhaps in the last resort false? And if we are deceived, are we not for that very reason also deceivers? *must* we not be deceivers?' (Nietzsche 1886c: 3). In these questions, the current values of God, Truth, the Good, etc., are seen as deceptions, and as a result we gain a terrifying vision of meaninglessness in which we can find nothing worth living or dying for. And since, as he writes in the epilogue to *Der Fall Wagner*, we all have unconsciously, involuntarily in our bodies, values of decadent descent, 'we are, physiologically considered, *false* [*physiologisch betrachtet*, falsch]' (Nietzsche 1888: *Epilog*). The complete collapse of these values, our instinctive preference for what we can now recognise as false, renders us nearly incapable of avoiding our own demise (Nietzsche 1968: 5).[9] Enraged by the fact of ourselves as physiological antinomies, we thus become destroyers of anything resembling the devaluating truths (Nietzsche 1968: 24).

In the preface, Nietzsche calls this process of destructive inquiry of any meaning the world could hold an illness that can destroy the man who has caught it: 'how much illness is expressed in the wild experiments (*Versuchen*) and singularities (*Seltsamkeiten*) through which the liberated prisoner now attempts to demonstrate his mastery over things!' (Nietzsche 1886c: 3). Driving the person's 'toiling and weaving' is what Nietzsche calls 'the question mark of a more and more perilous curiosity'. This sickness of the emerging free spirit is intimately entangled with her 'vehement, dangerous curiosity for an undiscovered world' (Nietzsche 1886c: 3). I want to identify this extreme end of nihilism, the destructive compulsion to question, as the *first manifestation of illness* in Nietzsche's narrative (we will return to his infection as continual self-vivisection as a later manifestation, considering the preface as a narrative of convalescence). The figure of the question mark vibrates, in this part of the narrative, as a source of potential harm for the

organism herself – the increasing disorganisation of drives that occurs as all illusions are destroyed is haunted by imminent death. A 'threatening, suffocating, heart-tightening' isolation comes into play as the spirit's curiosity leads her 'on, even further away, even further down' (Nietzsche 1886c: 3). The process of self-risk, then, is inherent in this downward-spiralling, nihilistic practice of curiosity, enacted through *Versuchen* and *Seltsamkeit*, which Nietzsche labels 'sick'. He articulates this touchy space, the space of 'questionable questioners', between completely destructive questioning and productively destructive questioning, one year later in the *Genealogie*:

> We have no doubt today that sickness is instructive, much more instructive than health, and [we] seem to require contaminating people even more than we do medicine men or saviours. We violate ourselves, nutcrackers of the soul, questionable questioners, as though life were nothing but a cracking of nuts. Does this not make us every day more questionable but also more worth questioning, perhaps more worthy to be alive? (Nietzsche 1887: 3 : 9)

Here he frames his tenet that illness is necessary to life in terms of the necessity of the dangerous question: illness is a constant threat, a built-in resistance with which the organism must continue to engage, or else it begins to degenerate, which is what has happened in the utter desperation of nihilism.[10] As resistance, illness, we find in another 1888 fragment, 'restores energy to the slack fibers and toughness to the will to live' (Nietzsche 1968: 912). Only the most innovative of questionable questioners will be worthy of life, will survive; thus as early as 1885: 'That of which more delicate men would perish belongs to the stimulants of *great* health' (Nietzsche 1968: 1013). The event of nihilism is, in short, a medical emergency. Nietzsche sees the coming generations as having to simultaneously create truth while steadfastly holding that there is no truth (Nietzsche 1968: 616).

To find a path through this devastation of prior illusions to Nietzsche's great health, we must experiment and live dangerously, 'alas, with what protracted searching and succeeding, and failing, and learning and experimenting anew!' (Nietzsche 1885: 3 : 12). The nihilistic flirtation with self-destruction gradually gives way to a long process of convalescence, in which the spirit wrestles with the above-described dangers, risking the possibility that '[she] may even on [her] own road perhaps lose [her]self and become infatuated and remain seated intoxicated in some corner or another' (Nietzsche 1886c: 4). Here the preface shows us clearly an image of an organism lost in the movement towards health. This process of convalescence from nihilism,

which I identify as the *second manifestation of illness* in Nietzsche's narrative, seemingly resolves itself in, or at least converges towards, a state of exuberant health (Nietzsche 1886c: 4). Yet he fails to fully commit to this notion of resolution in health:

> [T]o become sick in the manner of these free spirits, to remain sick for a long time and then, slowly, slowly, to become healthy, *by which I mean 'healthier'*, [emphasis mine] is a fundamental *cure* for all pessimism (the cancerous sore and inveterate vice, as is well known, of old idealists and inveterate liars). (Nietzsche 1886c: 5)

This passage begs unpacking on several levels. First, Nietzsche's qualification of the process of becoming healthy as in fact one of becoming healthi*er* suggests that the initial sickness of which he speaks is already a form or level of health inhabiting a continuum. This suggestion is confirmed in an 1888 fragment: 'Health and sickness are not essentially different… One must not make of them distinct principles or entities that fight over the living organism and turn it into their arena… In fact, there are only differences in degree between these kinds of existence' (Nietzsche 1968: 47). Illness as disparity with health, then, as antagonism, as difference, is only a degree of health itself. Put differently: the disparity of the thing is a constantly shifting and essential part of the thing. Illness as *Verschiedenheit* is necessary to achieve great health, which overcomes *Verschiedenheit* in order to continue overcoming itself.

To return to my claim that we find, in place of origin in Nietzsche, a fall, a falling ill, we see that the organism must become ill before it can become healthi*er*, because falling ill makes those who can survive healthier. And yet *ill* is only a degree of *healthy* – *Verschiedenheit* is a level of health, of the organisation of the organism. Nietzsche's health thus erodes the hierarchised dichotomy of health/illness, in that health constantly turns to illness in order to become *more* itself. Here Nietzsche's will to power does not *resolve*; it only becomes. Nietzsche's disparity of illness simply continues to irritate and stimulate the movement of life in an unending movement of self-overcoming, an opening to sickness that closely resembles Derrida's conception of autoimmunity (we will return to autoimmunity in section II).[11] Health, finally, consists of an extreme, living *Verschiedenheit*: health is (itself) disparity, it is the movement of difference. And the becoming well of the philosopher is a tenuous, perilous, eschatological shifting of levels of intensity, rather than a strictly teleological movement. This constant

shifting, to the degree that it self-overcomes, does so only by plunging its hands back into its self-difference.

In the passage from the preface cited above, we also find its *third and fourth manifestations of illness*: cure as a capability of illness, and the diseases (the sick fictions) of idealism and untruth that this illness can cure. Nietzsche furthers his erosion of the health/sickness binary as described above, by explicitly ascribing a curative value to this sickness, a sickness we can now view as an intensity-level of healthi*er*, a force in this differential movement of the will to health: 'There is wisdom,' he writes, 'practical wisdom, in for a long time prescribing even health for oneself only in small doses' (Nietzsche 1886c: 5). Beyond affirming the productive status of sickness as health's disparity with itself, Nietzsche's prescription for a cure here highlights once more the self-risk involved in his process of lived philosophy: not only can the free spirit lose her way as she inquisitively extends herself further and further 'away', further 'down', as she casts off illusions, but per Nietzsche's prescription, she takes only small doses of a presumably curative health in order to lengthen the initial process of sickness of 'the great liberation', in order to maximise her space for dangerous experimentation. The third manifestation of illness in the text, then, the cure that sickness functions as, is a practice of self-risk and, indeed, a focused kind of self-poisoning through the measured withholding of too much of the pre-revaluation health, the turning to and indeed embracing, instead, of illness in order to remain healthi*er*. This illness as cure, the holding of oneself open to continued infection, is effectively Nietzsche's cure for pessimism. As with the Derridean conception of autoimmunity, he here anticipates, in the revaluating move that consecrates sickness as cure, Derrida's reading of the *pharmakon* as simultaneous poison and antidote (Derrida 1972: 86), especially when we remember that the work of illness replaces any origin for Nietzsche.

Along with nihilism, this extraordinary prescription cures the 'cancerous sore and inveterate vice' of idealists and liars, of those who continue to cling to symptomatic fictions of a sick culture. His grouping of the pessimists includes all those who deny the active force of visceral life: the idealists, who sequester themselves from lived experience; the metaphysicians, who submit human life to transcendent totalisation; the dialecticians, who reduce movement to negation; and the physicians, who quarantine and sedate the ill, submitting them to a normative process of cure. In this preface, Nietzsche employs a language of illness to articulate a set of western values, and to transform these values: the standard social and philosophical traditions are shown to be

diseased, and the sickness that these traditions consistently attempt to eliminate becomes their only and 'fundamental' cure. This is Nietzsche's revaluation of the values Socrates championed – the values he thought could cure his era of, but only worsened, which is to say weakened, its condition. Guided by a 'tenacious *will to health* that sometimes disguises itself as health already achieved' (Nietzsche 1886c: 4, my emphasis), the free spirit affirms, through its will, the ongoing process of sick experimentation of which health consists. Nietzsche's will to health here shows itself as a joyous, critical force that embraces the risk that true health requires of us.

Health, then, as Nietzsche's *fifth manifestation of illness*, is revalued against the backdrop of lived sickness as cure, as a struggle of the will, a condition of brilliant but tenuous critique. In other words, Nietzschean health coincides with convalescence. Nietzsche describes how, 'under the illumination of a still stressful, still changeable health', the philosopher approaches reflexivity, reflecting on her process of isolated and life-threatening illness. Through meditating on this experience of finally questioning our own 'great liberation', he suggests that the purpose of the violent loss, displacement and pain that comprised the initiatory illness from which we never fully separate has been to enable the philosopher to gain 'access to many and contradictory modes of thought': the ability to see through normative values (including, of course, those of health and illness), human-erected teleological structures, and the supposed strength of dialectical thought (Nietzsche 1886c: 4). Yet as his subversion and revaluation of a health/sickness binary structure suggests, this clear vision is produced and nurtured both through the thinker's continuing fluctuation at the level of healthi*er*, and through the *continued* practice of revaluation and critique that constitutes the cure for pessimism. Nietzschean health transforms the wild experiments and singularities of the budding yet confused free spirit into the master's 'dangerous privilege' of living experimentally (Nietzsche 1886c: 4). The convalescent thinker, 'half-turned toward life', but almost reluctantly, gains access to this exhausted space of happiness *by dint of* affirming her chronic relapses as part of the process of self-overcoming (Nietzsche 1886c: 5).

To identify Nietzsche's revalued health as a condition of chronic critique, then, is to articulate his vision of critique as self-vivisection, as living analysis. To live this critique is to chronically affirm illness as your health's self-difference. As Deleuze stresses, Nietzsche urges us towards 'the pleasure of knowing oneself different' (Deleuze 1962: 10), and it is precisely this pleasure that he proffers in this preface, as his will to

health. To know yourself different is to affirm the disparity within you as part of your health, and to render that affirmation a chronic condition. In so doing, you embrace yourself as patient, affirming your fall(ing ill) as differential health, actively participating in self-opening.

II. Self-undoing as Cure for the Cure

> Let's go further still . . . we haven't undone our selves enough.[12]

Because the healthi*er* organism's health *is* precisely its convalescence, its variable *Verschiedenheit*, it thrives by affirming that health as a differential relation, as self-difference. Since each integral adversary of sickness can make the organism stronger, but only by threatening it as a whole, it makes sense that Deleuze and Guattari take the schizo, a liberated schizophrenic functioning as the apex of experimental de-organisation, as *their* model for new health, because their aim is precisely *to destroy the organism* that still remains in Nietzsche. They champion a sick figure pushed past the limit of sickness to focus the problem of the organism as itself ill, as a loophole remaining in Nietzsche's overall project of affirmation, a loophole that negates life's flourishing. In this critique of organisation, they go beyond Nietzsche by inserting their own position into his differential relation of sickness and health, and cleaving this pair in order to continue Nietzsche's task of revaluation – pushing him to overcome himself. Thus in their rendering illness healthy precisely *because* it attacks the organism, Deleuze and Guattari perform *philosophos* in its exact meaning: they act as friends of wisdom, in Zarathustra's sense of the term: as Deleuze glosses: 'a third person between "I" and "me," who pushes me to overcome myself, to be overcome in order to live' (Deleuze 1962: 6). Deleuze and Guattari have thus caught Nietzsche's infection, and have overcome him so that he might live on. They take his health as convalescence and make it what Deleuze has called a 'health of tomorrow' (Deleuze 2004: 258).

Reading Nietzsche's flickering convalescence as distinctly non-teleological in that it has no defining endpoint but rather functions by dint of the will to health, his emphasis on integrity and organisation of drives in an organism, healthy or no, still presents an obstacle for Deleuze and Guattari to overcome. Their own 'cure for the cure' is a contemporary championing of Nietzsche's healthi-er, pushed past the integrity of the organism. Nietzsche's health as chronic critique already attempts a curing of the cure(s), and his targets overlap with those of

Deleuze and Guattari – to mention just one, Socrates' cure of dialectics and idealism, and the turning away from the body – but Deleuze and Guattari take this body which Nietzsche, in his formulation of 'meaning, physiologically speaking' (Nietzsche 1886b: 4), has joyously affirmed, and deorganise it to at least the point of the tragic chorus, to the brink of becoming-imperceptible, of self-annihilation; health, then, as self-annihilation through the *Corps sans Organes*, the body without organs.

Before we turn to the BwO chapter, let us call to mind its context: Deleuze and Guattari undertake their revaluation of health under the general name of 'schizoanalysis' in *L'Anti-Oedipe* and *Mille Plateaux*. Their project boils down to four figures of illness, which, like those of Nietzsche, work together to perform a revaluation: they articulate first, the oedipal cure as in fact the sickness to target; second, illness as defined by a certain distance from the oedipal master-text; third, schizoanalysis as the method to 'cure us of the [oedipal] cure'; and finally the fourth figure of the hypochondriac as a failed attempt at schizophrenisation. Beyond psychoanalysis, the authors clarify their larger target again and again as the repression, reduction and normativisation enacted through both a transcendent, teleological metaphysics and a representational, depth-avowing hermeneutics (Deleuze and Guattari 1972: 89, 127–9) – both targets of Nietzsche's revaluation. Psychoanalysis, Deleuze and Guattari write, inherited many negative traits from both these traditions, and current society in general has inherited Oedipus as its dominant structure. The task of their critique is to initiate the restoration of the creative force of desiring-production that psychoanalysis with all its baggage has trapped and subsequently displaced (Deleuze and Guattari 1972: 130).

To begin putting our four figures into play, Deleuze and Guattari situate their critical position in terms of a need to 'cure us of the cure' (Deleuze and Guattari 1972: 80). This oedipal cure as a sickness that needs curing is the *first figure of illness* in their project that I want to identify, and it consists in a structure of organisation, signification and subjectification that displaces the positive, productive desire of the unconscious, repressing that real desire and forcing us into a system wherein desire equals an unfulfillable lack. This repressing, normative cure forces us to exist as carefully organised subjects. Within psychoanalysis, illness consists in a departure from the oedipal axis, although it is always defined in terms of this axis. This conception of illness, as a *second figure* in the text, consists in the inability, temporary or permanent, to resolve the oedipal phase. Thus they protest: 'We are

extremely tired of those stories where one is said to be in good health because of Oedipus, sick from Oedipus, and suffering from various illnesses under the influence of Oedipus' (Deleuze and Guattari 1972: 96). Their call for a revaluation of health and illness thus requires a profound movement of de-oedipalisation.

As we will see, Nietzsche's *Selbstdisziplin*, the fighting of everything sick in oneself, is carried out in the BwO chapter, as Deleuze and Guattari instruct you to fight signification, organisation and subjectification, as strains of the sickness of oedipality. In Nietzschean terms, oedipality would be the latest fiction generated by a still sick drive organisation, a symptom, like Socrates' thought, of the drive to preservation's decadence and exhaustion. Thinking Oedipus in terms of Nietzsche's diagnosis of nihilism, the psychoanalytic project is a last-ditch attempt to maintain transcendent truth in the face of the desperate realisation of meaninglessness that constitutes nihilism. In this sense, Deleuze and Guattari's project can be seen as an attempt to get us back to that baseline sickness, the first figure of illness that I identified in Nietzsche's *Menschliches* preface, that allows the individual to wallow in the very depths of nihilistic questioning before the strongest ones slowly begin to convalesce, while the weaker ones become 'lost in some corner', i.e. they die off. Thus in Nietzschean terms, to rid ourselves of Oedipus is to first become dangerously sick, and then slowly, with our arms always wrapped around illness, to convalesce. But again, when Nietzsche continually proclaimed that 'I must fight against everything sick in me', his drive organisation is the spot, as it were, that he missed. His grounding conception of the organism is thus paradoxically revealed, according to his own system, as an interpretation symptomatic of sick drive organisation.

In Deleuze and Guattari's terms, we need to 'schizophrenise', not only to follow Nietzsche's example but to rid ourselves even of the strict coherence of his drive organisation. Their schizoanalysis, as a practice of de-oedipalisation or 'schizophrenisation' (rather than oedipalisation, neuroticisation, normalisation), constitutes the revalued cure for psychoanalysis' unacceptable oedipal cure (Deleuze and Guattari 1972: 80). This revalued cure is their *third term of illness*. Deleuze and Guattari proffer the schizophrenic as a figure who mocks and nearly escapes the oedipal system, often being institutionalised because of her sheer *lack* of Oedipus – her inability to inhabit some relation to the normative axis. Deleuze and Guattari essentially propose a movement towards a de-institutionalised schizophrenia as our only avenue for de-oedipalisation. Thus, like Nietzsche, they destabilise the

health/sickness binary by revaluing illness as the cure for a ubiquitous and crushing disease, the disease of the rejected oedipal cure (with all its philosophical baggage) as norm and practice of health. The new cure is thus posited as lived illness in the extreme, a position nearly identical to Nietzsche's in his identification of the free spirit's dangerous, experimental sickness as the convalescence-cure to diseased philosophy.

In *Mille Plateaux*, published eight years after *L'Anti-Oedipe*, Deleuze and Guattari recast the process of schizophrenisation in the chapter titled 'Comment se faire un Corps sans Organes?' (Deleuze and Guattari 1980: 185). In this text, the authors articulate the BwO as a set of practices that constitutes a paradoxically *produced* limit; we both produce and inhabit 'it', this set of practices, 'scurrying like a vermin, groping like a blind person, or running like a lunatic', without ever arriving *at* it (Deleuze and Guattari 1980: 186). Like Nietzsche's revalued health, whose continual mode of critique causes it to always fluctuate at the intensity level of healthi*er*, it is in part the enactment of non-arrival that produces this non-organism, this mode of existence *as* set of practices. In this sense, their de-organising self and Nietzsche's healthi*er* organism are roughly matched, in that they each function by dint of non-teleological non-arrival.

The great liberation of Deleuze and Guattari's dismantling subject consists in the process of struggling against organisation, signification and subjectification. As such, the production of one's BwO begins the moment one attempts to experiment with disorganising oneself as organism, the moment one resists signification and interpretation, the moment one 'converges' towards a state of desubjectification or de-individualisation by beginning to dismantle or undo oneself (*défaire notre moi*) (Deleuze and Guattari 1980: 187). The process of dismantling oneself as an organism, of dismantling one's 'organs', is not a process of fragmentation that references a lost unity, nor is this process a question of returning ourselves to an undifferentiated sphere (as Nietzsche seems to suggest early on in the *Geburt*) that requires an ultimate differentiable totality as frame. Rather, the BwO constitutes a mode of living and thinking as continual (and again, paradoxical) self-construction through the production of intensive difference (Deleuze and Guattari 1980: 203). In this way, Deleuze and Guattari echo Nietzsche's predominant refutation of teleology and totality in favour of an intensive process of becoming. In Nietzsche's vision, the world dissolves into 'a becoming that knows no … weariness: this is my Dionysian world of the eternally self-creating … and self-destroying' (Nietzsche 1968: 1067). This process of persistent becoming that self-creates and self-destructs

is Nietzsche's will to power. In the BwO's variable self-(de)construction, Deleuze and Guattari continue Nietzsche's vision of becoming as life (as will to power).

In its basic conception, the BwO disavows depth, enacting this disavowal through its self-*unfurling* (Deleuze and Guattari 1980: 197): its self-production as a de-organised surface on which this intensive difference can pass. In the spirit of Nietzsche's genealogical project, this refutation of depth betrays the philosophical and psychoanalytic tie to a hidden meaning to interpret, a secret essence to unlock, a repressed trauma to read and realign with the oedipal axis. By undoing itself as a standardly perceiving, consuming, identifying and interpreting organisation, the organs of this body flatten out, as it were, to comprise a kind of surface on which desire can move and produce. Where Nietzsche's free spirit was compelled by the will (to health), Deleuze and Guattari's self-undoing-self is propelled through her trajectory of experimentation by the force of desire; the Nietzschean will to health, to power, here has been transformed into desire.

From the start of their set of instructions, the authors stress the risk involved in this process of self-recreation or dismantling,[13] introducing the hypochondriac, their *fourth and final figure of illness*, to distinguish between the 'good', or 'full', BwOs and the failed ones. They describe the hypochondriac body as an 'emptied and dreary' body whose organs are destroyed, a body to which 'the damage has already been done' and where 'nothing happens anymore' (Deleuze and Guattari 1980: 199, 186). The hypochondriac body, for Deleuze and Guattari, is a *hypochondriac practice* of (attempted) lived self-critique, of self-dismantling. The failure of the hypochondriac practice, for the authors, lies in its inability to produce intensities, to perpetuate the production of desire; in Nietzschean terms, to perpetuate the will to health. In other words, the hypochondriac is not a good machine for production. Instead, one finds stasis as a result of destruction, of a 'messed up' or 'botched' practice of self-dismantling.

In the passage where they describe this hypochondriac failure, the reader encounters a woman of whom nothing remains but 'the skin and bones of a disorganized body' (Deleuze and Guattari 1980: 186). In medical terms, hypochondria consists in a somatic over-concern, including the morbid attention to the details of bodily functioning and the exaggeration of any symptoms. So a hypochondriac practice overinvests in a projected image of health by obsessing over their failure, as organism, at 'proper' bodily organisation. On this level of organisational failure, Deleuze and Guattari's hypochondriac consists

of nothing but a sac filled with broken pieces, not only unable to properly function on a traditional medical level, but certainly unable to engage in a creative process of self-dismantling or self-recreation. The hypochondriac BwO essentially fails because her fear of illness (in the sense of their second figure, illness as proscribed by Oedipus) manifests through a constant *hermeneutic practice* of self-constitution that frames itself in relation to a prescribed totality of health, rather than the desired un- or de-signifying practice of self-dismantling that refutes any lost or desired unity. The hypochondriac's obsessional reading of potential symptoms, her constant, paranoid awareness of the broken-ness of her organs and functions, creates an interpretive closed circuit where she encloses herself in a process of self-interpretation. And again, this closed process refers to a master-text of ideal health: health as essence and totality, health as oedipal resolution. Therefore the hypochondriac BwO consists in a paranoid, hermeneutic practice that manifests as a trap filled with illness.

The failed hypochondriac shows itself in Nietzsche's *Menschliches* preface, as the possibility of the spirit who 'may even on [her] own road perhaps lose [her]self and become infatuated and remain seated intoxicated in some corner or another' (Nietzsche 1886c: 4). The hypochondriac's hermeneutic practice of self-constitution maps nicely onto Nietzsche's lost spirit, especially considering the context of the spirit's questions as indicative of severe nihilism as it desperately realises that it is 'in its very body… false': infatuated and intoxicated in some corner, she has failed in some experiment or another by falling into a normative trap of representation. Her will to health has failed to adequately propel her through her experiments and singularities, and she collapses in on herself, 'infatuated'.

Given this obsessive image of symptom-reading, what, we may ask, distinguishes Nietzsche's constant self-examination, his fight against everything sick in him, his living critique as self-vivisection, from the hypochondriac BwO? First and foremost, Nietzsche's practice of self-vivisection is precisely a practice of self-opening (as opposed to the closed sac of the hypochondriac), of keeping oneself open to scrape away at any settling infection, but simultaneously to always allow illness, as a level of health itself, *in*. To self-vivisect is not only to search for any symptom of drive disorganisation, but to affirm and embrace one's difference from this organisation. Thus Nietzsche is fundamentally *not* to be considered hypochondriac in Deleuze and Guattari's sense, as represented in the BwO chapter, for the reason that Nietzsche affirms illness in his differential movement of healthi*er*. His model for

health constitutes in fact the opposite, in all ways but one, of this hypochondriac BwO.

The hypochondriac and Nietzsche take different things to be symptoms, and they each read these differing types of symptoms in crucially different ways. Nietzsche reads symptoms as a philosophical doctor striving towards convalescence, while the hypochondriac reads them as hermeneutic revelations of inner failure. The former is critical, the latter paranoid. Nietzsche's model of interpretations as only the final surface of a raging struggle of drives that rises to consciousness is certainly proto-Freudian in some ways;[14] Nietzsche's emerging perspectives, as symptoms of the healthier or sicker order of the drives, are not completely foreign to the Freudian symptom, which signifies an underlying illness to be read as text, inasmuch as it is possible. But unlike Freud's murky unconscious, which comes to be structured like a language, Nietzsche's model for drives and what they produce is *not* linguistic; instead, he provides a physiological system that produces physical yet readable fictions (these last being symptoms, his moveable host of metaphors). In this difference from the psychoanalysis that follows him, Nietzsche forms a great ally for Deleuze and Guattari in their rebellion against the signification-driven domains of Freud and Lacan, by providing a view of life's activity that is fundamentally physiological, rather than signifying. *Bedeutung* is always considered, *physiologisch gefragt*, in the profound sense of its role in the fluctuation of health. The hypochondriac, on the other hand, obsessively attempts to read *Physiologie* as primarily signifying. The difference may seem slim, but it is crucial. Yet Nietzsche's emphasis on interpretation as the congealing, the production, if not the expression, of drive organisation, places him as a distant cousin of the hypochondriac, in that, as I have already articulated, he remains attached to the conception of the organism. In this sense, he reifies an oppressive, constricting structure each time that he reads a symptom as the production of the organism's drives. In this distant sense, he fails in his act of reading. Unlike the hypochondriac, though, this problem of organism as ground does not prevent him from envisioning health as revalued convalescence.

To avoid becoming hypochondriac, Deleuze and Guattari preach caution through an 'art of dosages' (Deleuze and Guattari 1980: 198), advising us to take care as we practice our schizophrenisation (note that we return here to our third figure of illness: illness revalued as cure for the cure). In order to succeed in making yourself a BwO, you must follow a 'rule immanent to experimentation: injections of caution' (Deleuze and Guattari 1980: 186). Essentially, their art of dosages

consists in taking small doses of self-dismantling, of de-institutionalised schizophrenia, itself, which amounts to taking less and less of your*self*, as if weaning yourself *off* a medication, but the (organised, signified, subjectified) medication here is you: *moi*: the organism. To engage in this experimental practice, you open yourself slowly to connections. You give yourself small tastes of de-organisation, inventing 'self-destructions that have nothing to do with the death drive', nothing to do with a movement towards stasis (Deleuze and Guattari 1980: 186).

In a gloss complimentary to their art of dosages of self-destruction described above, Deleuze and Guattari describe the constant reterritorialisation necessary to remain alive in the process of making yourself into a BwO:

> You have to keep enough of the organism for it to reform each dawn; and you have to keep small supplies of signifiance and subjectification, if only to turn them against their own systems when the circumstances demand it, when things, persons, even situations, force you to; and you have to keep small rations of subjectivity in sufficient quantity to enable you to respond to the dominant reality. (Deleuze and Guattari 1980: 186)

This passage expands their figure of the dose as a two-way street of engaged process, of a procession of self-construction, of a struggle towards freedom. They insist on supplies and rations to ensure function and sustenance, and yet these rations are doses of the material against which we struggle, doses we may indeed only use as weapons against 'their own systems'. Thus emerges an image of pushing towards and pulling back from our BwO, even as we produce it, as a limit that, though constantly in the process of production, we never reach. This pushing-pulling-production of the limit relies necessarily on their art of dosages, an art that emerges at this point in their text as a cautious, balanced practice of self-poisoning. The image they offer is not simply a homeopathic one, wherein you would consume an incredibly diluted form of whatever ails you in order to counteract a condition. Instead, Deleuze and Guattari clearly prescribe *both* small doses of self-destruction and small doses of the organisation, signification and subjectification that block your self-destruction while keeping you alive and communicative.

With Nietzsche's prescription of 'health for oneself only in small doses' ringing in our ears, this art of dosages emerges as an engagement with toxicity, at the risk of death, for the enactment of radicality. What Nietzsche, Deleuze and Guattari suggest is an experimental practice that

balances itself between immunity and *auto*immunity. On the one hand, you take in 'self-destruction' in small doses, to get yourself used to less of yourself. But at the same time, this very practice is an autoimmune practice of immunity – you maintain in your system quantities of the former health, now revalued as that from which you wish to escape (the oedipal cure as sickness), in order to approach the new health, to enact the new cure. Thus an autoimmune self-immunisation allows the self to deterritorialise and reterritorialise itself into just enough of a balance to continue its experiments. This autoimmune practice of health could be rearticulated as Derrida's account of autoimmunity pushed to an active life and thought experiment – the move from a description of a system of 'self-destructive conservation' (Derrida 2005: 55) to a prescription for increasingly large doses of the threat, with an end (that is no end) to deorganisation.

This process of radical immunisation that Deleuze and Guattari prescribe is essentially identical to Nietzsche's offering of health as described in section I: health as *Verschiedenheit*, as disparity, and illness as the self-difference of health as it functions as *will* to health. This health as disparity that continually becomes and overcomes constitutes the condition of chronic critique that Deleuze, Guattari and Nietzsche all articulate as their revalued health. Now to what extent do the convalescent free spirit and the schizophrenising BwO converge in this radical practice of health? Are the two figures equal in their capacity for and enactment of critique?

III. Weighing Arrival and Annihilation in the Two Accounts of Critique

> . . . we're not there yet, we can't arrive . . . it's a question of life or death. . . [15]

A brief consideration of first, the narration of destination and second, the attitude towards death in the two projects clarifies the comparison. Both Nietzsche and Deleuze and Guattari spatialise their account of becoming healthy, with differing results: Nietzsche first describes the journey of the developing free spirit in terms of altitude and escape: this midway condition is characterised by 'a pale, subtle happiness of light and sunshine, a feeling of birdlike freedom, bird-like exuberance. . . ; one lives . . . near or far as one wishes, preferably slipping away, evading, fluttering off, gone again, again flying aloft' (Nietzsche 1886c: 4). The relation here is one of slipping, of evading, but at an unusual altitude,

thereby introducing the height, the high nature or privilege, of the spirit. He confirms that this quality of altitude persists in the convergence towards health, describing how as the free spirit gains philosophical maturity, 'power and right and spaciousness of perspective grow into the heights together' (Nietzsche 1886c: 6). The spatiality and altitude in his account constitute precisely the distance implicit in his order of rank.

He then makes reference to the 'inner spaciousness' that accompanies the acquisition of exuberant health, suggesting not so much a spatial destination as an expansion of the experimental organism. Finally, towards the end of the narrative, he describes his space of health shot through with breezes, with spots of sunlight on the wall. The healthi*er* convalescent 'loves to sit sadly still' in this space, 'to sit in the sun' (Nietzsche 1886c: 6). To summarise, then, Nietzsche evokes an inner space of convalescence at a high, sunny altitude that develops through a process of slipping, evading, fluttering. The autoimmune immunisation of his art of dosages is performed within this movement of fluttering against a space of elevated health as convalescence, in the tastes of sunlight and the sad relapses that constitute the spirit's existence. Thus while Nietzsche's health = convalescence, this convalescence, this healthi*er* operates at a higher altitude.

For Deleuze and Guattari's schizophrenising self, '[the] voyage does not necessarily imply great movements in extension; it becomes immobile, in a room and on a body without organs – an intensive voyage that undoes all the lands for the benefit of the one it is creating' (Deleuze and Guattari 1972: 319). Like Nietzsche, this process of becoming healthi*er* occurs largely within (and against) the self the depth of which all three writers disavow (as a result of the comparative process here, Deleuze and Guattari begin to carefully unfurl the free spirit, her inner spaciousness folding out to form a surface of intensity). Deleuze and Guattari's reference to a 'room' does not fix the destination of the journey; rather, their prose indicates a casual starting point for a voyage that undoes 'all the lands' – every established, organised land that the dismantling self has and could inhabit – in order to open the new land it is *creating* through its self-destruction, never the land it has *created*. The voyage here has strictly no destination, only a creative process of becoming that sustains itself through its radical practice of autoimmune self-immunisation.

In terms of destination, then, Deleuze and Guattari's narrative offers a slightly more critical figure, one built on and extending Nietzsche's convalescent. Although Nietzsche's free spirit engages in

this autoimmune self-immunisation by fluttering at an intensity-level of healthi*er*, his narrative suggests an ultimate possibility for relative stasis at a high level of thought, for the founding of a new 'land' of truth. Deleuze and Guattari take Nietzsche's health to a new level by refuting any possible *arrival* of the lived critique they propose. Another way of articulating this point is that while in Nietzsche's preface there is a fifth term of illness, health, Deleuze and Guattari stop at four, offering only illness revalued as the practice of cure (of schizophrenisation). Nietzsche's reification of health at the end of the *Menschliches* preface renders his account slightly more resolved. That fifth figure, again, is equal to convalescence – to Nietzsche's healthi*er* as an affirmation of non-arrival – but an organised convalescence on high.

The question of self-annihilation re-poses that of destination, but in a different key. The question brings us back to the problem of the organism in Nietzsche. 'I love', Zarathustra says, 'those who do not wish to preserve themselves' (Nietzsche 1885: 3 : 12); and yet even in the unconcern for self-preservation, the self as organism remains the basic unit which may, in its experimentation, become annihilated. For Deleuze and Guattari, it is precisely the annihilation of self that constitutes the BwO's gradual process of becoming. For Nietzsche, in other words, an organism becomes and becomes until it dies; for Deleuze and Guattari, an organism becomes to the degree that it stops being an organism, to the degree that it starts being something other. Nietzsche's 'pleasure of feeling oneself different' is, for Nietzsche, the feeling of difference in the self; for Deleuze and Guattari overcoming him, this pleasure constitutes the undoing of the very 'oneself' who feels. Thus while Nietzschean becoming is a process that moves to the brink of death, sometimes slipping over the edge, the death of the organism is the end of the organism; the end of the self = arrival. For Deleuze and Guattari, the end of the organism is the beginning of real becoming, not arrival at death (although becoming certainly risks this mortal end).

Once again, the absence of a fifth figure in Deleuze and Guattari's narrative serves as an indication that they have succeeded in overcoming Nietzsche, in allowing him to live by loving him as philosophical physicians. In the same way that Nietzsche revalues health for us as self-opening, Deleuze and Guattari open his self-opening organism to further revaluation; in this sense, their project liberates Nietzsche towards a health of tomorrow by helping him to begin deorganisation. It is precisely at this juncture of physiological *philosophos*, of loving Nietzsche by helping to undo himself, that his work opens to a becoming beyond the measure of organisation.

Notes

1. Nietzsche 1886a: 2. My emphasis. Unless otherwise noted: ellipses indicate my own omissions from quoted material; all translations are my own *except* for excerpts from *Der Wille Zur Macht*; all citations for Nietzsche refer to section numbers rather than page numbers; all citations for Nietzsche *except* for fragments from *Der Wille Zur Macht* refer to: Friedrich Nietzsche (1966), *Werke in Drei Banden*, ed. Karl Schlechta, 3 vols, Munich: Verlag.
2. Nietzsche 1886c: 5. My emphasis.
3. The autobiographical reference here is likely to some combination of the traumas of war and the diptheria, dysentery and likely syphilis that he contracted during his time as a medic in the Franco-Prussian war.
4. As Deleuze puts it (1962: 3).
5. Golffing renders *Genesung* as 'recovery', while Hollingdale uses 'convalescence'. When writing English, I opt for 'convalescence' over 'recovery' because of the connotation of gradual, not necessarily full recovery of a patient. As opposed to 'recovery', 'convalescence' includes the later stage of an illness that, despite the patient's symptoms improving, continues to be a source of infection.
6. Here is Nietzsche's theory of the organism's drive organisation, in a nutshell: A healthy organism's drives have a clear order of rank in which a dominant drive struggles with and synchronises the weaker ones, rather than negating them, resulting in an integrity with a clear goal (Nietzsche 1968: 778, 800). A weak organism's drives participate in a constant, unordered antagonism, and the organism thus attempts to satisfy all the drives rather than a dominant one, resulting in a lack of integrity and purpose (Nietzsche 1968: 778). Even in inorganic life, Nietzsche sees the constant struggle of the will to power manifest as the repelling force exercised by atoms (Nietzsche 1968: 342). This emphasis on mutual struggle and constant disparity offers Nietzschean health as the constant engagement with difference, which in turn suggests that illness, as disparity, as that against which health struggles, is always right behind health, constantly surrounding it. The will to power, Nietzsche writes, seeks what resists it, and in this sense, health seeks sickness in order to push itself even further (Nietzsche 1968: 656). As Ahern explains: 'every level of health [in the organism] requires its particular form of sickness as its unique adversary threatening the well-being of the organism as a whole. The organism is tested with the threat of destruction and thereby forced to overcome previous levels of sickness and health or be destroyed' (Ahern 1995: 39). A truly healthy organism is always entangled with its own level of illness so that it can grow as strong as possible, push as far as possible. Given the will to power's function as a will to growth, an organism may, Nietzsche explains, actually destroy itself in an attempt to become more (Nietzsche 1968: 688). In a healthy organism, the urge to grow far outreaches the urge to preserve oneself (Nietzsche 1968: 702). Life itself, as will to power, says to Zarathustra: 'I am that which must overcome itself again and again' (Nietzsche 1885: 2 : 12)
7. As Ahern acknowledges (1995: 84).
8. In the epilogue to *Der Fall Wagner*, he asks where a diagnosis of the modern soul would begin. The reply: 'With a resolute incision, … with the *vivisection* (*Vivisektion*) performed of the most instructive case' (Nietzsche 1888: *Epilog*).
9. Ahern summarises this dynamic neatly (1995: 128).
10. Ahern articulates this particularly well (1995: 38).
11. In, for example, Derrida's conversation with Borridori on autoimmunity (Borridori 2003: 94).
12. Deleuze and Guattari 1980: 187.

13. To take the first warning, for example: 'you can mess it up. Or it can be terrifying, and lead you to your death' (Deleuze and Guattari 1980: 185–6).
14. See, for example, Nietzsche 1882: 333.
15. Deleuze and Guattari 1980: 186–7.

Stuttering in Beckett as Liminal Expression within the Deleuzian Critical-Clinical Hypothesis

Erika Gaudlitz University of Ballarat, Australia

Abstract

This paper inquires into the nexus between the Deleuzian critical-clinical hypothesis and its literary instantiation in Beckett, with a focus on *How It Is* (1964) and *Worstward Ho* (1983b). I propose to read the interruptions in style symptomatically, and stuttering language in Beckett as liminal expression, thus tracing the flows and breaks of desire which Deleuze theorises in the sense of a symptomatological unconscious. The schizoid style as liminal expression exemplified in Beckett's work will be read as marking transit stages in the process of becoming which invites taking it as a proper language of the body without organs.

Keywords: Deleuze, symptom, symptomatology, liminal expression, the critical-clinical, stuttering, Beckett

I. Introduction: The Critical-Clinical Hypothesis

Several at first heterogeneous notions come together under the umbrella of the critical-clinical hypothesis: the critical-clinical as a type of critique, symptomatology as a mode to identify intensities and inner forces, and a range of exemplary symptoms such as stuttering which embody the specific type of critique the critical-clinical hypothesis attempts to achieve. The fusion, or folding, of the critical as intellectual evaluation with the clinical as medical, or psychiatric, observation is of particular interest, both striking and baffling. I read the critical-clinical as a type of

Deleuze Studies 4.2 (2010): 183–205

www.eupjournals.com/dls

critique which aspires to overcome the traditional but artificial splitting of mind and body that excludes bodily symptoms from the critical apparatus. Symptomatology will be positioned here as opening access to bodily affectivity, thus supporting the critical-clinical as a mode of registering intensities. Body-language as vocal and gestural stuttering becomes the clinical aspect of the symptomatological critique.

The critical-clinical as a specific type of critique activates symptomatology as a mental-corporeal mode of inquiry which I will exemplify by Beckettian stuttering. Symptomatology as a clinical, medical and psychiatric category carries a sense of enigma, admitting our ignorance of 'what a body *can do*' (Deleuze 1983: 36–7; italics in the original), as expressed by Deleuze in reference to Nietzsche and Spinoza.[1] The reading and grouping of symptoms to form a syndrome which can be named and identified, as Deleuze does with Beckettian stuttering, demands clinical perspicacity, an intuitive awareness of intensities and inner forces as yet without a name or an identification.[2] Stuttering, then, functions as an exemplary symptom to probe the critical apparatus of the critical-clinical since it offers a specific setting, being situated in its sonority between body and mind, connecting the invisible inside and the more accessible outside.

Deleuze's final *Essays Critical and Clinical* (Deleuze 1997), with a distinctly literary orientation, conclude his studies embodying the critical-clinical as a type of critique in the symptomatological mode. They exemplify a range of symptoms in their procedures and formulas – stuttering, masochism, schizophrenic and schizoid states, and Jarry's pataphysics – and serve as a framing for my paper.[3] However, a specific symptomatological critique is an integral part of Deleuze's work as evidenced in his testament, the final essay 'Pure Immanence – A Life' (2002), which concludes with an impersonal, and yet personal, literary reference (to Bousquet).

> A wound is incarnated or actualized in a state of things or of life; but it is itself a pure virtuality on the plane of immanence that leads us into a life. My wound existed before me: not a transcendence of the wound as higher actuality, but its immanence as a virtuality always within a milieu (plane or field). (Deleuze 2002: 31–2, referring to Bousquet 1955)

A life is impersonal yet singular, but to grasp its fullness Deleuze demands a wilder empiricism (Deleuze 2002: 25) which does justice to mind and body and the work of art.[4] Since it addresses our affects and our percepts, such an empiricism achieves a more complete grasp than the speculative mind alone can offer.

The paper first positions the Deleuzian critical-clinical hypothesis, setting out to read style as stuttering, before going on to explore stuttering as liminal expression, in its specific exemplification in Beckett. In this way, the intention is to demonstrate that the critical-clinical as a specific Deleuzian type of critique deploys symptomatology as mode and method, and that style as stuttering, the trembling of language, and the writer as stutterer, hold a specific place in Deleuze's understanding of writing.

II. Style as Stuttering in Deleuze

The focus here will be on three related aspects: first, the Deleuzian setting; second, the creative process defined in Deleuzian terms as a delirium;[5] finally the symptom as a type of Beckettian gesturing language. In terms of definition, a brief note is in place. Liminal expression is understood here as frenetic pseudo-syntax, a stuttering language in the sway of inner forces, verbal and bodily exhaustion and progressive loss of memory. I propose to read the interruptions in style symptomatically, and stuttering language as tracing the flows and breaks of desire theorised by Deleuze in the sense of a symptomatological unconscious. 'Writing is a question of becoming, always incomplete, always in the midst of being formed.' Becoming/writing is understood not in its mimetic sense or as identification, but in order to 'find the zone of proximity, indiscernibility, or indifferentiation' (Deleuze 1997: 1). The schizoid style can then be read as liminal expression exemplified in Beckett's work as marking transit stages in the process of becoming.

The Deleuzian setting

The first aspect exploring style as stuttering focuses on the Deleuzian stylistic criteria of excess, delirium and diagnosis. In Deleuze's understanding, the style of a literary creation transcends the textual level. It is not just an expression following the demands of the content but an original propulsion of life, of existence gushing forth, as he forcefully expresses it. There is in such a conception of style no separation of expression and expressed, of style and content. Although some textual boundaries are acknowledged, style supersedes the writing. There is an excess which can never be contained. The first criterion of style with a view to style as stuttering is its excess. The inner force of propulsion or desire is of a delirious nature since it is not yet regulated and streamlined

by mental and intellectual control. Delirium then becomes the second defining criterion of style within the symptomatological critique of the critical-clinical. 'All delirium is world-historical, "a displacement of races and continents". Literature is delirium, and as such its destiny is played out between the two poles of delirium' (Deleuze 1997: 4); it is vacillating between the disease of the world to be diagnosed and becoming a measure of health when successful. Since the delirium originates in the unconscious, within the emerging libidinal field, the established language patterns, understood here as majoritarian in the Deleuzian sense, will not contain the as yet unshaped visions and are not sufficient to express them. This makes stuttering as delirious expression a defining characteristic of the Deleuzian minoritarian, yet another example of symptomatology and a genre within the critical-clinical. Style in the Deleuzian sense becomes an indicator, or descriptor, of the inner, if still stuttering voice, urging for actualisation. More than the expression of content, of ideas or opinions, style is conceived as an original event in the Deleuzian sense, of a pre-individual and impersonal stature: a haecceity, a singularity. The creative act of writing, then, if viewed in the frame of the critical-clinical, cannot be set apart from the empirical framework of Deleuze's philosophy.

Deleuze maintains that writers create a style as an expression of a way of life. At the same time, this expression is a particular reading of symptoms, a diagnosis of life, culture, civilisation and society; a critique of symptoms as observed in life or imagined in a writing. Style as diagnosis can be viewed as the third criterion. Style as stuttering realistically can appear in writing in the image of characters stuttering, however, beyond this textually bound stuttering, style as stuttering more importantly concerns the writer as stutterer. 'It is no longer the character who stutters in speech; it is the writer who becomes *a stutterer in language*' (Deleuze 1997: 107; italics in the original). Thus the creative writer who is intent on setting his style makes the language stutter; the language becomes intensive and affective. This means that the stutter displays the movements of affects.[6] The stuttering elements can be treated as symptoms reflecting back on the inner forces which break forth. This type of expression displaying the affects is situated at the margin of language and is of a pre-linguistic nature. To support the display of affects in the stutter, the writer draws on the milieu or atmosphere so as to fuse expression and content of the writing. Deleuze evokes a whole range of possible degrees of stuttering: the quiver, the murmur, the stutter, the tremolo, the vibrato (Deleuze 1997: 108). These stylistic variants of affective stuttering reverberate in

the words, the syntax and the progression of the text. The stuttering, vibrating, trembling evoke the gaps through which affects break forth, often underlined by the rhythms of breathing. This points to the libidinal mechanism theorised as desiring-production.[7]

Drawing together the criteria of style as stuttering, excess, delirium and diagnosis, with a view to their function in liminal expression, Deleuze differentiates between two levels of stuttering: the dissociation of words and the syntactical dissolution, and the complex symptomatological trembling of language which takes in the effects in the milieu. Thus the actual stammering of the characters, beyond the stutter of the language, is doubled up. The excess produced in language becomes an undercurrent of the critical-clinical methodology conceptualised as minoritarian in the sense of a dissonant undertone of the major language which adheres to the equilibrium of morphology and syntax. Looking deeper into the structure of the changes which language undergoes under the impact of affects, stuttering eventuates as variation and modulation: 'Language trembles from head to toe.' Allowing affect to emerge in language as types of variation, overlapping 'zones of variations', 'introduce[s] desire into the corresponding field' (Deleuze 1997: 109). Language in style as stuttering becomes a libidinal field drawing in the clinical, symptomatological aspects and thus pushing beyond the critical, towards liminal expression.

To summarise, style as stuttering eventuates as a new, foreign language within the established language and, if successful, erases itself, becomes 'nonstyle', a not yet explored language, a language-to-come. Style as stuttering offers a new selection and combination of linguistic/literary elements. Style as 'nonstyle' reaches its liminal expression: 'to push language as a whole to its limit, to its outside, to its silence'. With its procedures as tools and instruments of resistance to established language, style as stuttering manages 'digging under the stories, cracking open the opinions, and reaching regions without memories, when the self must be destroyed' (Deleuze 1997: 113), and last but not least does away with, or does without, the self as organising principle.

The creative process as a delirium

I now turn to the second aspect of style as stuttering, how in the creative process excess, delirium and diagnosis, explored above as Deleuzian criteria of style, merge to draw towards the liminality of expression. The Deleuzian criteria of style as stuttering offer a first mapping of the

critical-clinical hypothesis, of the ways in which the critical-clinical as a type of critique, symptomatology as a mode to identify intensities and inner forces, and stuttering as embodiment and example of the specificity of a critical-clinical critique can be hypothesised. In these observations I follow Deleuze's late essays on the critical-clinical (1997 [1993]) and the (im)personal statements on a wilder empiricism and immanence (2002 [1995]). What ties the critical-clinical essays together is the idea of the creative process involving a direct approach to the process of life, to the immanence of life. This sets out parameters for artistic creation. It is the directness of approach and its immediacy which becomes the inner link between the critical and the clinical. And it is only the linked process which allows access to the process of becoming, not accessible to the critical alone. This inner link, or folding, of critical and clinical deals more comprehensively than just the critical by itself with the process of becoming and thus makes the symptomatological critique an apt and fruitful mode to open a path into Beckett's elusive if not unreadable works. The symptomatological critique aims at achieving several purposes: immediacy, affectivity, delirium; that is, grasping becoming as a flux, not as a status of being, which has repercussions for our understanding of subjectivity and temporality in literary texts.[8]

Defining the creative process as a delirium leaves the orderliness of boundaries behind and has not yet settled on new terms. The unbound flux opens the way towards new kinds of expressions, of style, of associative and paradoxical imagery. Deleuze locates the creative moment in the 'intervals between one linguistic combination and the next that generate the great events that fill these intervals, like the birth of a neck, the appearance of teeth, the formation of sex organs' (Deleuze 1997: 10). The syntactical body of writing is understood as undergoing a process of autopoiesis according to a self-generating, self-organising principle. The artist, the writer operates at the margins of identity-loss and silence in the field of an undetermined flux. This indeterminacy shows up in the variations and modulations of stuttering. The not yet articulated breaks forth as stutter since it has not yet recovered any linguistic structure or syntactical restrictions. But beyond that, style as stuttering grounded in delirium eventuates as a doubled-up movement, on its two levels, the level of word dissociation and syntactical dissolution, and its complex symptomatological level as trembling of language. That is to say, delirium demonstrates the forces of affectivity in pushing stuttering to its liminal position, the outside of language.

Style as stuttering draws together a whole canon of writers who are in fact critical-clinical symptomatologists.[9] The linguistic dynamism evoked within the critical-clinical exceeds the established equilibrium of language, and the disequilibrium created by symptomatologists can be described in terms of shaking, moving-fleeing, splitting and trembling, as varieties of modulation. Thus a whole range of symptoms beyond stuttering affords patterns of styles which combine to make up the sonorous qualities with different modulations.[10] Beyond this, the phrasing of language allows stuttering to eventuate forward and backward, two essential styles Beckett routinely enacts in his writings, as will be seen later. Patterns of the inner syntactical structure which contribute to the mechanics of stuttering are inclusive disjunctions and reflexive connections, that is, the expression encompasses double-layering in working in both senses (either *and* or) which disperses a logical progression such as happens in plot. Breathing is incorporated into stuttering and becomes a corporeal regulator of affect.[11] Beckett performs these procedures, according to Deleuze, to their full completion, exhausting all possibilities.

The symptom as a gesturing language

I now explore the final aspect of style as stuttering with regard to its function as liminal expression, and how the symptom may act as a gesturing language. If we follow Deleuze's definition of symptomatology as the transfer or transmission of the clinical observation, that is, the corporeal aspects, into the literary and artistic mode, then gesturing encompasses both sides of the double-sided critique: the bodily movement and its descriptive, expressive styling in the writing. Although the Deleuzian understanding of symptomatology is far removed from the psychoanalytic conceptualisation, there are some analogies which help to exemplify the processes.[12] Psychoanalytically read, the symptom presents itself in clinical terms as a coded message, not yet read in its signification, not yet deciphered in its address. Assuming that the symptom is addressed to someone, an answer or solution, a response or acknowledgement, is expected. The role of expectation in symptoms is decisive. Yet, at the same time, the functionality of the symptom is not yet comprehended, on either side, or the address is intentionally blurred, distorted or prevented. A symptomatological gesture can be understood in a multiplicity of ways since the symptom does not have any fixed agenda but is a processual mechanism of linking corporeality and mentality. Gesturing, then, may be understood as symptomatology

in action and performance. The symptom as a gesturing language can be creatively deployed as a linking mechanism. The psychoanalytic understanding of the symptom marks out the specificity of the Deleuzian symptomatological critique. In the psychoanalytic reading the symptom rises and appears when the language needed to express the underlying idea is lost, when the words are not accessible, for reasons of repression, and the syntax is not available. Circumvention over the bodily sign demands verbalisation from the other in the hope that the symptom might disappear. Within the psychoanalytic reading the symptom is grounded in transference and the contract with the analyst. Symptomatology in the Deleuzian sense does not accept the momentum of repression, or the mechanism of transference. As a positive expression of inner forces, as an immediate outpouring of delirium, the symptom carries in its gesturing the full original affect and thus can forego the demand for decoding or response.

I read the symptom as a gesturing language in terms of a moment of affective style in its own right. If the artist or writer operates at the margin of identity loss and silence, the symptom as gesturing attaches itself to the broken, stuttering syntax, the misplaced word, the catapulted or stuttered word. The symptom carries an unread message and indicates the broken exchange or communication but, more importantly, it also hints towards the encountered obstacles. Thus the symptom is indicator and hindrance of the expression, which makes it a schizoid mode; it is the gesturing momentum which integrates both, sign and barrier. Symptoms as a complex gesturing language, if we follow Deleuze, are to be understood as 'pre-individual, impersonal singularities' (Deleuze 2004a: 143).[13] While the delirium of the creative process engages with and propels the forces of affectivity towards the liminal position, the outside of language, symptoms – in our case exemplified by stuttering – as a corporeal and gestural mode of expression allow the lost linguistic terrain to be regained. Beckett's works, as will be seen, re-invent the unsayable by symptomatological gesturing.

III. Stuttering in Beckett as Liminal Expression

So far I have been concerned with elementary aspects of style as stuttering, the creative process as a delirium and the symptom conceived as a gesturing language. The creative act as a delirium and the gestural mode of symptom(s) can be grounded in exploring possible relations between symptom(s) and a Deleuzian reading of the unconscious which, however, goes beyond the frame of this paper. Both aspects, the delirious

and the gestural, set out symptomatology as a distinct mode to identify intensities and inner forces which support the critical-clinical as a distinct type of critique. A certain ground has also been laid for an understanding of style as stuttering in its multiple layers and levels, always with an eye to its usefulness for determining in which ways stuttering may function and embody the specific type of critique the critical-clinical attempts to achieve.

Symptomatology in literary texts

The exemplary literary symptomatology in Deleuze's analysis of masochism unfolds the specific critical-clinical apparatus and thus opens a way into understanding how the two levels of stuttering, the linguistic/syntactical and the complex symptomatological, relate and condition each other. In taking up literary texts such as Masoch's *Venus in Furs* (1870) and questioning the assumed (clinical, psychiatric) symptoms of masochism, the literary text reveals the functioning of inner, psychic processes, their manipulation in ritual and contractual patterns. Masochism develops a complex system of bodily displays of affects, mental control of suspense and self-discipline, thus making it possible to read the body-language in its symptoms as a balancing act between submission and refutation. It is this exercise of reading the symptoms in their corporeal, gestural and often paradoxical display which leads Deleuze to insert masochism into the larger frame of the critical-clinical. In Deleuze's understanding masochism has less to do with perversion than with delirium, a heightened affectivity as the core of literary creation in Masoch. The writer's performance of a diagnosis in the sense of a critical-clinical critique becomes his decisive stylistic mastery. By capturing the waves of inner forces, the literary text becomes a demonstration of delirium, accessing and expressing a zone between the unconscious, the not yet uttered, and their appearance in the literary text.

According to Deleuze, '(d)elirious formations are … the kernels of art' (Deleuze 1997: 54); they vary according to milieu and historical moments: 'Masoch's work … haunts the glacial zones of the Universe and the feminine zones of History'. The symptomatological apparatus of the critical-clinical is present in delirium, style as stuttering on both levels (syntactically and symptomatologically), affectivity, and a psychological trembling turned linguistic. Language at the deepest level stutters under the sway of affects and thus becomes the determining style. Suspension of bodies and the stammering of language become coordinated and are

inseparably fused in the style of writing, thus constituting the 'body-language, or the oeuvre, of Masoch' (Deleuze 1997: 55), which in turn is his specificity of style as stuttering symptomatologically understood. The symptomatological examination of Masoch's works parallels that of Kafka's and Beckett's. They are, in Deleuze's understanding, the great literary symptomatologists of life, culture, civilisation and society.

Each of these writers has specific linguistic/stylistic procedures. Progressive, enlarging dissociation of words and phrases (Deleuze 1997: 110) stands against expressions sprouting rhizomatically from the middle, pointing towards past and future (Deleuze 1997: 111). The process of dis-assembling the syntactical structure undercuts any possible time frame. In the extreme, these procedures lead to '*the outside* of language, but it is not outside it' (Deleuze 1997: 112; italics in the original). Thus Deleuze speaks of Péguy as being 'like a thwarted stutterer' using assemblages that belong to 'a superhuman stuttering'. Words accumulate through layering 'vertical thickness' (Deleuze 1997: 111) or a language block is dissociated through multiple, repeated bracketing inside the phrase, both linguistic strategies which allow affectivity to be gathered and demonstrated. The schizoid states of affectivity can be captured in these a-logical, a-syntactic variations. Rather than having a linear progressive syntax, Deleuze evokes 'curves, rings, bends, and deviations of th(e) dynamic line' (Deleuze 1997: 112). These procedures evoke forms of incantation through their routines of repetition and contraction, underlined by the patterns of sonority and breathing. I consider this liminal expression as it operates at the margin of what language can display before falling into silence.

Deleuze proposes that such a syntax is 'in the process of becoming, a creation of syntax that gives birth to a foreign language within language, a grammar of disequilibrium' (Deleuze 1997: 112). Extracting the writer's specific foreign language from the maternal language compares to extracting the 'unknown face of the event' (Deleuze 1997: 10). When speaking of reaching the liminal stage of the outside of language, Deleuze points to the confrontation with silence and it is the stutter which becomes the indicator for having reached the frontier of expression. The 'linguistic procedure' (Deleuze 1997: 19) as the material, symptomatological level of writing, in a paradoxical manner, eventuates in language, yet draws on what is impossible in language, (as yet) unsayable. 'The procedure pushes language to its limit, yet for all that it does not cross this limit. It lays waste to designations, significations, and translations –' (Deleuze 1997: 19–20; dash in the original). Stuttering as liminal expression, situated at the border of the sayable, employs

a schizoid mode/style and as symptomatological gesture lies at the core of the critical-clinical. The line-up of philosophical and literary symptomatologists, Masoch, Proust, Kafka, Nietzsche and Spinoza (Deleuze 1995: 142–3), points to some shared characteristics such as diagnostic intuition, resistance to their milieu and the impersonality of their vision.

> You write with a view to an unborn people that doesn't yet have a language. Creating isn't communicating but resisting. There's a profound link between signs, events, life, and vitalism: . . . Everything I've written is vitalistic, at least I hope it is, and amounts to a theory of signs and events. (Deleuze 1995: 143)

The critical-clinical as a type of symptomatological critique focuses on the realm between the body and its voicing in writing and thus grounds the writer's specific style. Voicing carries bodily affectivity in the form of symptoms into the writing whereby specific symptoms are of diagnostic character. While a diagnosis of life, culture, civilisation and society in the shape of observed, felt, experienced and remembered fragments is taking place, instantaneously – in the act of voicing in writing – the libidinal activity of creative delirium imaginatively transforms the raw material. Delirium as one of the defining aspects of style within the symptomatological critique of the critical-clinical, originating in the productive unconscious, overthrows the syntactical rules of established language and pushes towards a new, foreign language within language. Style as stuttering encompasses specific symptomatological linguistic procedures with distinct serialised formulas such as degrees of affective stutter (quiver, murmur) and breathing but more importantly the delineation of 'zone(s) of proximity, indiscernibility, or indifferentiation' (Deleuze 1997: 1).[14] The writer's activity of locating these unknown regions, spatially and temporally, then occupying and populating them, makes up the field of liminal expression in Beckett. Occupying may be understood here as creating situations and bodily positions including the repertoire of the gestural. Populating eventuates as a schizoid splitting of awareness, either in imaginary other(s) or in the natural process of division: 'Everything divides into itself' (Beckett 1983a: 168).[15] All potentialities – curving, ringing, bending, deviating and circulating of the dynamic propulsion of stuttering – have to be exhausted, which Deleuze conceptualises as 'Beckett's great contribution to logic': 'exhaustivity' (Deleuze 1997: 154). This parallels a Nietzschean kind of (necessitated) vital (as well as physical) degeneration which attaches itself to the profession of great symptomatologists.

Symptoms in Beckett

Solitude and isolation are presented as our existential predicament in Beckett's work, but there is at the same time a resilient yet mocking acceptance of suffering without ever giving in; life is handled energetically. This throws a specific light onto the processes of deterioration, the stages of exhaustion and decline, as they are an expression of the effort to stretch style to its utter limits. The symptoms of exhaustion lead to the limits of existence, yet they are not symptoms of resignation or defeat but gestures of provocation acted out with relentless bravado. Symptoms in Beckett can be read as the excessive, delirious and diagnostic elements of style as stuttering in the Deleuzian sense. The vocal and corporeal symptoms in the larval selves, as Deleuze defines them, are attuned to grey landscapes in which they harbour, in half-light, dimness or foreboding darkness. Loss of eyesight and blindness are not final or terminal hindrances but obstacles to be challenged. Corporeality is foregrounded in all its physicality and gives full reign to affectivity. The changing voiced impersonations are caught in either self-delusion or misrecognition, yet this only turns into a challenge to struggle on. Loss of mobility, vacillating, stumbling; malfunctioning of organs or partial decay of limbs are just minor obstacles to be overcome. Bodies are limping, falling, then crawling, and may collapse at any time, but will eventually, and repeatedly, stumble on. These bodily symptoms of inner forces urging towards change and metamorphosis take hold of the textual surface and make it tremble, thus effecting a stuttering in language.

Memory structures are uneven and often amnesia strikes. A continual flux of past experiences appears, interfering, superseding, receding and disappearing again, all of which makes up a libidinal field of affectivity traceable in the form of symptoms which twist and contort the syntactical performance so that style as stuttering in the Deleuzian sense is actualised. Memories splinter the awareness of the fragmentary selves, distract them, blur their consciousness; however, the competing voices hold on in a state of self-contradiction and confusion. There is an obsession with exploring the ever-changing self, whatever this self knows and remembers of itself, which colours the language and brings about the quiver or murmur which Deleuze theorises as a symptom of the inner forces breaking forth, and for which style as stuttering in the symptomatological mode within the critical-clinical hypothesis sets the appropriate frame of critique. There are younger and older selves, living a schizoid presence in the same body, contradicting

each other, superseding each other, acting out and performing a becoming.

Drawing on the symptomatological mode of the critical-clinical, I read the larval selves in Beckett's work as successive, fleeting embodiments which undergo a continuous metamorphosis. The desire for becoming other is perpetually renewed; this opens the path into reading Beckettian symptomatology. At times, the selves are preliminary projections of the same self, foreshadowing future stages of becoming. The self is reduced, stripped and pared down to essential characteristics, or rather, read in the Deleuzian sense, affects. It is a shifting assemblage of symptoms. Desire propels them forward, makes them act and pursue their indefinite, endless and backtracking journeys. Thought and language are compressed to a double-sided, folded unity in Beckett. What appears as syntactical dissolution points to a flux of libidinal affects in the Deleuzian sense and stuttering in language as a creative activity in the process of inventing a new, foreign language. Voices are competing with each other, and we might ask whose voices they are and from where they originate. Voices babble, chatter and prattle along and at times forget continuity so as to fall back into an earlier stage of reminiscence and repetition.

Beckett's texts express the inner chaos of creative delirium and stutter is its inherent characteristic. I situate spatiality and temporality in these texts on a mythic, or, in Deleuzian terms, on an Aionic plane; in the liminal state they become inexistent or are remotely important. The selves pursue trajectories of uncertain destinations, are always in midway, in-between movements or journeys which are either circular or linear, or both. Yet they do not recognise or notice the difference, and often wilfully and ironically equate both, with ensuing disorientation of movement which takes them through a void or endlessness. '(Y)ou must go on, I can't go on, you must go on, I'll go on, you must say words, as long as there are any' (Beckett 1983a: 381).[16] Exhaustion, fatigue and deflation of energy overtake them, yet there is boundless libidinal energy underneath, and eventually they rise and continue.

Stuttering as liminal expression

Turning towards the Beckettian form of liminal expression within the frame of the Deleuzian critical-clinical involves practising a symptomatological method of exhaustivity as theorised by Deleuze. Within such a frame, stuttering as an exemplary symptom is taken

through different levels of metalanguages (I, II, III) which are identified as specific Beckettian symptomatological techniques (Deleuze 1997: 156 [I]; 156–8 [II]; 158–62 [III]). While there are other possibilities than exhaustion to anchor symptomatological methods, a Deleuzian reading of exhaustion as the linguistic, affective and delirious situation of Beckett as a symptomatologist-writer opens a path into the blend of exhaustion and resilience of Beckett's works. Exhaustion does not point to tiredness, fatigue, or depletion of energies; quite the contrary: 'The tired person has merely exhausted the realization whereas the exhausted person exhausts the whole of the possible' (Deleuze 1997: 152), thus demonstrating a relentless Spinozism. This type of already achieved completion finds its pithy expression in Beckett as: 'I gave up before birth.' Any activity is directed towards nothing while remaining full activity; the idling in nothing effects, produces the symptom, which is an inclusive-disjunctive yet consumptive-consummative exhaustion. Linguistically detectable as the stuttering double-bind of inclusive disjunction (either *and* or), exhaustion symptomatically displays itself in bizarre repetitive rituals such as Molloy rotating sucking stones through the corridors of mouth and pockets (Beckett 1983a: 64–9), or Murphy's combinatorial games with five biscuits in all their permutations (Beckett 1974: 57 ff.).

Beckettian metalanguage I, as theorised by Deleuze for a critical-clinical critique, can be conceptualised as symptomatological exhaustion detectable on an elementary level: 'a language in which enumeration replaces propositions and combinatorial relations replace syntactic relations: a language of names' (Deleuze 1997: 156). Brief spurts of stuttering progressively withdraw meaning while at the same time pursuing a growing precision in the act of naming. 'Minimally less. No more. Well on the way to inexistence. As to zero the infinite. Quick say' (Beckett 1981: 54). Metalanguage I is still concerned with naming, finding and directing words at situations; already fragmented and restrained from connecting, these blocks of stuttering attenuate any hold on reality. Syntactical irregularity, agrammaticality, can deliver a dispersion and disconnection of words and things, of words and actions, and speech acts and words. Such a schizoid practice can be further refined in dislocating the wording as such, taking the level of affectivity back into the body, to a pre-linguistic level of voicing and breathing. This is already indicated in the above example in the finishing clue: 'Quick say'.

Beckettian metalanguage II, within Deleuze's critical-clinical critique, projects symptomatology as a mode to identify intensities and inner forces; on this level, style as stuttering comes into its own right with the writer becoming a stylistic, intensive and affective stutterer. Enumerating

things could reach a certain degree of exhaustion and relative liminality. Yet taking language back to its margins and into the pre-linguistic domain of voices, breathing, stuttering and murmuring breaks another barrier of exhaustion. Words stream and flow but under the sway of libidinal forces; they do not cohere, or do so to a lesser degree. Meaning is dispersed; affectivity reigns and silence can become the ultimate statement, apparent in open-ended, aporetic phrases and typographic blanks.

> this voice once quaqua then in me when the panting stops part three after Pim not before not with I have journeyed found Pim lost Pim it is over I am in part three after Pim how it was how it is I say it as I hear it natural order more or less bits and scraps in the mud my life murmur it to the mud (Beckett 1964: Part I, 21)

The rhythm of breathing and lowered voicing, murmuring, replaces any punctuation indicating a conscious syntactic regulation. There is a threshold to be crossed between the impersonations, '| not with || I || have journeyed |'[17] which creates a hiatus, an expressive flow forward and backward in language leading to a symptomatological stuttering of the text. At these moments affect breaks through in its immediacy. Within this schizoid milieu, voices start competing with and battling against each other: the transit stages of becoming are overlapping. Circuits of linguistic and symptomatological transformations coexist and overlap evoking the presence of apparent remnants or larvae of personae, yet obviously being part of the same voice.

> no nothing I said nothing I say it as I hear it I said always brief movements of the lower no sound Pim's voice in my ear that I'd have it always and life above not possible otherwise our little scenes blue by day always fine a few fleece clouds the stars by night heavenly bodies never dark ad libitum confidential between ourselves secrets a murmur always and what is more in my opinion I hear it such a question I murmur it my opinion such a question never crossed never could my mind such a doubt my opinion I hear it murmur it never never
>
> in a word Pim's voice then nothing life as we say little scene one minute two minutes good moments then nothing even better not a doubt Kram waits one year two years he knows us something wrong there but all the same two years three years in the end to Krim they are dead something wrong there (Beckett 1964: Part II, 102; paragraph break in the original)[18]

The bi-directional fluctuations, for instance in '|| no sound || Pim's voice in my ear |', effect paradoxical utterances of a schizoid nature. Locating the voice apparently becomes difficult if not impossible. It is either the deeper murmur of memory or the voiced murmur of the larval subject, or

rather in a Deleuzian reading of style as stuttering, both simultaneously. Although the text typographically establishes a progression, the event of the voicing separates itself from any temporality. The effect of stuttering takes place on the textual surface, however, at the same time, since the text moves between several layers (the present outer action, the inner vocal level, descending, the memory ascending, the self-questioning, the reflective level) stuttering in language results from crossing the thresholds of these linguistic layers. Repetitions establish a moment of silence, a halting which is typographically evoked in paragraphing. Further impersonations (I and Pim, now Kram and Krim) crop up which provoke a conscious, mocking, echoing commentary: 'something wrong there'.

Once the level of things and the level of words are attenuated in the process of progressive exhaustion and nearing their ultimately possible liminal expression, what are the promises that, according to Deleuze's symptomatological critique, Beckettian metalanguage III holds in store? Here is a symptomatological example from Beckett's later writing:

> Worse less. By no stretch more. Worse for want of better less. Less best. No. Naught best. Best worse. No. Not best worse. Naught not best worse. Less best worse. No. Least. Least best worse. Least never to be naught. Never to naught be brought. Never by naught be nulled. Unnullable least. Say that best worse. With leastening words say least best worse. For want of worser worst. Unlessenable least best worse.
> [. . .]
> The empty too. Away. No hands in the–. No. Save for worse to say. Somehow worse somehow to say. Say for now still seen. Dimly seen. Dim white. Two dim white empty hands. In the dim void.
>
> So leastward on. So long as dim still. Dim undimmed. Or dimmed to dimmer still. To dimmost dim. Leastmost in dimmost dim. Utmost dim. Leastmost in utmost dim. Unworsenable worst. (Beckett 1983b: 32–3)[19]

The voice is caught in an inner vortex of affectivity with little reasoning, in a sway of untiring exhaustion, 'no', 'no', 'no', yet determined to come to terms with the dim void it finds itself in, even though it cannot understand how it got there in the first place and never hopes to get out of it. There are, however, attempts of saying and seeing, and a maddening libidinal energy which reaches out for words only to dissect them and grind them down to the core: 'To dimmost dim. Leastmost in dimmost dim. Utmost dim. Leastmost in utmost dim.' The energy comes in waves like a tide and returns with unbeatable strength. Despite the linguistic repetitiveness and the dreary conditions of dimness of light (and of consciousness) and vastness of the void, the loneliness,

the general emptiness and the apparently endless continuity, there is a remarkable endurance and quirkiness which mocks itself in its cauldron of life.

The textual fabric vibrates under such insisting repetition and recurring formulas. The level of intensity can be heightened and gain momentum in frantic panting which is less a linguistic than a breathing performance, or both in even parts.

> alone in the mud yes the dark yes sure yes panting yes someone hears me no no one hears me no murmuring sometimes yes when the panting stops yes not at other times no in the mud yes to the mud yes my voice yes mine yes not another's no mine alone yes sure yes when the panting stops yes on and off yes a few words yes a few scraps yes that no one hears no but less and less no answer LESS AND LESS yes (Beckett 1964: Part III, 160; capitals in the original)[20]

Deleuze conceptualises Beckett's further attempts at approaching the outside of language in proposing 'a (Beckettian) *language III*, which no longer relates language to enumerable or combinable objects, nor to transmitting voices, but to immanent limits that are ceaselessly displaced – hiatuses, holes, or tears that we would never notice' (Deleuze (1997: 158). Such a language with its ceaseless displacements of thresholds – if it still can be called a language rather than a nonlanguage – could master symptomatological stuttering as liminal expression. It could be the linguistic medium to express the inner libidinal forces as they arise, fade and re-appear and thus be a symptomatological instrument of becoming. This deeper symptomatological level can be conceived in terms of 'Image, a visual or aural Image, provided it is freed from the chains in which it was bound by the other two languages' (language I and II) (Deleuze 1997: 158); 'Images' such as fleeting colours (dim white, a little blue) and bodily parts (a hand, a mouth, eyes), not attached to memories or inventing stories. Since '(t)he image is not an object but a "process"' (Deleuze 1997: 159), it fluctuates in the form of visual and aural 'ritornellos' (Deleuze 1997: 159–60) which are at times supported by 'motor ritornellos' (Deleuze 1997: 160) in the form of postures, positions held and shifted routinely, and specific Beckettian 'gaits': 'The boots. Better worse bootless. Bare heels. Now the two right. Now the two left. Left right left right on. Barefoot unreceding on' (Beckett 1983b: 23–4). Beckettian metalanguage III encompasses a system of symptomatological exhaustion where step by step the barriers of language are overcome, in unlimited enumeration (I), in silencing voices (II), and in contracting

images and space (III), where stuttering as symptom traces the libidinal intensities and the schizoid style as liminal expression marks a transit stage in the process of becoming.[21]

IV. Conclusion

This paper has explored the possibility of drawing together the critical-clinical as a type of critique, symptomatology as a mode to identify intensities and inner forces, and a range of exemplary symptoms such as stuttering which embody the specific type of critique the critical-clinical hypothesis attempts to achieve. Style as stuttering has been demonstrated as a specific form of literary expression and an apt and appropriate way to evoke the process of becoming as theorised by Deleuze, linguistically, syntactically and symptomatically. Within such a process, excess, delirium and diagnosis function as an accumulative set of stylistic criteria to define symptomatological stuttering. In the specific case of Beckett, stuttering in language has been shown as opening access to a schizoid style of liminal expression, in particular in a form of exhaustivity which, read in the Deleuzian sense, is of a positive nature.

Further questions which arise within the frame of exploring the schizoid style of liminal expression, but which reach beyond the scope of this paper, go towards the relations between style as stuttering with its levels of excess, delirium and diagnosis, and establishing the affective network of the Deleuzian body without organs, and whether stuttering can be named a proper language of the BwO.

Notes

1. Deleuze refers to Spinoza, *Ethics*, III, 2, Proof: 'I have already shown that they know not what a body can do, or what can be deduced from mere contemplation of its nature, and that they have known of many things which happen merely by reason of the laws of nature, which they have believed to happen save by the direction of the mind' (cited in 'The Body', section 'Active and Reactive', Deleuze 1983: 36–7; note 1: 192). In the section 'Active and Reactive', Deleuze foregrounds 'The Body' (and how it relates to the unconscious) by contrast to consciousness. In his preface to the English translation of *Nietzsche and Philosophy* Deleuze points to the two great axes of organisation of Nietzsche's philosophy; the first axis concerned with forces forming a general semeiology (*sic*), devoted to the analysis of 'signs, or rather symptoms' (Deleuze 1983: ix); the second axis concerned with power forming an ethics and an ontology. Cf. Deleuze 1992: 217–34. Deleuze analogously refers to Nietzsche, *The Will to Power* (1968: 659): The human body is 'a more astonishing idea than the old soul' (Nietzsche 1935/1937: VP II, 173); 'What is most surprising is rather the body; one never ceases to be amazed at the idea that the human body has become possible' (Nietzsche 1935/1937: VP II, 226). Cf. Rajchman (2000) for Deleuzian

connections (Spinoza, Hume, Bergson, Nietzsche, Whitehead); esp. Chap. 6: 'Sensation' (113–42), providing an outline of Deleuzian aesthetics; for further cross-connection, see Williams (2005).

2. Cf. Deleuze (2006: 16, 20, 32, 38, passim). Deleuze draws in his comments on masochism on Krafft-Ebing [1886]; Reik [1941/1949]; Freud [1905]; and Lacan [1963]. The chapters dealing with the language of Sade and Masoch, the contract in masochism (Chap. 1) and the role of descriptions (Chap. 2), attempt to free symptomatology from any pre-defined masochism. 'The sadomasochistic entity was not invented by Freud; we find it in the work of Krafft-Ebing, Havelock Ellis and Féré' (Deleuze 2006: 38). Cf. also Deleuze 2004b.
3. Cf. in Deleuze (1997): essay 1 [1993], 'Literature and Life'; essay 2 [1970], 'Louis Wolfson; or, The Procedure'; essay 3 [1986], 'Lewis Carroll'; essay 7 [1989], 'Re-presentation of Masoch'; essay 10 [1993], 'Bartleby; or The Formula'; essay 11 [1993], 'An Unrecognized Precursor to Heidegger: Alfred Jarry'; essay 13 [1993], 'He Stuttered'; and essay 18 [1992] 'The Exhausted'. Cf. Smith (1997; 2005) for different takes on the notion of the critical-clinical.
4. The Deleuzian understanding of empiricism (wilder empiricism, *not* simple empiricism, transcendental empiricism) cannot be addressed in the frame of this paper. Cf. 'There is something wild and powerful in this transcendental empiricism that is of course not the element of sensation (simple empiricism), for sensation is only a break within the flow of absolute consciousness' (Deleuze 2002: 25).
5. 'Kant owes something essential to Hume: we are not threatened by error, rather and much worse, we bathe in delirium' (Deleuze 2002: 43; cf. also 41–3, 45). The three essays in Deleuze's final work (his testament, and essays on Hume and Nietzsche) set out a final vision of delirium. The creative process defined in Deleuzian terms as a delirium is grounded in the notion of phantasm as explored in 'Thirtieth Series of the Phantasm' in *The Logic of Sense* (Deleuze 2004c: 241–9).
6. Cf. Massumi (2002) and Engelberts et al. (eds) (2000) for affectivity in Deleuze and in Beckett.
7. Cf. Deleuze and Guattari (2004a: 1–9; 38–45); cf. also Buchanan (2000; 2008).
8. Deleuze and Guattari's collaborations in *Anti-Oedipus* [1972] and *A Thousand Plateaus* [1980] introduce into the Deleuzian critical-clinical hypothesis a positively understood schizophrenisation and a notion of machinic desire which complicates and differentiates the critical apparatus. The symptomatological method accommodates the relational ideas of the threefold syntheses of the unconscious, thus acquiring a logical structure yet straining its visionary layers. I propose that in the initial critical-clinical hypothesis the subject can be viewed as losing its status in the process of becoming and is only traceable in its symptoms. In the process of schizophrenisation, however, as one of the folds of becoming, the subject can be viewed as operating at the limits of bodily existence between delirium and catatonia. So, the refinement of the symptomatological method as far as it can here be drawn in this paper, opens towards viewing bodily symptoms not just in terms of affectivity and inner (Nietzschean) forces but more specifically as the operation and functioning of desiring-machines. As will be seen later, this conceptual move towards a threefold mechanics in desiring-production (connection – inclusive disjunction – consumption/consummation) has repercussions in Deleuze's understanding of symptomatological stuttering with which I will be engaging in the transposition of the critical-clinical into Beckett's work. Cf. Gendron (2008) for a view of Deleuze and Beckett (as well as Derrida) and Murphy (2000); for Beckett, see Hill (1990) and Trezise (1990).

9. As critical-clinical symptomatologists figure: Masoch, Kafka, Beckett, Péguy, Roussel, Artaud and Céline. Cf. Deleuze (1997) and Deleuze and Guattari (2004a; 2004b).
10. On patterns of styles combining sonorous qualities with different modulations, cf. for instance: 'Twelfth Series of the Paradox', 'Thirteenth Series of the Schizophrenic and the Little Girl' (Artaud and Carroll), 'Third Series of the Proposition', 'Thirtieth Series of the Phantasm', in *The Logic of Sense* (Deleuze 2004c). Cf. Williams (2008) for a critical guidance through a challenging text.
11. It is important to acknowledge here that these symptomatological procedures of the clinical-critical are analogous to the operation and functioning of desiring-machines. The threefold operation of desiring-machines: connection – inclusive disjunction – consumption/consummation, is theorised in Deleuze and Guattari (2004a: 1–57).
12. Laplanche and Pontalis, in their work on Freudian (and Lacanian) terminology, state that symptom-formation denotes 'the fact that the psychoneurotic symptom is the result of a specific process, of a psychical working out'. Freud 'assimilates symptom-formation to the return of the repressed'. It is uncertain whether these are two separate processes. 'In a broad sense symptom-formation embraces not only the return of the repressed in the form of "substitutive formations" or "compromise-formations" but also "reaction-formations"' (Laplanche and Pontalis 2006: 446).
13. Symptoms as a complex gesturing language also manifest in other ways. By contrast to style defined by Deleuze as singularity, an event, in symptoms the emphasis is on their pre-individuality and impersonality while eventuating. Cf. 'Gilles Deleuze Talks Philosophy', an interview conducted by Jeanette Colombel (first published in *La Quinzaine Littéraire* 68 (Mars 1–15, 1969), pp. 18–19, hence situated after the publication of Deleuze's double theses [*Difference and Repetition* and *Spinoza and the Problem of Expressionism*] and just before the publication of *The Logic of Sense*), in which he defines the speaking position of today's writer (as philosopher, as literary writer, as artist) as that of someone speaking 'as someone else': 'These singularities are mobile, they break in, thieving and stealing away, alternating back and forth, like anarchy crowned, inhabiting a nomad space. . . . The poet Ferlinghetti talks about the fourth person singular: it is that to which we try to give voice' (Deleuze 2004a: 143).
14. Cf. 'Louis Wolfson; or, The Procedure' (in Deleuze 1997: 7–20; first published as the preface to Wolfson 1970: 5–23, under the title 'Schizology', here revised); and 'Bartleby; or, The Formula' (in Deleuze 1997: 68–90).
15. Deleuze counts the internal division as one of Beckett's 'exhaustive series', executed for instance in clothes, furniture, body positions and perspectives (cf. Deleuze 1997: 152–74; 154; note 11: 202). Cf. also Murphy 2000: 233–4.
16. The concluding words of *The Unnamable* [1952] read: 'they're going to abandon me, it will be the silence, for a moment, a good few moments, or it will be mine, the lasting one, that didn't last, that still lasts, it will be I, you must go on, I can't go on, you must go on, I'll go on, you must say words, as long as there are any, until they find me, until they say me, strange pain, strange sin, you must go on, perhaps it's done already, perhaps they have said me already, perhaps they have carried me to the threshold of my story, before the door that opens on my story, that would surprise me, if it opens, it will be I, it will be the silence, where I am, I don't know, I'll never know, in the silence you don't know, you must go on, I can't go on, I'll go on' (Beckett 1983a: 381–2).
17. For metalanguage II where punctuation (as conscious syntactic regulation) is abandoned I propose a range of typographical descriptors to capture: 1. the rhythm of breathing and lowered voicing, murmuring, by a vertical slash (|); 2.

the event of threshold crossings between impersonations creating a hiatus and a bi-directional fluctuation by a double vertical slash (||); 3. the persistence of the (interrupted) word stream and flow under the sway of libidinal forces by underlining (_):

> this voice | once quaqua | then in me | when the panting stops | part three | after Pim | not before | not with || I || have journeyed | found Pim | lost Pim | it is over | I am in part three | after Pim | how it was | how it is | I say it | as I hear it | natural order | more or less | bits and scraps | in the mud | my life | murmur it to the mud (Beckett 1964: Part I, 21).

18. I am using the typographical descriptors 1, 2 and 3 as indicated in note 17. I propose a further typographical descriptor: 4. for the conscious, mocking, echoing commentary eventuating in both blocks of stuttering (*in italics*):

> no nothing | I said nothing | I say it as I hear it | I said | always brief movements of the lower || no sound || Pim's voice in my ear | that I'd have it always || and life above not possible otherwise | our little scenes | blue by day | always fine | a few fleece clouds | the stars by night | heavenly bodies | never dark || ad libitum confidential between ourselves || secrets || a murmur always | and what is more | in my opinion | I hear it | such a question | I murmur it | my opinion | *such a question never crossed* || never could || *my mind* | such a doubt | my opinion | I hear it | murmur it | never never
> in a word | Pim's voice | then nothing | life as we say | little scene | one minute | two minutes | good moments then nothing | even better || not a doubt Kram waits one year | two years | he knows us || *something wrong there* || but all the same | two years | three years | in the end to Krim they are dead || *something wrong there* || (Beckett 1964: Part II, 102; paragraph break in the original).

19. A different linguistic regime is deployed in the form of libidinally propelled bursts of stutter which are repeatedly turned around, dissected and voided. I am using the typographical descriptors 3 and 4 as proposed in notes 17 and 18:

> Worse less. By no stretch more. Worse for want of better less. Less best. No. Naught best. Best worse. No. Not best worse. Naught not best worse. Less best worse. No. Least. Least best worse. Least never to be naught. Never to naught be brought. Never by naught be nulled. Unnullable least. *Say* that best worse. With leastening words say least best worse. For want of worser worst. Unlessenable least best worse.
> [. . .]
> The empty too. Away. No hands in the -. No. Save for worse to say. Somehow worse somehow *to say*. *Say* for now *still seen. Dimly seen. Dim white*. Two *dim white* empty hands. In the dim void.
>
> So leastward on. So long as dim still. Dim undimmed. Or dimmed to dimmer still. To dimmost dim. Leastmost in dimmost dim. Utmost dim. Leastmost in utmost dim. Unworsenable worst. (Beckett 1983b: 32–3).

20. I am using the typographical descriptors 1 (rhythm of breathing and murmuring), 2 (hiatus and bi-directional fluctuation) and 3 (libidinal persistence) as explained above. The capitalised commentary appears in the original text:

> alone in the mud yes | the dark yes | sure yes | panting yes | someone hears me | no | no one hears me | no | murmuring sometimes yes | when the panting stops yes | not at other times no | in the mud yes | to the mud yes | my voice yes | mine yes | not another's no | mine alone yes | sure yes | when the panting stops yes

> | on and off yes | a few words yes | a few scraps yes | that no one hears no | but less and less no || answer LESS AND LESS yes (Beckett 1964: Part III, 160).

Symptoms of a New Politics: Networks, Minoritarianism and the Social Symptom in Žižek, Deleuze and Guattari

Andrew Robinson University of Nottingham

Abstract

This article explores the contemporary 'symptomatic' position of radically excluded social groups through a critical engagement with the work of Žižek, Deleuze and Guattari. It begins with a presentation and critique of Žižek's theorisation, arguing that while he correctly perceives the symptomatic status of certain social groups and issues, his approach is insufficiently radical because of its reliance on inappropriate structuralist assumptions and metaphysical negativity. It then compares this theory to Deleuze and Guattari's theory of minoritarianism, viewed as a similar attempt to engage with the symptomatic effects of exclusion. A political trajectory is derived from Deleuze and Guattari's theory which reconceives the politics of the excluded in terms of emancipatory lines of flight rather than gestures of identification. The article then explores social movements arising from the growing phenomenon of global exclusion in neoliberalism, looking at examples such as Somalia and Bolivia, and proposing autonomy and networked approaches to social life as responses to exclusion which reconfigure social space in affirmative ways.

Keywords: social symptom, social exclusion, autonomous social movements, minoritarianism, forcible delinking, schizoanalysis, politics of desire, network politics, Somalia, Lacanian Real, Žižek, absolute deterritorialisation.

The concept of the 'social symptom' takes on a new life when cross-read with the work of Deleuze and Guattari. This concept, derived from the work of Slavoj Žižek, applies Lacanian ideas to social analysis in a way that gives central importance to the excluded in formulating political radicalism, and that provides major insights into the contemporary world. In its current form, however, it is shaped and limited by the perspectival frame within which it is formed. Shifting the concept from the Lacanian frame into a Deleuzian frame opens up alternative avenues for linking it to other resonant issues such as the growth of the network form of political activism and the breakdown of systemic power in extremely marginal regions. By linking the concept to a reconstruction of the Lacanian Real as a misinterpretation of sites of excessive potentiality by the dominant gaze, a Deleuzian reading of the social symptom can connect the concept to possibilities for autonomy beyond those made apparent in existing inscriptions of the concept. Hence, it is important to explore the limits placed by the Žižekian/Lacanian ontological frame on the concept of the social symptom, and to suggest that it can be enriched by a cross-reading with various aspects of the work of Deleuze and Guattari, including ideas of minoritarianism, lines of flight, active desire and rhizomatic networks. While Lacanian psychoanalysis has a clear appreciation for the importance of excluded groups in the ideological or fantasmatic field, its methodological conservatism regarding the question of the primacy of the negative leaves it unable to formulate an affirmative politics of the excluded. Deleuzian theory, in contrast, provides a possible frame for thinking about issues around autonomous social movements and network politics. In previous collaborative work, I have explored in detail the implications of Deleuzian theory for the analysis of social movements, states and power in the contemporary situation (Karatzogianni and Robinson 2010). This paper expands on the analysis developed in this earlier work to theorise the relationship between Deleuzian theory and the concept of the 'social symptom'. In doing so, it provides not simply a Deleuzian critique and appropriation of Žižek, but also the outlines of a way of actualising Deleuzian praxis in the construction of autonomy.

I. 'We Are All Them'? The Social Symptom in the Work of Slavoj Žižek

The role of the social symptom has to be understood in relation to the importance of fantasmatic or ideological construction in the production

of dominant neurotic forms of social order. Lacanian theory echoes the Althusserian theory of ideology. In Althusser, ideology is not a misrepresentation of reality, but the real performative ways in which people relate to the actual conditions of their existence (Althusser 1970). How people relate ideologically to the dominant order thus strongly influences social stability and composition. In this problematic, the collective ideology or fantasy of a dominant social order can be viewed in psychoanalytic terms. Hence, Žižek views society as homologous to the Lacanian model of the psyche, containing a Symbolic (formal institutions), an Imaginary (the field of Althusserian ideology) and a Real, a part which is 'extimate' to (intimately present in but treated as external to) the system.

Žižek's politics apply homologically the structural categories of Lacanian analysis. In psychoanalysis properly speaking, the symptom is the point at which repressed or excluded aspects of the self associated with the Lacanian Real 'return' in the form of emotional intensities, actions and experiences which are incomprehensible to and rejected by the conscious mind. The symptom thus becomes a source of intense unconscious enjoyment while also being consciously rejected and hated as uncontrollable. Identification with the symptom (or in an earlier phase of Lacan's thought, traversing the fantasy) is crucial to the process of psychoanalytic cure as it is only by overcoming the exclusion of these elements that the personality can escape its entrapment in its current fantasmatic field, becoming capable of speaking the truth of one's desire (Solano-Suárez 2007).

The social symptom arises from a hierarchical construction of meaning similar to Deleuzian arborescence. Crucial to this view of society is the function of the 'master-signifier', reconfigured in Deleuzian theory as the despotic signifier or 'trunk' (in terms of its relationship to state despotism on the one hand and arborescence on the other). The master-signifier functions by 'quilting' or 'suturing' the symbolic field, creating an appearance of order by repressing or excluding the Real, and hence excluding contingency, incommensurability and incomprehensibility from social life. Hence, 'the master signifier is responsible for the conscious effects of the unconscious fundamental fantasy', for creating the subject's apparently orderly cosmological perspective (Brockelman 2008: 24). This exclusion is partial and precarious, and the Real necessarily returns to haunt the social formation. Hence, the violence of the establishment of the master-signifier must constantly be re-enacted. One can term the perspective constructed around a master-signifier the *dominant gaze*.

The social symptom is the structural equivalent in the social field to the symptom in the psyche. At some point in society, there is a 'symptomal torsion', and an authentic Act necessarily intervenes at this point (Butler, Laclau and Žižek 2000: 125). Following Badiou, Žižek argues that the social symptom is the void or gap in the situation (Žižek 1999: 138–40). The groups comprising the social symptom are 'the part which, although inherent to the existing universal order, has no 'proper place' within it' (Žižek 1999: 224). The crucial Žižekian concept of the Act is closely linked to the social symptom. The underlying social fantasy depends on the status of the social symptom. Hence, an authentic Act 'disturbs the underlying fantasy, attacking it from the point of the 'social symptom'' (Butler, Laclau and Žižek 2000: 124). This is the way to get around blockages arising from the dominant ideological constellation. Radical politics is rendered impossible by the dominant fantasy-frame, but can be recovered from the point of the excluded (Butler, Laclau and Žižek 2000: 125).

Acts have a number of characteristics, such as self-destitution and dogmatic ungrounded violence, but the crucial feature distinguishing true and false Acts is their relationship to the social symptom (see Robinson and Tormey 2005). A true Act, the authentic revolutionary gesture for Žižek, involves identifying with the social symptom. To identify with the symptom is to locate and identify with the 'part of no part' in society, the group which is necessary to society but excluded from it (Žižek 1999: 231). Politically, this involves taking a stance which is deemed unthinkable in the dominant social order (Žižek 2000: 156–7). Žižek calls for action from the standpoint of (hence, not necessarily by) the excluded, 'from the standpoint of this inherent impossibility' which is the disavowed structuring principle of society, and addressed to the excluded (Butler, Laclau and Žižek 2000: 123, 125). Hence, it is the discursive construction of an Act, not its concrete relationship to the excluded, which characterises it as authentic. Its effect is a kind of internal transformation. By identifying with the symptom, one becomes a 'proletarian', or 'touched by grace' (Žižek 1999: 173, 227).

While it exists structurally in every situation, the social symptom varies in terms of which group occupies the structural position. Although Žižek insists there is only one touchy nodal point in each fantasmatic order (Butler, Laclau and Žižek 2000: 125), his writing generates a whole field of 'social symptoms', from Sarajevans under bombardment and Muslims after 9/11 through to the urban poor. These might be symptoms of different situations or ideologies in a single global order, or else inconsistencies in Žižek's construction of the concept. Most

often, the social symptom is identified with the excluded. At one point, Žižek talks about a social stratum of the Real composed of various systematically disempowered groups such as unemployed people, homeless people, disadvantaged ethnic groups and undocumented migrants (Butler, Laclau and Žižek 2000: 323). At another point, unemployed people are identified as a kind of nodal point (Žižek 2001: 19). At other points, the proliferation of violence in social life, from urban revolts to the war in Bosnia, is taken as symptomatic of the Real of the liberal order and its disavowal of conflict (e.g. Žižek 2005).

Žižek is onto something important with his concept of the social symptom. The role of an excluded Real in reactive identity-formations is widely documented. A number of authors in the fields of conflict studies and poststructuralist international relations theory have emphasised the importance of discourses of exclusion in the construction of conflict (Jabri 1996, Benhabib 1996, Campbell 1999, Khan 1996, Edkins 2003). For instance, Kapferer's study of Sri Lankan nationalism suggests that ethno-religious identity emerges through the identification of social reality with a particular fantasy-frame. In the Sri Lankan case, state integrity is framed as essential to personal integrity, and hence the Tamils are viewed as a threat not only to the state but to the nationalist individual (Kapferer 2001). This echoes claims made by psychoanalytic scholars of fascism. Authors such as Theweleit (1987) show the importance of fear of disintegration in the construction of predatory identities such as those of fascism. Fear of ego-dissolution is prior to actual violence by or against the Other, expressing anxieties around masculinity and submersion in the mass. The Other is assigned a social-symptomatic status to enable an acting-out of violence which reassures the self of personal and collective integration. Similarly, Renata Salecl argues that hate-speech and prejudicial violence put the Other in her or his place so that the self can feel secure in her or his place (Salecl 1998: 120–1). Hence, the Other as 'social symptom' is crucial to the functioning of exclusionary ideologies.

The issue is complicated today by the ways in which arborescent frames are disrupted by global networks. If arborescent order is associated with the state, one can see its Real returning in the proliferation of networks. The state is being outflanked by networks, and might never catch up (Sassen 2006: 327). Since the state cannot dominate social flows, and can recognise them only at the expense of losing its 'stateness' or monopoly claims to power, the state wages a permanent war against forces which exceed and escape it (Castells 1997: 302–3). This loss of power is at the root of the dangerously extreme

assertions of sovereignty exposed by Agamben (1998, 2005). At an ideological level, the loss of state power leads to deep insecurities of arborescent identities. Political geographer Colin Flint and discourse analyst Michael Innes have shown that the geopolitical imagination is haunted by the dissonance between the world of states and the threat of 'deterritorialised, transnational social networks that overlay them' (Innes 2008). Such fears are mapped onto minorities and marginal groups as bearers of mobility, transnational flows and the gap between majority and totality. Arjun Appadurai shows that there is a clear relationship between insecurities arising from neoliberalism and anti-minority violence (Appadurai 2006: 83–4). '[M]inorities are the flash point for a series of uncertainties that mediate between everyday life and its fast-shifting global backdrop' (Appadurai 2006: 44). While the parallel is not drawn in Žižekian theory, it seems clear that the social symptom arises at the point where networked flows exceed systemic inscription, and resulting insecurities are mapped onto social out-groups.

Hence, networks and everyday life can be mapped as sites of disorder in a context where statist reason is haunted by network power, and become sites of potential collapse of such power. The social symptom is thus crucial in understanding the failure of processes of crisis management through which the dominant system seeks to ward off uncertainty. To take an example, François Debrix aptly analyses peacekeeping interventions in terms of insecurities arising from discontents of the New World Order. Echoing Lacanian theories of the return of the Real, Debrix views situations such as the Somali civil war as creating images of disorder which are disruptive of images of integration. In this context, intervention is performed as 'visual simulation' to create the appearance of order (Debrix 1999: 97–9). It is assigned a role of closing reality around 'a safe and certain identity' and a related system of meaning which constructs neoliberalism as the end of history (99). Intervention thus bridges the gap between the vision of order and the rhetorical reality of breakdown, providing a suture (107, 111). In Somalia, it failed to do so because the intervention was unable to create narrative closure. Instead, images arising from peacekeepers' failure began to disempower, deactivate and disarticulate the dominant ideology (126). Suture failed because what should be lacking instead appeared in excess (131). One can see this return of the repressed as arising from the density of Somali social reality due to the intensity and complexity of social networks. We shall return to the case of Somalia below.

Hence, the concept is useful in making sense of contemporary conflict. On the other hand, there are difficulties with how Žižek deploys the concept. Firstly, Žižek's approach retains the emphasis of clinical psychoanalysis on the individual patient. This is problematic when psychoanalytic categories have been transferred to the social field. The transformation involved in a Žižekian Act is subjective and personal, rather than relational, yet is assumed to have wide-reaching socio-ideological effects. This approach fails to situate ideological relations in social relations, and hence exaggerates the effect which a simple ideological gesture can have. This personalised approach also risks reproducing a therapeutic, self-adapting approach in which, 'under conditions we recognize as desperate, we are told to alter ourselves', not the conditions (Nielsen 1978: 168–70). It risks producing adaptation to social 'necessities' rather than their transformation. The difficulty is that, while a personal fundamental fantasy can be traversed by an individual patient, a homologous social ideology could presumably only be shattered at the social or intersubjective level.

Secondly, as a result of this personalised approach, Žižek does not attempt to formulate a politics of the excluded themselves. In his theory, the radical potential of the excluded derives from their structural position. Hence, it resides primarily in the excluded as they appear *for others*. This appearance is exploited for ideological disruption without being reconstructed as alternative social relations. Partly because he frames the question in terms of identification rather than a politics of the excluded, Žižek does not attempt to reconstruct the political forms which could arise from the excluded acting for themselves. As a result, he does not progress from the idea of the social symptom to an exploration of alternative forms of social life emerging at points of exclusion. This precludes engaging with the difficulties of analysis of concrete exclusion, hiding complexities beneath the apparent simplicity of structural logic. What if the actually existing excluded do not identify with their position, but construct their identities within the dominant fantasy-frame, or within an alternative neurotic frame which re-conceives their own position as that of the 'trunk'? What if a group is interpellated by the dominant fantasy-frame as a social symptom, but operates in its own fantasy-frame as the master-signifier? One cannot simply overlay the distinct levels of the structural-cultural position of a phenomenon, the distinct identities and meanings immanent to a social group, and the structures of individual psyches, each with different fantasmatic connections into or ruptures with the wider social field. Social fantasy

and social symptoms doubtless impact on the other levels, but are not identical to them.

In Žižek's theory, no distinction is made between different types of movements of the excluded – between ethnic conflict, 'terrorism', inner-city revolt, anti-capitalist protest and so on. This is not surprising given the choice of framing. In terms of their *significance for the gaze of the dominant system*, phenomena such as the Bosnia war, the *banlieue* revolts and the 9/11 attacks are indeed isomorphic. In terms of their *immanent construction* and *meaning for participants*, however, the events are heterogeneous. Furthermore, while Žižek generally identifies the social symptom with non-oppressive excluded groups such as immigrants, there is little *structural* reason why his theory should distinguish such groups from others, such as child abusers or suicide bombers, who are similarly subject to outrage and demonisation, but who are also engaged in harmful or oppressive actions. What is lacking, in short, is a clear account of how the radical potential of the excluded is, or can be, sometimes actualised and sometimes dissipated.

Instead of a politics of the excluded, what Žižek provides is a problematically representational emphasis on identification. This approach demands too little in terms of recomposition of social relations. Anyone can obtain the radical potential of the excluded subjectively, without relational transformations. Hence, for instance, a privileged academic such as Žižek can perform an authentic Act without at all altering their lifestyle or social inscription, simply by identifying with anathemas (Butler, Laclau and Žižek 2000: 122).

A third limit to this framing of the social symptom is a certain theoretical conservatism, particularly as regards the possibility of overcoming alienation and hierarchy (see Robinson 2005). Indeed, Žižek seems to treat the analogically neurotic structure of reality as inevitable. While Lacanian theory may allow for a passage beyond the field of neurotic desire through the concept of drive (Noys 2003), it is not apparent that any such passage occurs in the case of Žižek's Act. Rather, the social field is recomposed around a master-signifier. Žižek is very clear on the point that an Act leads to the re-emergence of an arborescent social order, but one in which certain blockages are overcome (Butler, Laclau and Žižek 2000: 92; Žižek 1999: 90–1, 331, 368; 1997b: 72–3; 1989: 211). Žižek constructs his idea that lack is a feature of desire *as such* in opposition to the idea that alienation results from *present, contingent* capitalist conditions (Žižek 1990: 56). In particular, the master-signifier is taken to be necessary (Žižek 1994: 43, 59, 1993: 49,

1992a: 103), and it is impossible to move beyond social exclusion or alienation (Butler, Laclau and Žižek 2000: 100–3).

Hence, the change involved in a process of identifying with the symptom is rather limited. The specific characteristics of social life do not necessarily change; what changes is how one relates to these characteristics (Žižek 1994: 57, 61). Identifying with the symptom may disrupt a particular system and its particular master-signifier, but it does not do away with the arborescent structure of the dominant society. One simply moves from neurotic incapacity to normal alienated subjectivity. The result – a change in perception which breaks blockages in the present order – falls well short of a recomposition of social relations. Ultimately, transformation remains subjective and 'ideological' (in the expanded Althusserian sense), and does not pass over into the overcoming of 'ideology'. For all its radical pretensions, Žižek's politics can be summed up in his attitude to neoliberalism: 'If it works, why not try a dose of it?' (Žižek and Salecl 1996: 32).

II. The Real and the Rhizome: Affirmative and Negative Symptoms

Deleuzian theory offers concepts which may lead out of the problems of Žižek's Lacanian analysis, in particular freeing the concept of the social symptom from the therapeutic confines of Lacanian theory and enabling more radical trajectories. Of the three problems outlined above, Deleuzian theory avoids the first problem of a focus on the subjective by situating subjective lines of flight in relation to transformation; the second problem of differentiating movements of the excluded through a theory of active and reactive desire; and the third problem of ontological conservatism by rejecting the conservative ontology of Lacanian psychoanalysis. It is in the third transition that the crucial break occurs which enables the others. In reconceiving the social symptom in Deleuzian terms, it is necessary to follow the transition from negative to affirmative philosophy and hence the emergence of autonomy as a vital political orientation.

In Deleuzian theory, the Lacanian Real is re-theorised as the rhizome, the positive force which is foreclosed in Lacanian theory. Where Lacan situates the Real, Deleuze situates the rhizome. Whereas the Real is a figure of negation, the point of breakdown for the dominant system, the rhizome is an affirmative figure, an alternative way of being. The Real does not disappear in this scenario, since it remains a feature of the dominant ideology. The Real is the rhizome as perceived by

the dominant gaze. The rhizome is identified as negative in neurotic character-structures because of the function of the master-signifier. Hence, the Real exists within specific neurotic character-structures, and as a result, master-signifiers produce social symptoms. This process does not have the transhistorical significance it is given in Lacanian theory, but the concept of the social symptom demonstrates the position of contingency and potentiality in a contingent, repressive social order. The existence of a social symptom is contingent on the existence of a repressive order. Hence, the symptom becomes the space not of lack as such, but of an excessive proliferation and potential abundance which creates a sense of lack or incompletion for the dominant gaze.

The affirmative approach of Deleuzian philosophy is constructed in distinction from the Lacanian approach, as articulated clearly in *Anti-Oedipus*. The basic claim of Lacanian theory is that identity – whether individual or social – is founded on lack. Therefore, social relations are always irreducibly concerned with antagonism, conflict, strife and exclusion. Hence, Žižek seeks an 'ethics grounded in reference to the traumatic Real which resists symbolization' (Žižek 1997a: 213). The Real is theorised as an amorphous, chaotic force, identified with anything incommensurable, and is viewed as arising in spaces of indeterminability. Žižek thus refers to 'the universal traumatic kernel which returns as the Same throughout all historical epochs', epochs which should be conceived 'as a series of ultimately failed attempts to deal with the same 'unhistorical', traumatic kernel' (Žižek 1992a: 81). People whose character-structure includes a master-signifier repress the Real in order to construct the symbolic field. For Deleuzians, this is a contingent effect of a particular personality-type; for Lacanians, however, this type of character-structure is inevitable. The ontological, rather than epistemological, status of the Real as an element of reality and not simply an incapacity to grasp a complex reality is strongly emphasised (Butler, Laclau and Žižek 2000: 216). The Real and the symptom are thus taken as points of a kind of primordial masochism, at which active desire is suspended out of a direct desire for displeasure.

As regards their critique of lack, Deleuze and Guattari are followers of Wilhelm Reich (see Deleuze and Guattari 1983: 29). Reich provides a critique of the Freudian death drive, a precursor of the Lacanian Real, which echoes closely the Deleuzian critique of Lacan and which, crucially, brings psychological effects back into the field of social power-relations. According to Reich, the masochistic tendencies Freud derives from the death drive are actually secondary forms of desire arising from anxiety. They are the result of 'the disastrous effect of *social* conditions

on the biopsychic apparatus' (Reich 1948: 209). In Reichean theory, the neurotic character-structure in which master-signifiers arise is a product of authoritarian parenting, the denial of unconditional love and the effects of an authoritarian social context. It is thus related to the social construction of scarcity as an existential condition. Recognition of the social basis of psychological repression reveals 'the necessity of criticizing the social conditions which created the neuroses – a necessity which the hypothesis of a biological will to suffer had circumvented' (209). In Reich's view, the apparently primordial force of masochism is actually a contingent effect of the psychological conflation of desired transgressive pleasures with anticipated dangers (221–2, 240–1). The thesis of primordial masochism is politically problematic because it provides a cover for the sadistic power-apparatuses which in Reichean theory produce actual effects of masochism.

On a related point, the Lacanian Real is associated with personified evil such as horror monsters and supreme evil beings (Žižek 1992b: 212–13; 1997a: 78–80, 199). This kind of fear is analysed in Reichean theory as an imaginary reaction to the separation of bodily energies and cognitive processes. Repressed energies become conceived as demonic influences and repression is viewed as protection against the devil (Reich 1948: 459, 461, 398, 427). This response of violence against desire personalised in the Other is exemplified in the kind of reactions discussed by Theweleit, which are equally crucial to Lacanian and Reichean/Deleuzian analyses of fascism. By situating the Real historically and socially, affirmative approaches allow the emergence of the social symptom to be connected to the construction of submerged, dominated personality-types rather than to 'the human condition' (cf. Freire 1970). Hence, processes of challenging submersion become crucial to emancipation.

The idea that many people are haunted by such a traumatic kernel is useful in conflict studies, and need not be rejected outright from a Deleuzian perspective. The crucial move for a Deleuzian is to resituate and particularise what is taken as universal in Lacan, and hence to open the possibility of moving beyond it. From a Deleuzian point of view, Lacan has not theorised the psyche *per se*, but has instead provided an insightful account of the dominant type of Northern, metropolitan, conformist personality. Other possibilities are either foreclosed or not theorised. For instance, there is little space in Lacanian theory for acephalous societies or social movements, for indigenous epistemology, or for liberationist understandings of psychological difference. Hence, the Lacanian view can be seen as an astute analysis of the neurotic

psyche which falls short of its radical potential by universalising this type of psyche. This reframing opens up other possibilities. The alternative to demanding a master-signifier – an illusion of order where there is none – is to reject the pursuit of the ordering function itself, and to embrace a rhizomatic politics which goes beyond this pursuit.

This Deleuzian move can be seen as a deepening of awareness of contingency. Lacanian theory embraces contingency up to a point, only to suspend this recognition by reifying contingency into a singular, structurally homologous element, the Real, and imbuing it with negativity, hence projecting epistemological uncertainty into ontology. This undermines the performative and reflexive implications of embracing contingency. As Butler claims, the Real 'is never subject to the same logic of contingency that it secures' (Butler 1993: 196). It is the unavoidable and irreducible nature of *negative* contingency which grounds the Lacanian argument for master-signification and hence for arborescent social forms. Butler remarks that Žižek's text is a 'project of mastery' and a discourse of the law in which 'the 'contingency' of language [is] mastered in and by a textual practice which speaks as the law' (198). As a result, Lacanian theory reproduces the tendency in academia to produce closed systems of knowledge which deny the possibility of radical difference. The 'contingency' embraced in Lacanian theory is not an openness which exceeds specifiable positivities, but a positivity posing as negativity.

Deleuze and Guattari are highly critical of the view of subjectivity as based on negativity. For Deleuze, the reason representation fails is epistemological: categories are always 'too general or too large for the real' (Deleuze 1994: 68). Like many radical ecological theorists, Deleuze and Guattari see scarcity as a contingent product of alienated society rather than an underlying existential condition. Guattari goes as far as to identify Lacanian negativity with capitalist authoritarianism: 'Without a boss, no factory; without lack, no desire' (see Guattari 1995: 151–62). He views psychoanalysis as unduly reductionist. 'Psychoanalysis transforms and deforms the unconscious by forcing it to pass through the grid of its system of inscription and representation. For psychoanalysis, the unconscious is always *already there*, genetically programmed, structured, and finalized on objectives of conformity to social norms' (Guattari 1996: 206). Similarly, Deleuze argues that the reduction of history to negativity produces a 'terrifying conservatism' (Deleuze 1994: 53).

Against the primacy of negativity, Deleuze and Guattari theorise the active production of difference as primary. Deleuze distinguishes the

primacy of negation in the 'politician's' perspective from the creative power of the poet. The latter feels the need to pass through antagonism to affirm, whereas the latter is initially affirmative. The latter expresses an underlying actuality. 'There is a false profundity in conflict, but underneath conflict, the play of differences', differences which should be affirmed as positive and not overcoded by negativity (Deleuze 1994: 50–4). It therefore follows that in a liberated person or society, active forces would have primacy over reactive forces, which would exist only as secondary expressions if at all, whereas in the 'neurosis' and 'paranoia' of the dominant forms of subjectivity today, the reactive forces gain a false and destructive primacy.

In attempting to reconstruct subjectivities against the primacy of lack in neurosis, Deleuze uses a distinction between active and reactive forces or desires. This distinction arises directly in Deleuze's *Nietzsche and Philosophy*, and indirectly under the names of 'schizophrenic' and 'paranoiac' desire in *Anti-Oedipus*. It also underpins other crucial conceptual binaries such as rhizomes and arborescence, being and becoming, and molecular and molar. The two forces express affirmative and reactive potentialities respectively. Active force pushes to its limits and transforms the world, whereas reactive desire turns against itself. Thus, 'only active force asserts itself, it affirms its difference and makes its difference an object of affirmation' (Deleuze 2006: 55–6). Active force is connected to the production of difference and the resistance of singularities to any totalising representations. It is ontologically primary over reactive force (41). In taking this stance, Deleuze and Guattari radically oppose the Lacanian model of desire. 'Desire does not lack anything; it does not lack its object. It is, rather, the subject which is lacking in desire, or desire that lacks a fixed subject... Desire and its object are a unity... Desire is a machine, the object of desire also a connected machine' (Deleuze and Guattari 1983: 26). Active force thus emerges as a line of flight from dominant subjectivities.

Reactive desire is not a unitary whole, and includes different ways in which active desire is compromised into social submission. Indeed, there are three types of reactive desire, the first being a contingent force of adaptation to the world, the second the disempowerment of desire (equivalent to Reichean repression), and the third, desire itself when distorted by repression (Deleuze 2006: 61). Reactive desire reaches its full form as desire is 'turned back against itself' in modern oedipal subjectivity (Deleuze and Guattari 1983: 217), operating through sexual, emotional and bodily repression (350–1). Reactive desire is connected to *ressentiment* and the creation of slave morality (Deleuze 2006: 60).

It turns back upon the world, inscribing its fears as a 'space of laws' (Perez 1990: 18–19). Affirmation is becoming-active, whereas negation is becoming-reactive (Deleuze 2006: 54). Active and reactive desire are associated respectively with the overthrow of power by sovereignty and the enslavement of desire by sovereignty (Deleuze and Guattari 1983: 366). Society constantly vacillates between the two poles (260). Reactive desire can dominate active desire only as anti-production, by alienating active powers from themselves (Deleuze 2006: 57). This provides the key to understanding how the social symptom can be the point of affirmative energies. The social symptom arises at the points where repressed active forces, or forces turned reactive by repression, become problematic for the force of repression. Transformative activity proceeds by strengthening active against reactive forces, and active forces appear in reactive dominant fantasies at the point of the social symptom. Hence, the social symptom is a primary site of the emergence of transformative possibilities.

III. Becoming-symptom? The Praxis of Minoritarianism and the Tasks of Schizoanalysis

Hence, from a Deleuzian standpoint, the social symptom exists, albeit scaled down to a contingent rather than essential structural entity. The social symptom is the point at which active forces are inscribed in the dominant fantasmatic frame. Hence, one can trace affirmative potentialities through dominant fantasies by means of their negative representations. They are represented as negative because they are excessive over the inscriptive and representational logic of the system, and thus *from its point of view* amount to 'lack', its own lack of total control.

So what might the social symptom become in Deleuzian theory? It is my contention that minoritarianism is the Deleuzian equivalent of the social symptom. In understanding the concept of minoritarianism, it is necessary to engage with the relationship between representation and singularity. For Deleuze, every entity is irreducibly singular, and different on some basic level from everything else. Each entity is irreducibly unique, in an almost Stirnerian sense. 'Beneath the general operation of laws... there always remains the play of singularities' (Deleuze 1994: 25). Difference is ultimately qualitative, not numerical (40). Representation is dangerous because of its necessary inadequacy to this complex, molecular, transversal field of flows and singularities. Hence, beneath limiting schemas and couples there are bundles of networks and

radiations in all directions (51); '[a]n entire multiplicity rumbles under the sameness of the Idea' (274). This rumbling multiplicity is somewhat akin to a repressed Real, and emerges in similar, symptomatic ways.

Minoritarianism is counterposed to the majority, and relates to it much as the Real relates to the master-signifier. In Deleuzian theory, the 'majority' is identified with the master-signifier. The difference between majority and minority is not quantitative but revolves around 'the determination of a state or standard' (Deleuze and Guattari 1987: 291). 'Majority implies a constant . . . serving as a standard measure' (105). Hence, a 'majority' is closely related to an unmarked term or globalised local in postcolonial theory, and to the concept of 'Benchmark Man'. Constructions of desire from very early in life are not merely familial but also involve marked and unmarked terms, superiority and inferiority (Deleuze and Guattari 1983: 278). Minorities are associated with marked terms, and also with movements towards the outside of the arborescent schema, hence with lines of flight, becoming-other and nondenumerability (e.g. Deleuze and Guattari 1987: 469). By becoming-nondenumerable, minorities threaten to shatter majorities. Actual minorities can fall short of this potential by being recuperated as minorities defined in relation to the majority, as a subsystem or axiom (105–6, 291). Hence, it is minoritarian forces (not necessarily all minorities) which haunt and disrupt the logic of the dominant gaze, forming the Deleuzian equivalent of the social symptom.

Symptomatic status is thus stronger in some groups than others, but also diffused across the social field. Concentrations of minoritarian energy are strongest in minorities, but such energies can emerge in anyone who rejects the dominant standard. In a sense, the majority is nobody, since it is an abstract standard, and the minority is everybody, 'one's potential becoming to the extent that one deviates from the model' (Deleuze and Guattari 1987: 105). A minoritarian force is necessarily inferior (marked), as differentiation from a majority is fundamentally 'marking'. Minoritarianism implies rejecting the process of marking, and hence the goal of becoming the majority or dominant group, instead pursuing advances at the molecular level (292). The power of minorities is the power to 'bring to bear the force of the nondenumerable sets, however small they may be, against the denumerable sets' (471). Powers of becoming of universal minoritarianism belong to a different realm from Power and Domination, and hence to a realm of autonomy (106). This gives minorities substantial disruptive force, as something akin to a Real haunting the dominant frame. What is unbearable for the

powerful about the struggles of minorities is not their content, which can often be conceded; it is the fact that people are formulating their own desires which do not flow from the system (470–1). In exceeding the system's inscriptions, minorities become socially symptomatic for the dominant gaze. This means that the idea of identifying with the social symptom is paradoxically prefigured in Deleuze. Identification with 'inferior' statuses is a part of the flows of schizoid or active desire, which claims to belong internally to 'inferior' groups or races (Deleuze and Guattari 1983: 86, 274, 277). Hence, becoming-other is also becoming-marked, becoming the social symptom.

Since active forces occupy a similar structural position to the Lacanian Real, it is unsurprising that similarities emerge at the level of therapy, in terms of the importance of introducing a relationship to the 'outside'. Deleuze and Guattari's approach to psychotherapy, termed 'schizoanalysis', has as its purpose the liberation of active energies and flows. It thus aims for deterritorialisation. This approach to therapy aims to untie the knots tied by authoritarian familial and social relations in the flows of desire (Deleuze and Guattari 1983: 316). This is similar to the Lacanian identification with the symptom, but differs in its identification of the outside or symptom with multiple potentialities which are unknowable in advance. The authors' critique of psychoanalysis is that it performs a territorialising function, mapping desire onto rigid schemas in ways which restrict it (e.g. Deleuze and Guattari 1983: 307–8, 312, 354). Their alternative is a 'scouring' or 'curettage' of the unconscious to remove repressive forces, blockages and character-armour (311, 314), 'causing the desiring-machines to start up again' (Deleuze and Guattari 1987: 339). This is not to uncover (make present) a repressed (representable) content, but rather, to uncover the possibility of flows beyond representation. 'Schizoanalysis... has no other meaning: Make a rhizome' (251).

Along with this negative task, there are two positive tasks of schizoanalysis: to discover the 'desiring-machines' in each subject, and to reinvest these machines in social production in revolutionary ways (Deleuze and Guattari 1983: 322, 341). The aim is a 'flick of the finger' which restarts movement, breaks out of the limited territories of fixed constructions and opens onto a new world 'created in the process of its tendency, its coming undone' (321–2). It introduces 'a bit of a relation to the outside' (334), similar to the Lacanian relation to the Real but recomposed in affirmative terms. Hence, the function of schizoanalysis is to free active desire from its containment in reactive forms. This is similar to the release of the symptom from its repression beneath the

master-signifier. It is also subtly different. Whereas the Lacanian process ends in the reconstruction of symbolic order, the Deleuzian process passes on into 'psychosis' or 'absolute deterritorialisation'.

The functions of philosophy and politics are conceived in similar terms to schizoanalytic therapy. The role of philosophy is to create new connections and new routes by creating concepts (Deleuze and Guattari 1996: 18, 23). Since no one plane of consistency can capture all of chaos, one must presuppose a multiplicity of planes, of philosophies (50). Deleuzian philosophy also calls forth a new earth and a new people (108). Deleuzian politics takes sides with minoritarian forces against master-signifiers and majorities. All desires infuse the social field, but divide into two types of 'delirium' or psychological complex, the 'fascisizing [*fascisant*]' type which disinvests every 'free' figure of desire and invests central sovereignty, and the 'schizorevolutionary type or pole that follows the lines of escape of desire; breaches the wall and causes flows to move; assembles its machines and its groups-in-fusion in the enclaves or at the periphery', producing an inverse effect (Deleuze and Guattari 1983: 277). It thus again emphasises active and reactive forces. It is by leaving the plan or plane of capital and the axiomatic, 'and never ceasing to leave it', that a group becomes revolutionary; it is in this 'deeper movement that challenges the worldwide axiomatic' that the proletariat and minorities can be revolutionary, passing into autonomism via themes such as the refusal of work (Deleuze and Guattari 1987: 472). Guattari posits a need to re-attain the plane of consistency through heterogeneity, and to 'activate isolated and repressed singularities that are turning around on themselves' (Guattari 2000: 51). The aim is thus re-singularisation, whether individual or collective (34). The political goal of Deleuzian theory is to actualise and activate the forces of active desire, constructing a space of absolute deterritorialisation in which networks overwhelm and destroy logics of hierarchy in their entirety (Deleuze and Guattari 1983: 511). As a technique, this involves finding the points where autonomous social movements emerge, where desires escape dominant social forms and where new connections and combinations come into being. This leads us into the field of rhizomes, subject-groups, nomads, becomings and so on – a recomposition of the field of the social symptom as a field of autonomy.

Identifying with the social symptom thus becomes a matter of rejecting majoritarian viewpoints and adopting a standpoint of autonomy. One can view the adoption of the *standpoint* of the excluded in terms of a reversal of perspective, as theorised by Situationists. 'To reverse

perspective is to stop seeing things through the eyes of the community, of ideology, of the family, of other people... [It is to] base everything on subjectivity and to follow one's subjective will to be everything' (Vaneigem 1967). From a reversed perspective, the disaster is not something borne by the excluded as a group haunting the dominant fantasy-frame; if anything, this is an emancipatory potential. Rather, the catastrophe is that things continue to 'go on as they are', that the disaster of a destructive social reality based on reactive desire has not been reversed (Benjamin 1985). Since this standpoint can in principle be adopted by anyone (as an outgrowth of the excess in their own desire over its inscription in capitalism), it is not necessarily related to the excluded as a positive social group, but to a certain extent articulates with the excluded point of the arborescent system. Given its affirmative nature, it is no longer 'excluded' so much as 'autonomous'. It is, however, a potentiality which is most densely concentrated at the point of exclusion, of the social symptom. Others obtain similar potentiality only by rendering themselves autonomous and hence 'symptomatic'.

IV. Viral Symptoms: The Social Symptom, the Network Form and the Excluded

So, what can an emphasis on the 'social symptom' contribute to radical politics? Using a Deleuzian approach, I would argue, firstly, that the crucial point is not 'identification' with the social symptom, a gesture which in the abstract may be subjective and substitutionist, however necessary it may be to break from dominant fantasies. Rather, it is the reconstruction of social life based on forces which exceed and escape the dominant frame, hence the ways in which the social symptom constructs lines of flight. Secondly, the point is not to identify with the *appearance* of the excluded, with what the excluded are for the dominant gaze, but rather, to reconstruct and theorise *the forms of autonomous potentiality which emerge at the points where dominant social order breaks down*. This potentiality arises as the affinity-network form. The network form is the form of social life excluded peoples adopt either *when they are not* trying to imagine themselves as included (that is, as autonomous social movements), or *in spite of* such fantasies. It is thus the formal correlate of the social symptom, the alternative which can be generalised as an alternative to the dominant hierarchical social order. One thus finds in the 'social symptom' not merely a point of intensity of the fantasy-frame, but an entire global alternative to the hierarchical logics of the state and capital, a different 'organising logic' with its own 'capabilities'. The

network form emerges both as the 'symptomatic' political form of the excluded, and as the means whereby people can recompose their social world as autonomous and hence 'become-other'.

To understand this derivation of the network form, it is important to reconstruct the situation surrounding exclusion today. On a global scale, the social symptom is associated with the swathe of people excluded from formal inscription in the world economy. The excluded emerge on a global scale at the points where large strata of humanity fall outside the world market. A growing number in the periphery are not only excluded from the role of full-time family-wage worker but may not get official employment at all, despite being bombarded with images of family and consumerist lifestyles (Gledhill 2000: 79). This produces a gap between social life and the dominant ideology on a monumental scale. Samir Amin has documented a massive rise of pauperisation and precarity now affecting around 80 per cent of the popular classes of the periphery (Amin 2004). Such poverty is a result of political choices made mainly by the privileged (Nederveen Pieterse 2004: 81–3), and constructs a stratum of people whose very existence is largely irrelevant to the dominant system except as bare life. William Robinson refers to the excluded as 'supernumeraries' – people so marginal that they are useless to capitalism and prone to revolt (Robinson 1996: 342, 378). Huge strata are simply ignored or excluded, rather than exploited (Dirlik 1994: 54–5). This also has political effects. Exclusion produces an effect of ongoing asymmetrical conflict as those with no stake in the dominant fantasy contest the territorialisation of space (Ward 1990: 89–90). Hence, as Caffentzis puts it, '[o]nce again, as at the dawn of capitalism, the physiognomy of the world proletariat is that of the pauper, the vagabond, the criminal, the panhandler, the refugee sweatshop worker, the mercenary, the rioter' (Caffentzis 1992: 321).

In addition, entire regions have become 'symptomatic'. Much of the global periphery is being forcibly 'delinked' from global capitalism due to cutbacks in global patronage. For instance, 'Sub-Saharan Africa has almost dropped out of the formal international economy' (Mann 2005: 55–6). As a result, 'whole regions have now become virtually independent, probably for the foreseeable future, of all central control' (Bayart, Ellis and Hibou 1999: 19–20). These spaces are the loci of the state's 'black holes', as networked social life takes over from the state, and informal organisations ranging from militias to alternative economies proliferate. Such networked forms are adopted as survival and accumulation strategies, as well as being reassertions of older forms of social life submerged beneath dominant forms. In addition,

autonomy can become a site of chosen otherness in which similar forms arise. Networked anti-capitalist movements and autonomous social movements in the North provide a further site of autonomy by means of rejection of the dominant system, operating on the basis of a viral 'swarm' logic counterposed to hierarchy (Chesters and Welsh 2006). Borrowing from Southern movements such as the Zapatistas, such movements construct spaces rendered 'symptomatic' through demonisation by the state and the media, intersecting with movements against precarity, against borders and for the reconstruction of social life through means such as social centres, squatting, autoreduction and food sovereignty.

The space beyond hierarchical assemblages, the space of the 'social symptom', is simultaneously the field of forced delinking and exclusion, and the field of the recomposition of networked forms of life. The excluded thus become bearers of the possibility of otherness, connected to affinity, active desire and the network form as an alternative to hierarchies. In sites of delinking (whether forced or voluntary), people turn to networked forms of social life to survive, and sometimes to construct political alternatives. While networks arise most intensely among those strata forced into material scarcity by capitalism, the logic of network life is towards the recomposition of abundance. Such phenomena of everyday networking have arisen across the global South. Hecht and Simone (1994) provide a series of examples from African societies of horizontal social forms such as 'popular neighbourhoods' which 'produce informal, and often illegal, associations, alliances, strategies and practice, that provide an infrastructure for the community and a measure of functional autonomy' (Hecht and Simone 1994: 14–15). Larissa Lomnitz (1977) studies survival and mutual aid networks in Latin American shanty-towns, revealing that kinship and neighbourhood relations form an entire informal economy enabling a layer of excluded people to survive on the periphery of major cities by means of horizontal relations. Similarly, Partha Chatterjee refers to entire population groups who transgress formal prohibitions to subsist, and articulate political claims around resources they claim directly (Chatterjee 2004: 40–1). One can thus view the network form as the performative response to the failure of inclusion.

It is this power of networks that imparts to 'symptomatic' social life the ability to act as a 'returning Real' that disrupts the dominant narrative. Returning to the case of the US/UN intervention in Somalia, identified above as an instance of an effectively disruptive Real, the 'social symptom' of the world order emerged from the frustration

of global power-designs by complex networked politics. From the perspective of the dominant gaze, the situation was one of breakdown and chaos, a site onto which a colonial frame of civilisation versus lawlessness was projected (Razack 2004). This assumption that state collapse, social collapse, civil war and predatory relations are a single phenomenon led to misconceptions of the situation. Would-be peacekeepers in Somalia imagined themselves to be restoring a state which in fact never existed as a stable entity (Menkhaus 2003: 412). The conditions of the existence of the Cold War-era state no longer pertained; this had been a patronage state based on extensive external aid flows (Menkhaus and Pendergast 1995: 2–3). On the other hand, social peace in earlier and later periods in Somalia had and has little to do with state strength, arising mainly from networked communal structures (Menkhaus 2003: 407, 412). This society of nomadic herders has a 'complex and powerful system of ethical norms and rules', including conflict-resolution mechanisms as well as the more visible patterns of feuding (Lyons and Samatar 1995: 7, 10). Centrifugal forces tending towards acephalous social formations are extremely strong in Somali society, are the main cause of state collapse, and should not be interpreted as disorder (Menkhaus and Pendergast 1995: 2). Hence, both predatory action and civil war were ultimately more amenable to networked local responses than to international violence. By clumsily violating local cultural understandings in a context where such violations lead to a culturally recognised right of revenge or feud, the UN set itself up for the disaster which befell it. Once embedded in the logic of feuding, the UN was defeated by locals using asymmetrical warfare tactics and local knowledge to outsmart the occupying force (Lewis 2008: 79). In effect, the UN was defeated by the diffuse, complex, wide-spectrum power of networks. The social symptom returned as the power of networks against the state.

While in Somalia the negative, disruptive power of networks was most apparent, in other settings this force is connected to affirmative potentialities providing concrete alternatives to the global neoliberal order. In Bolivia, a range of inter-networked social movements using tactics such as road blockades have transformed the nature of political power, repeatedly defeating neoliberal governments in struggles such as the Cochabamba 'water war' and the El Alto 'gas war'. They are a diverse and very broad movement with near-universal support (Crabtree 2005: 28, 31). Their basis is in networked everyday politics such as the close-knit community units of shanty-towns and the indigenous *aaylus*. Protesters using direct-action methods have blockaded roads

every few yards and turned back military and police forces (12, 28, 45–6). Crabtree refers to these actions as rooted in a direct, participatory way of 'doing politics' which is marginal to the formal state (109). It operates through oscillating intensities, resonances across localities and accidental alliances between diverse sectors (110–12). Through lines of flight originating in symptomatic positions of exclusion, new possibilities come into being.

A Deleuzian, network-based approach to the social symptom moves away from the personalised emphasis on identification towards an emphasis on lines of flight which perform disarticulations and rearticulations in everyday social relations. The reconstruction of social life can arise only from a thoroughgoing relational transformation beginning in everyday life. Furthermore, the problem of identifying with the excluded *is also a problem for the excluded*. While the excluded exist as a structural category, only some of their actions are driven by minoritarian forces and thus are truly 'symptomatic'. The excluded may not identify with their assigned status as excluded. At least two major variants of this problem exist. Firstly, there may be a drastic separation between a person's actual conditions of life, the means through which they subsist and act, on the one hand, and their identification with *aspirations* to 'normal' consumer, producer and family life on the other. In this kind of situation, the potential is great for 'network capitalism' and 'rhizome-states' to rearticulate networks as 'radicles' or root extensions of a central trunk.

Secondly, the excluded may redefine themselves as included through the elevation of their particular identity into a majoritarian status. This leads to the common phenomenon of *reactive networks*, organised in the symptomatic network form but with aspirant majoritarian fantasy-frames. While in-group relations take typical affinity-network forms, they are contained behind a fantasmatic boundary against demonised out-groups which reproduces dominant forces of exclusion and scarcity. This is the problem discussed by Deleuze and Guattari in relation to 'neoarchaisms' such as ethno-religious identities (Deleuze and Guattari 1987: 257–8). When a majoritarian fantasy-frame is combined with the network form, the effect is a reactive network. Yet such networks still exhibit some features of the liberating force of network power. This is shown in various studies of Salafi 'jihadi' or 'terrorist' networks, the social symptom *par excellence* of the 'War on Terror' – for instance, in Marc Sageman's study of Salafi networks, which emphasises the importance of intra-network integrative forces connected to affinity in constructing the cohesion of these strongly reactive networks (Sageman

2004: 107, 138). Similarly, Wiktorowicz shows the network to be subject to strong centrifugal pressures (Wiktorowicz 2005: 209). It operates through 'micromobilisation' in local network nodes and through a fluid system of leadership by reputation (210, 214).

Hence, even in its reactive form in which majoritarian fantasies drain its emancipatory potential, the network form shows many of the structural characteristics of the affinity-network. It is in this way that the 'social symptom' can carry the fundamental tensions of the dominant system even when the main attention is on its reactive features. Such movements are not symptomatic because of their excessive violence (a feature they share with states); they are symptomatic because they involve expressions of the network form, *in spite of* their exclusionary reactive attachments. Hence, the difficulty with these movements is paradoxically not that they are 'too extreme' but that they *have not gone far enough* in rejecting the exclusionary logic of the dominant system. Reactive and radicle networks do not identify with their own status as social symptoms, and thus do not gain thoroughgoing emancipatory force. When networks identify with the network-form as immanent aspiration as well as actual praxis, the result is a type of social movement which can be termed 'autonomous'.

In line with the Deleuzian theory of minoritarian lines of flight, there is a need to politicise exclusion through converting it into the auto-affirmative logic of autonomy. Autonomy refers to exclusion or self-exclusion when it is positively valued rather than rejected. The revolution-to-come is not a new order but a breaking-down of all asymmetrical and hierarchical social orders, in favour of a horizontality without borders. In distinction from but built upon Mike Davis's 'planet of slums' (Davis 2006) – a world where the majority are radically excluded – the coming world is a 'world of squats' (with the social centre as paradigm), a world of informal diffuse networks distributed transversally, in which the excluded space becomes a space of abundance through everyday social recomposition and the reclamation of ecologies from capitalist resource-extraction. The question determining the viability of this transition is how networks of the excluded can learn to valorise what they are, rather than mapping arborescent 'norms' onto their movements or scrambling to find a place on the inside.

This is quite different from Žižek's approach, in which autonomy is rejected as an ideological appearance (Butler, Laclau and Žižek 2000: 134). It shows the difference between an affirmative and a negative approach to political transformation. While the analysis

of the importance of the social symptom is similar, the political conclusions are extremely different – the difference between Žižek's neo-Leninist hierarchical politics and a horizontal orientation directed at the proliferation of autonomous networks against the global system.

V. Conclusion: From Social Symptom to Symptomless Society?

Hence, a Deleuzian approach offers a thoroughly transformative, emancipatory alternative to hierarchical politics. In this context, a political orientation to the social symptom becomes something more than a temporary gesture of individual 'grace' or fantasmatic reorientation. It opens the possibility for moving beyond an alienated society based on hierarchies, master-signifiers and quilted Althusserian ideologies, into a world where the whole of social life is composed of open rhizomes constructed around active forces and desires, a world of absolute deterritorialisation (Deleuze and Guattari 1987: 511). Such a world becomes possible through the proliferation of lines of flight arising from the tendential outside constructed in autonomous spaces and autonomous social movements. From the standpoint of the dominant gaze, this tendential outside is 'symptomatic', and the cutting edge of diverse lines of flight can often be located in the points where, for the dominant ideology, a 'social symptom' expresses the return of contingency and the loss of sovereignty as incommensurable forces break free of systemic control.

A Deleuzian orientation thus goes far beyond *identification* with the symptom, as a symbolic and imaginary gesture; it enters into solidarity through the immanent relationality of the symptom at the level of the 'Real', reconstructing social life in terms of the networks which typify the symptomatic space. Becoming-symptom, or becoming-minoritarian, requires that one reconstruct social life beyond the territorial inscriptions (social, ecological, psychological) which constitute both the politico-strategic dominance and the ideological cohesion of the dominant system, and of hierarchical systems in general. It thus offers a substantial, intersubjective, 'material' and social challenge to the dominant discourse, not simply a symbolic challenge or a reconfiguration of elements.

In Deleuzian theory, the absolute deterritorialisation borne as potentiality by the social symptom carries the possibility of shattering the entire ideological and relational frame of hierarchical systems, rendering the social symptom the point, not only of the breakdown of the internal fantasy-frame of the dominant system, but also of its

relational and functional breakdown and of possible passages beyond it. As a result, it bears the potential to shatter the function of the master-signifier and hence not only recompose but decompose the matrix which produces social symptoms. In a sense, the result is a 'symptomless society', a society in which, in the absence of sovereignty, there is no ideological production of social symptoms. But it might also be viewed as a society composed only of symptoms, a society in which everyone is 'minoritarian' and 'marked', and, therefore, nobody occupies the position of mastery. This transformation cannot be achieved from inside the dominant fantasmatic frame, because the reproduction of this frame requires the reproduction of the master-signifier as a structural form. Nor is it inevitable in the case of networks of the excluded. It is, however, in the latter that its potentiality resides. The recomposition of social life from the position of the social symptom arises as a line of flight through the construction of affinity-networks as a comprehensive alternative to hierarchical social forms.

Making Restorative Sense with Deleuzian Morality, Art Brut and the Schizophrenic

Lorna Collins Jesus College, Cambridge

Abstract

The essay consists of three parts: the first argues that Deleuze's moral philosophy in *The Logic of Sense* provides an ethical model of counter-actualisation; the second shows how three different practices of art therapy offer a means to effect this counter-actualisation and thereby demonstrate the restorative power of art; the third explores how such a power might form part of what Guattari calls the 'ethico-aesthetic paradigm' (Guattari 1995).

Keywords: morality, counter-actualisation, art practice, therapy, restorative sense

In *The Logic of Sense*, Deleuze presents case studies showing particular examples of moral problems – such as Bousquet's wound, Artaud's madness, or Lowry's alcoholism – in order to describe series of singularities that provide turning points which define the real. Deleuze argues that by replaying such singularities with creativity and expression one can constitute new events and source potential relief from the causes of these moral problems. Deleuzian morality involves an aesthetic consideration and an artistic practice capable of offering rehabilitation and restorative sense for those who have psychiatric disorders, or for any of us when we have wounds or experience pain. Replaying events that exemplify moral problems or wounds, with creativity and expression, offers the chance for counter-actualisation, sublimation, catharsis and ontogenesis.

Deleuze Studies 4.2 (2010): 234–255

The question then comes down to *how* one can replay events in this way. The examples to be discussed below – Theatre of the Oppressed, an application of art therapy, and the genre of Art Brut – suggest a number of possibilities. In these cases art provides individuals with a method of making sense of the world and of their condition, whilst offering some form of relief. In terms of Deleuzian morality the tortured individual is encouraged to replay the event of their wounding in a way that provides catharsis and the counter-actualising of pain. Just as Deleuze turns to literary figures like Bousquet, Artaud or Fitzgerald, the artistic practices explored here open up the possibility of a freedom both patent and potent during the creative process, in a sense consistent with Guattari's 'ethico-aesthetic paradigm'.

I. Deleuze's Moral Philosophy

In *The Logic of Sense*, Deleuze utilises the schizophrenic and the pervert to create a rupturous new thought, outlining in the process the practical principles of a moral philosophy. This is particularly interesting because it involves the counter-actualisation of the wound and the sublimation of pain, implicating a different understanding of time and the event, and drawing up an ethical model. Deleuze engages with schizophrenic discourse in order to highlight the way that the schizophrenic's language foregrounds a dual or paradoxical sense of sense and nonsense, at the edges or on the surface of sense-making. Deleuze uses the words of Artaud, such as 'Ratara ratara ratara Atara tatara rana Otara otara katara…', and the nonsensical words of Lewis Carroll, like 'Pimpanicaille', because he is trying to free up set meanings for words, opening up their signification to a multitude of interpretations (Deleuze 2004: 96). In the schizophrenic's language, words become 'suitcases' for a multitude of paradoxical meanings, each one determined on or during the event of their utterance. Deleuze then uses the multiple layers of reality that define the schizophrenic's psychosis to open similarly heterogeneous and spontaneous possibilities for making sense. This sense is embodied, and located at the edge or on the surface of things and propositions. In this case his use of the schizophrenic offers a multiplicity that redefines the subject as a continually changing process of individuation, undoing its identity and reorientating thought.

There remains a violent and chaotic perversity to this kind of philosophy. The intention is to form an understanding of subjectivation – or a relation to oneself – that is not tied to a transcendental subjectivity, but is a qualitative multiplicity or relational

entity which is continually becoming-other. The process of defining this transgressive and unstable sense of the subject often seems destructive or dis-eased, advocating a body without organs, the body of a drug addict, or one suffering from another psychiatric disorder, so that it is hard to see how any stable sense or human could remain healthy or alive.

Deleuze does, however, state elsewhere that the intent is to retain *some* sense of the subject and lay out a transcendental plane of consistency for thought, rather than to destroy or deconstruct being entirely. In *A Thousand Plateaus*, when describing the body without organs (BwO), Deleuze and Guattari advise caution in undertaking the explicit destruction that they argue is necessary. One must retain a *small* sense of subjectivity:

> Dismantling the organism has never meant killing yourself, but rather opening the body to connections that presuppose an entire assemblage . . . You have to keep enough of the organism for it to reform each dawn; and you have to keep small supplies of signifiance and subjectification . . . and you have to keep small rations of subjectivity in sufficient quantity to enable you to respond to the dominant reality. (Deleuze and Guattari 2004a: 178–9)

This raises the question of just how much subjectivity is enough to hold together the particular individual that we are, but not too much to curtail the continuous flux of our identity. As the authors themselves say, there is a danger of overdosing destruction. Shaping the subject requires the artistic work of 'a very fine file', rather than a blow from a sledgehammer, in order to establish what degree of destruction or experimentation is sufficient to liberate the subject, and what is excessive and dangerous (Deleuze and Guattari 2004a: 177).

Deleuze is continually trying to undo the static and dichotomous sense of a subject seen in formations of subjectivity from the Cogito onwards. There is a continual battle running through Deleuze's thought as he trys to destroy any kind of static or set sense of self, whilst retaining enough of a self to constitute a living organism capable of carrying out this destruction. As he says, one must take care with these experiments and explorations with psychiatric disorders and substances: 'The important thing is not to dismantle the tonal by destroying it all of a sudden. You have to diminish it, shrink it, clean it, and that only at certain moments. You have to keep it in order to survive. . . ' (Deleuze and Guattari 2004a: 180).

But Deleuze offers the reader no guide for judging how to take heed of these warnings. Deleuze and Guattari then seem

overtaken by the ongoing dynamic of 'Destroy, destroy' that dominates *Anti-Oedipus*, which provides the recurring flavour of dis-ease and rupture that defines Deleuze and Guattari's thought (Deleuze and Guattari 2004b: 342). In both volumes of *Capitalism and Schizophrenia*, Deleuze and Guattari question the violence and pathology involved in their own thinking. They advise that we should all take 'caution' when following the schizoanalytic direction or adopting the mental processing of the drug addict, anorexic, or masochist, etc., but their methodology of utilising these cases as figures of thought does not define the kind of prudence required (Deleuze and Guattari 2004a: 177). They do say that it would be *better* if one could achieve the thought process of the drug addict or the alcoholic *without* relying on drugs or drink, but their argument affirms a state of mind which depends upon these pathological behaviours. They assert the need for caution, but offer no way of judging how to be cautious, whilst their argument still depends upon an appeal to the pathological individual.

It is easy to question whether one must suffer from a debilitating illness, entertain potentially destructive behaviours, or take illegal substances, in order to create a new way of thinking. Deleuze and Guattari state that their philosophy involves becoming a *little* bit schizo. But it is difficult to ascertain what dosage would be sufficient or appropriate to attain the liberation and restorative sense offered by their thinking, particularly when they offer no advice on how one might raise or control the dosage.

In *The Logic of Sense*, however, Deleuze presents a different perspective – one which, as James Williams argues, does offer some practical principles for a moral philosophy (Williams 2008). Deleuze describes why he employs the amoral in his philosophy by showing how his repeated turn to the motifs of sadism, perversion and 'maladies' like schizophrenia can be traced back to the Stoics' use of similar amoral motifs such as incest or cannibalism. Seeing how the Stoics used amoral motifs helps us to understand why Deleuze's philosophy takes the direction that it does.

In the eighteenth series of *The Logic of Sense*, Deleuze argues that entertaining maladies, or engaging with mania, depression or psychological problems, is a properly philosophical exercise. He says that one shouldn't equate philosophy with an illness, but 'there are properly philosophical diseases' (Deleuze 2004: 145). He then describes how mania 'guided' Plato, and says that the death of Socrates was something like a depressive suicide. Deleuze goes on to discuss how the Stoics invoked – or made permissible – activities such as masturbation,

cannibalism and incest in order to pose difficult and new philosophical questions:

> On the one hand, the philosopher eats with great gluttony, he stuffs himself; he masturbates in public . . . he does not condemn incest with the mother, the sister, or the daughter; he tolerates cannibalism and anthropophagy – but, in fact, he is also supremely sober and chaste. On the other hand, he keeps quiet when people ask him questions . . . Yet he also holds a new discourse, a new logos animated with paradox and philosophical values and significations which are new. (Deleuze 2004: 147–8)

These words seem to represent Deleuze's efforts to legitimise the controversy raised by his own philosophy's exploration of psychological problems. This is the way that Deleuze defines what philosophy actually is – as he says at the end of the eighteenth series: 'What are we to call this new philosophical operation . . . ? Perhaps we can call it 'perversion" (Deleuze 2004: 151). It seems a radical, contentious proposition to equate philosophy with perversion, but the reason Deleuze makes this claim, and makes use of the Stoics, is, he says, because it brings *the body* into play with thinking. Involving the body in this way then connects with the desiring-machines and BwO at play in schizoanalysis. Deleuze says that the Stoic philosophy, by engaging with amoral motifs, enables an opening up of 'passions-bodies and of the infernal mixtures which they organize or submit to: burning poisons and paedophagous banquets' (149). The point of this is to reorientate thinking: Deleuze wants to define philosophy by perversion as part of his overriding effort to construct a new kind of philosophy, one which uproots Platonic Idealism, dialectical contradiction, hierarchy, striation, causality, transcendence, signification and metaphysics: 'This is a reorientation of all thought and of what it means to think: *there is no longer depth or height*. The Cynical and Stoic sneers against Plato are many. It is always a matter of unseating the Ideas, of showing that the incorporeal is not Essence but event' (148).

In Deleuze the amoral motifs of incest or cannibalism engage with 'passions-bodies', reorientating thought away from Platonic Idealism or dialectical contradiction by engaging with the flesh and forces of the body. This opens up a plane of immanence for the BwO. From the start, Deleuze says, the pre-Socratics make schizophrenia 'properly philosophical' because with it they situate and activate thought in the body (Deleuze 2004: 148, translation modified). This raises the question of dosage: can we think with the body without (potentially) damaging it? Does thinking with the body, and founding a new philosophy, *require*

the likes of perversion or incest? Does it legitimise these activities, and if it so, how is freedom ever possible? After all, one cannot choose to be schizophrenic. Does Deleuze mean that it is a positive mentality and so we should desire to suffer from it?

Deleuze does anticipate such doubts on the part of the reader. He questions the Stoics' use of amoral motifs, which raises the same questions for his own philosophy: 'How could the world of mixtures not be that of a black depth wherein everything is permitted?' (Deleuze 2004: 148). The Stoics paint a picture of 'a world of terror and cruelty, of incest and anthropophagy', Deleuze says, and the reason why this works is because it opens a new mode of thinking *at the surface of things* (150). There is another paradoxical part to these activities, beyond their perversity, which comes from a different and non-causal understanding of time. The surface lays out a theatre for a paradoxical intertwining of sense, which provides an interface for expressions and their representation – propositions, bodies and events in their immanent arousal.[1] Here there is no hierarchy or depth or cause; just a flat surface for the body and its reorientating of thought:

> there is of course another story, namely, the story of that which, from the Heraclitean world, is able to climb to the surface and receive an entirely new status. This is the event in its difference in nature from causes-bodies, the Aion in its difference in nature from the devouring Chronos. . . . The Cynics and the Stoics establish themselves and wrap themselves up with the surface, the curtain, the carpet, and the mantle. The double sense on the surface, the continuity of the reverse and right sides, replace height and depth. (Deleuze 2004: 150)

Deleuze gives us particular examples of moral problems – Nietzsche and Artaud's madness, Fitzgerald and Lowry's alcoholism, or Bousquet's wound – because he wants to create a moral philosophy based on charting a series of singularities as events which, when considered as particular examples across a broad scan of society, demonstrate turning points that define the real. He argues that one must consider and replay the events of suffering in order to source a process of counter-actualising for what is amoral or damaging, whilst retaining the engagement with the process of the event and the emphasis on the body. This develops a diagrammatic of intense relations and particular phenomena within society, which then charts how they set a pattern to constitute and divine new events.

Deleuze argues that there will always be moral problems. His moral philosophy is then about charting series of actual turning points when

things are changing – the social, political, individual and singular turning points – and connecting diagrams of intense relations and particular phenomena within society. From this process it is possible to draw a chart that shows how moral problems constitute and divine *new* events, connected through the event that runs through all of them.

The point is to *actualise* the disruptive, corporeal *dynamic* that can be accessed through perverse or damaging behaviours, whilst simultaneously *counter-actualising* their perverse or damaging *event*. This involves a different non-causal conception of time. Deleuze presents a dialectic opening of series of time with Chronos and Aion in *The Logic of Sense*. On the one hand time is Chronos, where the present has some kind of extension that is sensual and corporeal. This involves a plurality of presences, which have no cause-effect relation but exist as wounds of time. The future and the past make marks on the present since they exist as relations to the present, but there is only one dimension. This dimension is material: 'Inside Chronos, the present is in some manner corporeal. It is the time of mixtures or blendings, the very process of corporeality' (Deleuze 2004: 186; translation modified). The future and the past exist as relations to the present, and take the form of 'what is left of passion in a body' (186). The future and the past affect our attitude towards the present, and our bodily presence in the present, and so they shape the present and our place within it, as a univocal being of difference.

On the other hand, Deleuze brings us another reading of time with Aion, where only the past and future are real and there is no present: 'In accordance with Aion, only the past and the future inhere or subsist in time. Instead of a present which absorbs the past and the future, a future and past divide the present at every instant and subdivide it ad infinitum into past and future, in both directions at once' (Deleuze 2004: 188). Aion is 'the eternal truth of time: *pure empty form of time*' (189). This is because through the dimension of being the future of the past, Aion opens up the sense and becoming of the eternal return of difference, in which the process of counter-actualisation is realised. It is the time of the event, which is 'always and at the same time something which has just happened and something about to happen; never something which is happening' (73).

The process of counter-actualisation is the eternal return in a cyclical repetition of the future of the past. The event is actualised in its present happening, from a proliferation of virtual possibilities. It marks an eternal wound on the present since it has an effect on one; then, in *willing* and *expressing* its presence in the present, as one of difference,

one can access a sublimation which can counter-actualise its wounding. The motor of this function is the repeating cycle of ontogenesis, in the becoming of the future of the past, which composes the sense of the present. In this context our wounds are the marks that make us real, and which demonstrate our contact with the world. As Jack Reynolds comments, in Deleuzian ethics we are all wounded: 'we are all traversed by some kind of fault-line (a virtual, impersonal intensity) that is supra-individual and not confined to the realms of bodies and states of affairs.... [I]t is the concept of counter-actualisation that he uses to more fully describe what is involved in the appropriate manner of giving body to an incorporeal event-effect' (Reynolds 2007: 154).

In this context sense is the fourth dimension of a proposition, which is an expression of being-in-the-present. The other three dimensions are the denotation, manifestation and signification of a proposition. Sense and the event 'are the same thing' (Deleuze 2004: 191). The event has an intrinsic relation to sense through the process of counter-actualisation. As Buchanan says: 'The event is the sense *we make* of what happens.... To the extent we take charge of events we counter-actualise what occurs, we see beyond actions and live the purity of the event, the crystal of sense awaiting us in all phenomena' (Buchanan 2000: 79). As such, the event is something we have to *will*, rather than something to which we succumb, not as a figure of *ressentiment* to its eternal or damning trauma, but in expression comes counter-actualisation and the opening for difference: 'The event is mot what occurs (an accident), it is rather inside what occurs, the purely expressed' (Deleuze 2004: 170).

Deleuze uses the French novelist Joë Bousquet to describe how the moral actor acts by diminishing Chronos, or the wound, and using it to become something different. Bousquet uses his wound to inspire his surrealist writing. There is a moment of elevation or sublimation, whereby the wound becomes something different. The tortured individual sublimates their wound and pain, releasing its counter-actualisation, through replaying the event with creativity and expression: 'He apprehends the wound that he bears deep within his body in its eternal truth as pure event' (Deleuze 2004: 169). Creation counter-actualises the pain by re-enacting the wound and putting it in touch with values that run to counteract its suffering and injuries.

Deleuze argues that a stoic moral philosophy, which he upholds in *The Logic of Sense*, is about creative lives, and 'a concrete or poetic way of life' (Deleuze 2004: 169). The idea is that one can deal with moral problems by replaying the event of their occurrence with creativity, which can counter-actualise their destructive or painful connotations.

James Williams explains how the act of counter-actualisation of the wound by replaying the event defines Deleuzian morality:

> The moral problem is . . . how to redouble the events occurring to us. These events are signs of the future and the past, but they have no necessary path. Deleuze's moral principles never recommend a particular course of action or align to necessary rules or models. On the contrary, they put forward guidelines and examples for picking our own way through the events that happen to us. His gift is of moral freedom in a complex structure and not compulsion or imperatives. (Williams 2008: 162)

Williams argues that Deleuze brings forward six moral principles in the twentieth series of *The Logic of Sense*, 'On the Moral Problem in Stoic Philosophy' (Deleuze 2004: 162–7). The first comes with the example of the stick and the egg, and the moral problem of how to break the egg. Deleuze is a realist – one cannot prevent the egg from getting broken – and says that the moral problem involves the *singular* situation of considering this particular egg and this particular stick, with the mixture of propositions, bodies and sense; immanent physical effects and established ideas and meanings. The second moral principle is that the event of the breaking has to be *willed*. Thirdly, the individual to whom the moral problem relates must deduce the arrival of the event with a process of *divination*. This concerns looking at the series of turning points and the expression of ideas in order to divine how new events might be constituted. The fourth principle involves charting the specific examples of the moral problem to be drawn together and their connections highlighted in order to respond to them *creatively*. The fifth principle describes the necessity of *representation* in divination and the willing of the present event. A moral problem requires a representation of its singular event and individual expression. Lastly, the event of the moral problem must be expressed in terms of its eternal significance, and also represented in its present happening. This involves two different processes of thinking about time, Aion and Chronos.

Williams derives thirty-two further principles from Deleuze in the twenty-first series. He says that Deleuze's use of examples like Bousquet or Fitzgerald presents case studies that illustrate his principles, providing a practical guide for how to act morally. On the one hand Deleuze's engagement with art, and the necessity for creativity in dealing with pain and moral problems is very important. But before we reach that point further moral questions must be raised. Does one have to suffer, and then replay suffering, in order to be free? Is freedom based on an

originary wound? How can the tortured individual know how to replay the events of their wound to find restorative sense?

Deleuze himself asks similar questions to these in the later chapters of *The Logic of Sense*. He talks about alcoholics, citing Fitzgerald's *The Crack Up*, which he uses to think about those who might suffer by reacting to the world in ways which Deleuze then wants to use to define his new philosophy. He considers whether or how it is possible to use the 'Crack Up' as a figure of thought that engages with the body, but without actually cracking up:

> Is it possible to maintain the inherence of the incorporeal crack while taking care not to bring it into existence, and not to incarnate it in the depth of the body? More precisely, is it possible to limit ourselves to the counter-actualization of an event – to the actor's or dancer's simple, flat representation – while taking care to prevent the full actualization which characterizes the victim or the true patient? (Deleuze 2004: 178–9)

It is hard to know whether any of the questions that Deleuze asks here can be answered by following his moral philosophy. But they touch upon the same questions that direct Deleuze's work with Guattari and schizoanalysis. Schizoanalysis is concerned with founding a new way of thinking about desire, which engages with the body and can create a 'place of healing' and restorative sense not only for the schizophrenic but for all of us. Here Deleuze is asking how one can think with the body, replay the event and counter-actualise the process of cracking up. He goes on to discuss, with insight and sympathy, the alcoholic's pattern of behaviour and the reasons behind his dependence on drinking as a 'process of demolition'. He ends the chapter with compassion, expressing the hope that the effects of drugs or alcohol might be revived and recovered independently from the use or abuse of these substances:

> We cannot give up the hope that the effects of drugs and alcohol (their 'revelations') will be able to be relived and recovered for their own sake at the surface of the world, independently of the use of those substances, provided that the techniques of social alienation which determine this use are reversed into revolutionary means of exploration. (Deleuze 2004: 182–3)

We can think about how Deleuze might try to respond to these questions by looking at the creativity and expression required to replay the event and counter-actualise suffering, particularly on the part of the schizophrenic. Deleuze offers examples from the arts, and his moral philosophy implicates an aesthetic; in the following section this will be taken a step further, showing how Deleuze's moral philosophy calls for

the therapeutic application of an art practice, which reveals something intrinsic to art and creativity *per se*.

II. How to Counter-actualise the Event: Art Therapy and the Schizophrenic

The process of counter-actualisation is, as Ian Buchanan suggests, central to Deleuze's constructivist philosophical enterprise: 'Counter-actualisation, Deleuze argues, is what the free can do, or more precisely what the free do; by free he means free of resentment and envy (the free do not try to profit from their wounds, they want only to own them)' (Buchanan 2000: 87).

Deleuze encourages us to be actors and to replay events. Reynolds describes the ethics in *The Logic of Sense* as 'an ethics of the mime and of acting' (Reynolds 2007: 154). Exemplary here is Augusto Boal's *Theatre of the Oppressed*, a theatrical practice which was founded and developed in reaction to the catastrophic dictatorship that crushed Brazil during the 1960s (cf. Boal 1979). Premised on the understanding that 'to act' means both to perform and to take action, in Boal's form of theatre we are all actors – the actor/audience split that demarcates traditional performance is realigned. Spectators become 'spect-actors' and have the chance to react, replay, improvise and invent possibilities for new action in a performance. This is 'Forum Theatre', which presents a rhizomatic plane of composition for a *representation* of the oppressed subject, an *expression* of their subjugation, and a *production* for reform. It is a theatre 'of the Oppressed' because the enterprise is motivated by the need to act upon, and the desire to change, situations where people are disempowered, marginalized, silenced or subordinated.

The drama brought to the Forum Theatre presents scripted instances and examples of these situations, which the spect-actors then replay, experiment with and invent new possibilities with a view to changing the situation of oppression. Working in prisons and with homeless people in particular, Boal found that his simple system of simultaneous dramaturgy empowered people and promoted a creative, democratic dialogue that could provide an instrument of social change. Participants act out the scene of a particular situation that is problematic in their lives. They interact with the scene, change what happens, and think about what the ideal action might be. The point is to keep replaying and changing the situation until a way to resolve the matter is found. This generates dynamic new ways of dealing with oppression, and of preventing it. It prompts suggestions that can be taken to the

protagonists responsible for the oppression in the first place, to apply pressure for the necessity of legal change. Forum Theatre becomes 'Legislative Theatre'; theatre transforms reality.

Theatre of the Oppressed offers one way of replaying events that present the moral problems arising in situations where people are oppressed. As such it generates a sense of freedom for its participants. We can expand on this topic to consider how art is able to help us deal with moral problems, such as those presented by the clinical cases that Deleuze uses to define his understanding of being: the alcoholic, drug addict, anorexic or pervert, and in particular the schizophrenic. We can see how *art therapy* can help us to counter-actualise the wounding of the event. To do this it will be necessary first to define art therapy, second to describe – with the help of a case study – how it can help the schizophrenic, and finally to take this back to Deleuze to show how it can provide us with a 'place of healing' more generally.

The British Association of Art Therapists defines art therapy in the following terms:

> The use of art materials for self-expression and reflection in the presence of a trained art therapist. Clients who are referred to art therapy need not have previous experience or skill in art, the art therapist is not primarily concerned with making an aesthetic or diagnostic assessment of the client's image. The overall aim of its practitioners is to enable a client to effect change and growth on a personal level through the use of art materials in a safe and facilitating environment.[2]

Art therapy is an activity based on the assumption that visual symbols and images are the most accessible and natural form of communication within the human experience. Patients/clients/participants are encouraged to visualise, and express, the thoughts and emotions that they find difficult to talk about. The resulting artwork is then reviewed and interpreted by the patient and therapist. Making sense of the artwork produced in art therapy, during this review, typically allows patients to gain some level of insight into their feelings and lets them work through these issues in a therapeutic manner. The creative process involved in artistic self-expression helps people to resolve conflicts and problems, develop interpersonal skills, manage behaviour, reduce stress, increase self-esteem and self-awareness, and achieve insight. The positive, restorative results of art therapy are obtained through the phenomenological process of interacting with art materials and using them to create some kind of form that responds to what is on the patient's mind, and also from the conversation and process of

sense-making that the artwork they create prompts between them and those who see their work.

It is a commonly held opinion that art therapy can have beneficial effects in the assessment and treatment of a variety of illnesses and conditions, and in particular of psychiatric disorders and situations which involve anxiety, depression and mental or emotional problems. Recent research has demonstrated that art therapy is effective for those who suffer from psychotic illnesses such as schizophrenia. The National Institute of Clinical and Health Excellence (NICE) issued recommendations on the application of art therapy on the NHS for people with schizophrenia in 2008, which was publicised by the BBC.[3] Dr Tim Kendall, co-director of the National Collaborating Centre for Mental Health, helped to gain data from six different trials on several hundred people, finding from their results that dance, art and music therapy have 'a positive benefit' for schizophrenia. Dr Mike Crawford, also involved in this survey, said that art therapy helps the psychotic because their illness leads to problems with communication: 'With psychoses, part of the problem is hallucinations and delusions and it becomes really hard to talk to people about them – and people become isolated because no one is listening to them.'[4]

A study by Brooker et al., *The Use of Art Work in Art Psychotherapy with People Who are Prone to Psychotic States: An Evidence-Based Clinical Practice Guideline*, presents a detailed survey of the ways that art therapy can help the schizophrenic (Brooker et al. 2007). This research emphasises the way that art-making offers a language through which the client can communicate their emotions and feelings, and express what they cannot say in words. Art gives them a way to give form to the unspeakable complexities that constitute their life, and provides them with a method for making sense of themselves and the world:

> research has shown that Art Psychotherapy offers a stepping-stone from isolation to the outer world for people who have experienced, and are experiencing, psychosis. Making art in Art Psychotherapy provides a form of engagement that enables the maker – the client – to become absorbed, this being one of the tasks of therapy. The Art Psychotherapist fosters the evolution of the client's language through their artwork; this enables a mediation to occur between the client's concrete and symbolic thinking and helps him or her to develop symbolic functioning. These symbolising ego functions enable the development of communication and relationship that are severely impaired in psychotic and borderline psychotic states. (Brooker et al. 2007: 20)

We can see an example of the diagnosed psychotic gaining restorative sense from art-making in a case study presented by the Jungian psychoanalyst and art therapist Joy Schaverien in her article 'Transference and Transactional Objects in the Treatment of Psychosis' (in Schaverien and Killick 2007). Schaverien describes the situation and case history of Lena, a woman suffering from a paranoid psychosis who is admitted to hospital after a serious suicide attempt, where she engages with art therapy. We are presented with images created by Lena, which demonstrate how she uses the practice of art-making to communicate with the therapist who is guiding her, and also as a method of making sense of her own condition and situation which then offers her some degree of counter-actualisation and liberation. *Arrows* is the title of one of Lena's creations (Schaverien and Killick 2007: 28). It is the shape of a basic human figure, outlined in black, intertwined with a yellow wire coiling around the body, as if it were trapped within its physical form. Its basic skeleton is made from a black stick figure and disjointed shapes of white, with an overlay of red lines that seem to indicate the nervous system. Black arrows pierce the outline of this figure and seem to be attacking it like daggers, placing momentous pressure on the body. The figure cries, and tears fall from its eyes and drip down its body. In the background are green vertical lines, with more arrows, which seem to suggest that this is a puppet. It is an intense and simple image, which brings forward an impression of how Lena was feeling when she made it. Schaverien describes how this work then becomes therapeutic for Lena:

> There are no words in this picture which graphically and wordlessly embodies Lena's state. It reveals the pain of the potential fragmentation of psychosis in a way which no words could convey. There are times when words can add nothing to an image: the picture says it all – it is its own vivid and powerful interpretation. . . . Lena was able to communicate her state to me through the vehicle of the picture. . . . Lena realised that it both confirmed her feeling and conveyed it to me because I took the picture very seriously. Lena then began to value her pictures as both an expression of her state and a way of communicating. To speak directly to anyone was to lose herself, but the picture made this possible; it mediated, holding the space in-between us. (Schaverien and Killick 2007: 28–9)

The image offers Lena a method of communicating with the world. It also provides her with a method of getting in touch with how she is feeling and allows her to express this to the therapist. The sense of her illness is somewhat impossible to capture in words, but can

be immediately expressed in the image. By looking at the image, and relating it to her patient, Schaverien is able to gain a sense of the momentous physical pressures that Lena is subjected to, in her tactile hallucinatory experiences, which are indicated by the arrow daggers and the yellow line that encircles the figure. The image is powerful because, as Schaverien says: 'The picture is 'outside' and offers a reflection of some aspect of the self. There is a dawning of consciousness and the beginning of differentiation' (Schaverien and Killick 2007: 24–5). Lena creates an image that helps her to make sense of her being, in terms of the psychotic pressures that she is feeling, and she makes an object which is separate to these pressures, and whose autonomy provides some sense of distance and relief from them. In this way Lena can embody the event of her feeling like a puppet attacked by dagger-arrows, and direct or will her autonomy from it. This results in a connection with her being, and beyond her being, with the therapist, which can counter-actualise the persecutory elements of Lena's inner world and take a step towards a place of healing from them. In this process Lena finds a way to objectify her symptoms, or make an artwork from them, which then reinterprets and so counter-actualises what brings her discomfort and pain. It provides Lena with a method of maintaining a degree of subjectivity in a way that offers her restorative sense. The case of Lena illustrates how

> the inherent communicative value of artistic endeavours seems particularly important for a specialized and idiosyncratic understanding of the schizophrenic person. Moreover, art works of schizophrenics may be not only prognostically significant but also lead to interventions which enhance the problem solving process for both therapist and patient. (Amos 1982: 142)

In this context, emphasis is given to the 'meaning' of the artwork, as though what the client creates has a special and secret meaning beneath its exterior form. I would argue that in fact the meaning of the work is not separate from the process of its physical construction. There is meaning in the process of making because this process has restorative effects in itself. The process of interpreting, or making sense, of what is made also has restorative effects. Making sense is the process of interrogating the sensuous-intellectual data and ideas that constitute the style and content, the elements of the composition, or the abstract machine, that pull the work together. It involves understanding the sense of the here and now – the material presence of the artist-client, their situation, emotions and needs, which charge their creation, and their rapport with the world, the therapist and the materials they are

using. Meaning is immanent in the process of production, interaction and sense-making that constitute the artistic practice and the therapeutic communication it creates. One can relate this to Deleuze's logic of sensation, since here there is a similar dissolution of contradictions, and oppositions in the therapeutic and artistic process dissolve into a plane of immanence, which makes restorative sense. Here restorative does not mean a restoring, or returning to a *previous* state, but a replenishing, nourishing production of the new. Restorative sense is ontogenesis.

Art therapy from a Deleuzian viewpoint is thus not necessarily meant to restore a patient-cum-participant to a previous state of being, nor to realise a teleological goal of perfect health. The point is to open a way by which one can accept one's circumstances, and so create something new from them: to be able to *will* and make a world from them, so that there is a release from their wounding and the possibility for difference is realised. For the artwork provides a means of making sense of oneself and the world, and a paradoxical release-cum-realisation of one in the other, always becoming-other with the immanent sense and transformation involved during the creative process.

One need not have a diagnosed illness in order to benefit from this process. Art-making constructs a 'place of healing' for the schizophrenic, as we have seen, but it is something we can all benefit from. Deleuze might find the involvement of the therapist problematic. The made object can become a talisman that may be interpreted and used to make sense of an illness or disorder; it is thus diagnostic. It can also provide a means of communicating what is inexpressible in words. These factors may require a trained professional who can make sense of the artwork in relation to the client who made it. But in other cases the presence of the therapist is required only to provide the materials with which the patient can interact, and there is no clinical interpretation of what is made beyond sharing the sense one can make during the process of creation itself.

And yet, art therapy may seem counter-intuitive for Deleuzian thinking, when considered alongside his continual efforts to rupture the self, and his employing of models of perversion to define his characteristically violent philosophy. Although such violent thinking might itself raise the need for therapy – remember in Deleuzian thinking 'one courts death' (Deleuze and Guattari 2004a: 177). In any case, we can quite easily draw Deleuzian sense through art in a different context. The artwork made in the context of art therapy can be taken as a form of *Art Brut*. Deleuze himself says that his philosophy produces 'a sort of art brut' (Deleuze 1990: 122). Art Brut is a genre of art created

by Jean Dubuffet in 1948. Originally meant to denote art created by trauma survivors or people with mental illness (whose trauma or illness influences their work), Art Brut refers to artists who are self-taught and who do not participate in the 'mainstream art world' or who operate outside the institutions of Western culture. We can describe the artwork created in a therapeutic setup in accordance with this genre because it requires no training, it often involves making art in response to illness or injury, and it is something that we can all engage with.

Dubuffet presented his manifesto for Art Brut in 1948 as follows:

> Crude Art. We understand by this works created by those untouched by artistic culture; in which copying has little part, unlike the art of intellectuals. Similarly, the artists take everything (subjects, choice of materials, modes of transposition, rhythms, writing styles) from their own inner being, not from the opinions of classical or fashionable art. We engage in an artistic enterprise that is completely pure, basic; totally guided in all its phases solely by the creator's own impulses. It is therefore an art which only manifests invention, not the characteristics of cultural art which are those of the chameleon and the monkey.
>
> Before concluding this essay we want to say a word about the mad. Madness gives man wings and helps his power of vision; many of the objects (almost half) that our exhibition contains are works by people in psychiatric hospitals. We see no reason to segregate them, unlike others. All the numerous dealings that we have had with our friends have convinced us to be quite far-fetched: who is normal? Where is he, your normal man? Show him to us! The artistic act, with the extreme tension that it implies, the high fever that accompanies it, can it ever be considered normal? Finally, mental 'illnesses' are extremely diverse – there are almost as many of them as there are sick people – and it seems quite arbitrary to label them all in the same way. Our point of view is that art is the same in all cases, and there is no more an art of the mad than there is an art of the dyspeptic, or an art for those with bad knees. (Dubuffet 1993: 596)

To think about the sense made in Art Brut, and then see how we might use it to rethink Deleuze's treatment of the schizophrenic, we can turn to the schizophrenic artist Adolf Wölfli (1864–1930). Wölfli lived the majority of his adult life in a Swiss psychiatric hospital, after repeated paedophilic episodes with young children and the diagnosis of schizophrenia. During his time at the Waldau Clinic in Berne, Wölfli began to draw. He was outstandingly prolific, producing 45 volumes, which contained over 25,000 pages and 1,600 illustrations.

His pictures illustrate his psychotic fantasies and delusions. He built his very own world from them, by interpreting his existence in the form

of an autobiographical epic, with fantastical stories of his sainthood and adventures illustrated with kaleidoscopic pages of music, words and colour. For Wölfli art becomes a way of being-in-the-world, since his whole sense of existence is created by his art-making. His creativity becomes the way that he makes sense of his existence and how he deals with life at the psychiatric hospital. This is *raw art*: 'It is Wölfli's greatest achievement that he could create his art both within the domain of his illness and in spite of it. With the pictorial and literary means of this art he was able to express the existential condition that the psychosis forced him to experience, and in so doing, he allows us an insight into his particular *condition humaine*' (Spoerri 1997: 88).

The world that Wölfli created for himself is well illustrated in his picture entitled *General View of the Island Neveranger*. This is a labyrinthine composition created with colour pencil on a sheet of newsprint. It consists of an assemblage of colours, words, musical notes and images, which describe the cartography of a magical space. The piece is infinitely complex, with mandala-like circles bursting with queer creatures, symbols and crosses, the whole composition held together by a skeletal musical stave. One can practically hear a gypsy playing this strange, jolly tune on an accordion to a crowd of skulls with their creepy black eyes, death stares and glum faces. Words are squeezed in all the spaces making the image infinitely complex and utterly engrossing. It is a privilege to be given the chance to see a vision of Wölfli's world. He spent his life locked up; art became his liberation and the source of his sense of being: the realisation (or realising, manifestation, enunciation) of his condition and the counter-actualisation of his suffering. 'Wölfli experienced the 'full collapse in a person' through his illness, and he saved himself by his art, which gave self-assurance to him and meaning to his life' (Spoerri 1997: 88).

Luke Skrebowski argues that Art Brut offers 'a practical approach' for fulfilling Deleuze's schizoanalytic enterprise of 'dismantling the disciplined, unitary self' (Skrebowski 2005: 14–15). He states that by turning to Art Brut one can also fulfil the Stoic philosophy, as outlined in Deleuze's moral philosophy, by activating the kind of philosophy that operates as a 'practice of living', as 'explicitly a practical art, *techne* rather than *episteme*' (5). Skrebowski quotes the Stoic Zeno's aphorism defining art as 'a habit of roadbuilding', in order to emphasise the materiality of Deleuzian thinking and its immediate application as a way of living (5). We can see from the example of Art Brut how Wölfli used his creativity to work out a method of making sense – of both his condition and the world of his delusions – and also a method of being

in the present. Art Brut is defined by untrained artists employing their creativity as a way of life, which is similar to how the Stoics defined their practice of philosophy, and how Skrebowski interprets Deleuzism.

We have seen three possible interpretations of Deleuzian morality through an art practice: Theatre of the Oppressed, art therapy, and Art Brut. These examples have demonstrated how the process of counter-actualisation can be accessed through the creative process of art-making, which then offers a degree of liberation for the artist/patient/participant. As such this creative process acts out a Deleuzian morality, which offers a 'new earth' and 'place of healing' for those who follow it. The individual effects a counter-actualisation and gains restorative sense from the creative process of an art practice.

By now we can begin to see how this creative process might be relevant beyond the situation of the psychotic. To take this further step, we can now turn to Guattari's *Chaosmosis*, a work that confirms the symbiosis we have already seen between ethics/morality and aesthetics, while advocating an art practice in the search for the 'new earth'.[5]

III. Restorative Sense Made: The Ethico-aesthetic Paradigm

The creative process opens up universes of the possible and transversal becomings, as one interacts with material forms and responds to the shifting sense of being – or oneself – that creates with the work. It does not require a therapist to get in touch with the ontogenesis that occurs here, it is something that we can all access. By responding to our being with materials and making an artwork that then composes our presence within the present, we enter into the intrinsic symbiosis between ethics and aesthetics, in accordance with the 'ethico-aesthetic paradigm' that Guattari calls for in *Chaosmosis* (Guattari 1995: 8).

To form a new ethico-aesthetic paradigm we need to think about the implications that the creative process has for subjectivity, for, as Guattari says, a 'pathic agglomeration', or 'constellation of Universes' that are opened up for being (Guattari 1995: 47, 17). The 'artistic cartographies' mapped by the creative process provide what Guattari calls 'a mutant production of enunciation, where expression is not a signifier but a transversal *machine* for the production of difference' (130–1). The artwork formed by this machine is 'the enunciative assemblage'; it is 'a certain mode of aesthetic enunciation' because of the machinery of subjectivation that it opens up for the artist, who can express and counter-actualise their subjection through its creation (14, 29).

For Guattari, this process of creation involves a different kind of subjectivity and a different semiology. It is the realisation of the autonomy, or 'autopoiesis', that provides the definitive sense and ontogenesis of the artwork formed, in the possibilities for difference and restorative sense that it opens for the person who makes it (Guattari 1995: 7). This indicates a semiotics that moves from Hjelmslev's structuralist coupling of Expression/Content and becomes an abstract machine that is not defined by a binary opposition, but as a discursive force with 'energetico-spatio-temporal coordinates' (Guattari 1995: 25). The 'assemblage of enunciation' expressed as the artwork has an existential function – where the symptoms function as an 'existential refrain' in their counter-actualisation and a new mode of subjectivity is invented and becoming (Guattari 1995: 26).

Guattari says that the creative process engenders the invention of new qualities of being. It affirms itself as 'existential nuclei' and 'autopoietic machines', which then provide a new means of communication alongside these new qualities of being (Guattari 1995: 106). The deterritorialised and autonomous segment of the real presented by the artwork has no sign or meaning transcendent to its immanent function of making sense. The sense it makes is one which offers a new way of being-in-the-world:

> The work of art, for those who use it, is an activity of unframing, of rupturing sense, of baroque proliferation or extreme impoverishment, which leads to a recreation and a reinvention of the subject itself. A new existential support will oscillate on the work of art, based on a double register of reterritorialisation (refrain function) and resingularisation. (Guattari 1995: 131)

This creative process defines an art which does not just apply to the activities of established artists, nor just to therapy for the psychotic patient (although we can learn from these examples), but rather offers a subjective creativity 'which traverses the generations and oppressed peoples, ghettoes, minorities…', i.e. which applies to us all (Guattari 1995: 91).

> *How strange the unconscious flow is. Painting can express it. Painting can express anything. Painting is there, even if only to tinker away an afternoon in a mental hospital. Painting is real.*
>
> *Shapes and subjects. What can a farmer who has had a nervous breakdown make of them? Can he be an artist too? Does a scared, sick housewife go back to school to paint? Is the suffering too great to express? Can painting break*

down shyness? Is it fun! No, it isn't fun. It is soothing, however sharp and vicious the badinage of human nature in the therapy room.

Painting, art therapy is an exquisite art. It tells of people and fears. There is dynamo and dynamite in painting. It alleviates suffering and hails freedom, as if no artist was ever frightened of the misery and suffering of the world.

Just think of the universe you can paint. Just think o f all you can paint. It is wonderful.[6]

Notes

1. Perhaps we can use this theatre to play with *Theatre of the Oppressed*, as outlined in part two of this chapter.

Guattari's Aesthetic Paradigm: From the Folding of the Finite/Infinite Relation to Schizoanalytic Metamodelisation

Simon O'Sullivan Goldsmiths College, University of London

Abstract

This article offers two commentaries on two of Félix Guattari's essays from *Chaosmosis*: 'The New Aesthetic Paradigm' and 'Schizoanalytic Metamodelisation'. The first commentary attends specifically to how Guattari figures the infinite/finite relation in relation to what he calls the three Assemblages (pre-, extant, and post-capitalism) and then even more specifically to the mechanics of this relation – or folding – within the third 'processual' Assemblage or new aesthetic paradigm of the essay's title. The second commentary looks at what Guattari has to say about this paradigm in relation to subjectivity, that is, the schizoanalytic programme or practice of metamodelling. Here the focus is on the turn to asignifying semiotics – but also the importance of signifying material and indeed the actual material scene of encounter – in any programme for the production of subjectivity (it is here also that the symptom makes its appearance).

Keywords: Guattari, finite/infinite, chaosmosis, schizoanalysis, metamodelisation, aesthetic paradigm, fold/folding, chaos/complexity

The only acceptable finality of human activity is the production of a subjectivity that is auto-enriching its relation to the world in a continuous fashion.

The machine, every species of machine, is always at the junction of the finite and infinite, at this point of negotiation between complexity and chaos.

Félix Guattari, *Chaosmosis*

I. Introduction

I have argued in a recent article that, as regards the subject, a bar is in operation between the finite and the infinite within much post-Kantian philosophy (O'Sullivan 2009).[1] That article dealt explicitly with the philosophical system of Alain Badiou (as laid out in *Being and Event*) as an example of this kind of topology, comparing it with the system of Gilles Deleuze (in *Difference and Repetition*) where there is no such bar, but rather a continuum of sorts. The present article continues this investigation – of the finite/infinite relation – by looking to Deleuze's erstwhile collaborator, Félix Guattari, and to two essays, 'The New Aesthetic Paradigm' and 'Schizoanalytic Metamodelisation', from his major ontological statement: *Chaosmosis: An Ethico-Aesthetic Paradigm*.[2]

However, before beginning this somewhat technical commentary a brief word about the philosophical orientation of the latter complex work might be useful to set the scene: For Guattari there is always an *a priori* moment of creativity, or simply desire, that prefigures any given entity or any subject-object relation.[3] Indeed, life, in whatever form it takes (organic or inorganic), emerges from a ground of sorts – one that is unfixed and ontologically unstable – that at all times accompanies the very forms that emerge from it. Guattari calls this groundless ground 'chaosmosis', whilst the entities formed from it, although they are given different names, can simply be called subjectivities. Elsewhere I have attended specifically to Guattari's writings on the production of subjectivity in what we might call a political sense (see O'Sullivan 2006a: 87–95). The present article attempts to get to grips with this ontological argument behind the politics, while attending more explicitly to the therapeutic or analytic implications of the ontology, and in particular to Guattari's modelling of a processual and ecological subjectivity *contra* Lacan. This is a modelling in which asignifying components become crucial (although not exclusively so) and in which aesthetic practices play a privileged role.

Two further points are worth noting in relation to the above (and in general on reading Guattari), each of which, at least to a certain extent, works to differentiate his thought from Deleuze's. First, as well as looking to certain philosophical resources, Guattari utilises the paradigm of the new sciences, and especially quantum theory, where he finds the conceptual tools adequate for his processual modelling. This can make *Chaosmosis* a difficult read, especially for those used to a more typical humanities, or even 'continental philosophical' discourse.

Second, even when his writings are most abstract, Guattari is always especially attentive to the vicissitudes of our particular lived late-capitalist situation. This is evidenced in two further preoccupations of *Chaosmosis*: the identification of capitalist or 'universal' time that flattens and reduces local and singular durations; and the emphasis on new technologies that produce an ever increasing alienation and atomisation, but that also have the potentiality to produce new forms of life – and subjectivity – that go beyond the latter. Indeed, Guattari, perhaps more so than any of the other post-'68 French thinkers, holds to this utopian view of technology's promise.

What follows then, are two commentaries of sorts on Guattari's two essays, where commentary is to be understood as involving not just synopsis (although I attempt also to provide this) but also the expansion – and acceleration – of certain aspects of the commented-upon text, as well as occasionally a diversion or digression. Throughout, and especially in the lengthy footnotes, material is drawn in from the other essays of *Chaosmosis* as appropriate and occasional reference is made to Guattari's collaborations with Deleuze. Reference is also made to other thinkers who are either more or less contemporary with Guattari – especially Badiou, Foucault and Deleuze himself – or are important philosophical pre-cursors, for example Spinoza and Bergson. Each of these thinkers, with the exception of Badiou, might be said to be working within a similar aesthetic paradigm to Guattari's in the sense of positing a mind-body parallelism and in attempting a mode of thought beyond the subject-object split. In what follows then, when these thinkers do make an appearance it is because they can add something – from their own diagrams as it were – to Guattari's own particular diagram of the infinite/finite relation.

II. The Three Assemblages

At the very beginning of 'The New Aesthetic Paradigm' Guattari makes the important point that art, considered as a separate autonomous activity, is a relatively recent development in our world and that before this it was part of what we might call the general practices of life and of living. This is, as Guattari points out, difficult to appreciate as the past is invariably understood from the perspective and also the logics and interests of the present. Although specific instances of contemporary art might then be part of the aesthetic paradigm, the notion of art in general can stymie access to the latter in that it reduces aesthetic practice to a specialism. In a first definition then, the aesthetic paradigm might be

thought of as an expanded field of creative life practices that are not necessarily restricted to what is typically considered art, and, as such, this paradigm certainly has something in common with previous or pre-modern paradigms.

We are not, however, fully within this expanded aesthetic paradigm, but rather experience and produce the latter through a number of distinct practices each of which operates as an interface between the finite and infinite. Such practices, which include 'science, technology, philosophy, art and human affairs', are involved in their own distinct explorations and experiments (100). They conduct their local enquiries following their own logics and using their own particular means. With art it is 'the finitude of the sensible material' that 'becomes a support for the production of affects and percepts which tend to become more eccentred with respect to performed structures and coordinates' (100–1). Art involves a finite assemblage that presents the infinite to us in a specifically different and singular manner in *contra* distinction to the more typical assemblages that surround us on a day-to-day basis. In fact, this 'metabolism of the infinite' might be figured as moving in two directions: from the finite to the infinite but also as a 'movement from infinity to the passage of time' (101). In passing it is worth noting that this movement is also transversal in another sense, in that a 'mutation' in one practice or particular area of life can have effects on another. As opposed to a thinker like Badiou, for whom an event's effect is solely vertical as it were, here the event – of the finite presenting the infinite/the infinite becoming embodied in the finite – is horizontal, working *across* milieus. This is to map out an immanent field of events (or infinite/finite interfaces) without a supplementary dimension above or behind them. I will return to this below.

As we shall see, the aesthetic paradigm, which is implied in art practice though not fully realised, has a particular privileged role to play in the production of subjectivity in our contemporary world. Aesthetics in general, however, or what Guattari calls 'a dimension of creativity in a nascent state', is also characteristic of pre-capitalist societies that are involved in the production of 'polysemic, animistic, transindividual subjectivity' (aspects of which can also be found in our time in the 'worlds of infancy, madness, amorous passion and artistic creation') (101). Guattari describes this first type of territorialised Assemblage as follows:

> Polyphonic spatial strata, often concentric, appear to attract and colonise all the levels of alterity that in other respects they engender. In relation to them,

> objects constitute themselves in transversal, vibratory position, conferring on them a soul, a becoming ancestral, animal, vegetal, cosmic. These objectities-subjectities are led to work for themselves, to incarnate themselves as an animist nucleus: they overlap each other, and invade each other to become collective entities half-thing, half-soul, half-man, half-beast, machine and flux, matter and sign... (102)

This then is a *proto*-aesthetic paradigm in which the distinctions of subject-object have yet to be fixed and reified, a world of strange mutually implicated beings cohering around objects and practices (in 'Machinic Heterogenesis' Guattari presents a case study, following Marc Auge, of just such a complex practice in the voodoo object/ritual/belief of 'Legba' [46]).[4] It is also a world in which 'the spheres of exteriority are not radically separated from the interior', but rather implicated in a general folding that is also a reciprocal fold of the infinite and the finite (102). As Guattari remarks: '[h]ere there is no effort bearing on material forms that does not bring forth immaterial entities. Inversely, every drive towards a deterritorialised infinity is accompanied by a movement of folding onto terrritorialised limits...' (103).

The second kind of deterritorialised Assemblage – the capitalist regime proper – involves an ordering and reduction of the first. It 'erects a transcendent autonomised pole of reference' over and above what we might call the multiplicity of worlds evident in the previous regime (103). This is the instalment of dualisms or binary oppositions each of which necessarily involves the setting up of a privileged term. This might involve fixing a transcendent 'Truth', or notion of the 'Good', the 'Beautiful' and so forth, but crucially it is also the implementation of Capital as ordering principle of lived life and the concomitant reduction of heterogenetic multiplicity to the principle of exchange. This then is a flattening (exchange principle) and also a hierarchisation (with Capital at the apex). We might say that such a regime is one that subjects its people (albeit a subjection often masked by slogans invoking individual freedom and the possibilities of participation: Nike's 'just do it!' and the like). In technical terms, it involves a 'segmentation of the infinite movement of deterritorialisation' (the latter, as argued in *Anti-Oedipus*, being the determining factor of capitalism in so far as capitalism *is* desire) that 'is accompanied by a reterritorialisation' (again, following *Anti-Oedipus*, this capture might be thought as the second moment of capitalism – the capture, or siphoning off of surplus value from the flows of desire) (103).[5] In this Assemblage then, '[t]he valorisation which, in the preceding illustration, was polyphonic and rhizomatic, becomes bi-polarised' (103). Here subjectivity is under the rule of the 'transcendent

enunciator', held in a constant state of lack, debt, procrastination and so forth (104). Immanence is captured by a transcendent apparatus and, as such, subjectivity is standardised through the neutralisation of difference.[6]

The above two Assemblages cannot be reduced to specific epochs for they can, and invariably do, co-exist within the same period (for example, animist beliefs and practices co-exist with advanced capitalism in the hyper-modern culture of Japan). Likewise, the third Assemblage is present within our own – although only in an embryonic state. It bears some relation to the first, but crucially does not involve a simple return (if this were ever a real possibility), but, we might say, a return that is itself coloured by its passage through the second Assemblage. Certainly, the third Assemblage, the aesthetic paradigm proper, has in common with the first that the interiority of atomised individuated subjects is exploded and that a multiplicity of different regimes and practices are implicated.[7] However the difference – between first and third – is important. As Guattari remarks:

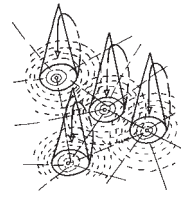
> One does not fall back from the regime of reductionist transcendence onto the reterritorialisation of the movement of infinity in finite modes. The general (and relative) aestheticisation of the diverse Universes of value leads to a different type of re-enchantment of the expressive modalities of subjectivity. Magic, mystery and the demonic will no longer emanate, as before, from the same totemic aura. Existential Territories become diversified, heterogenised. (105)

This affirmation of difference is then not animist in the sense of the first paradigm. It is not, we might say, a return to a pre-individual subjectivity composed of a-personal strata. For, as Guattari goes on to say: 'The decisive threshold constituting this new aesthetic paradigm lies in the aptitude of these processes of creation to auto-affirm themselves as existential nuclei, autopoietic machines' (106). Difference, or alterity, is then cohered together rather than dispersed as in the first Assemblage. I will be returning below to the crucial question of how this existential 'stickiness' takes place, but we can note here that it involves the invention of 'mutant coordinates' (106). Indeed, ultimately, it is art's capacity to engender 'unprecedented, unforeseen and unthinkable qualities of being' through the invention of such different coordinates that gives it a privileged place within the third Assemblage (106). As Duchamp once remarked (and as quoted by Guattari): 'art is a road that leads towards regions which are not governed by time and space' (101).[8]

It is also important to remember that, as noted above, this third Assemblage will be marked by its passage through the second. In fact, I would argue it involves an implementation of sorts of the strategies of the second albeit with a significantly different orientation and for different ends: whereas there is a general *over*-coding in the second, here there is the instalment of *local* coding or singular points of organisation. We might usefully turn to the late writings of Foucault at this point and insert the diagram of 'the care of the self' into Guattari's aesthetic paradigm. Here, subjectivation, or the active production of subjectivity by the subject itself, involves a particular relationship to any outside transcendent organiser. In fact, it involves what we might call a 'folding-in' of transcendence within the subject (or, in Foucault's terms, the application of 'optional rules' to oneself).[9] For both Foucault and Guattari it is this 'folding-in' of the outside – by the subject on his or her own terms – that constitutes a freedom of sorts from subjection. It is, as it were, a certain intention and orientation that will also involve a programme (Foucault's technologies of the self/Guattari's metamodelisation) in which the subject, ultimately, assumes its own causality (or in Lacan's paradoxical claim 'becomes a cause of itself').

It is here that we can also see the logic of Guattari's interest in the new sciences inasmuch as they involve a similar reorientation from a transcendent Truth to what Guattari calls 'operational modelisations that stick as close as possible to immanent empiricism' (106). This is the privileging of points of view over any objective and universal Archimedean point. It is also the operating logic of schizoanalysis that itself involves a turn away from the standard and normalising models of psychoanalysis, tied as they are to the second Assemblage (106). It is only a short step from this to Guattari's theory of metamodelisation, understood as a theory of the auto-composition of different models of subjectivity that involves the incorporating, repositioning – and implicating – of the models of the first and second Assemblages (106).

Guattari gives us a succinct description of how this new kind of Assemblage implies a different mode of organisation – or 'crystallisation' – that draws on the two previous Assemblages: 'No longer aggregated and territorialised (as in the first illustration of Assemblage) or autonomised and transcendentalised (as in the second), they are now crystallised in singular and dynamic constellations which envelop and make constant use of these two modes of subjective and machinic production' (108). The third Assemblage is then a composition of sorts that involves components of both the previous:



a 'folding-in' of the transcendence of the second Assemblage that in itself produces autopoietic nuclei around which the fields of alterity of the first Assemblage might crystallise. This is also to fold the outside – or infinite – within; to produce a relation to one's self that is akin to self-mastery (when the latter is understood also as self-organisation).[10] In this aesthetic paradigm we become the authors of our own subjectivities. This is not however solely the production of separate and isolated monads, for such an autopoietic folding is always accompanied by an allopoietic function in which a given subject maintains lines of connection – or 'multidirectional relays' – to an outside, including other subjects (114). In fact, each monad is always already ontologically related inasmuch as they are constituted on the same plane of immanence or 'ground' of the first Assemblage. In passing it is worth remarking that the actual political work of locating non-transcendent commonalities within the third Assemblage – or, we might say, of developing a politics of singularity – must invariably be one of continuous experimentation and testing; it cannot be given in advance as a general, or transcendent rule. To conclude this first section we might then diagram the three Assemblages and their attendant subjectivities thus:[11]

1. Territorialised Assemblage
Pre-Capitalist (trans-individual)
(Immanence/animist)

2. Deterritorialised Assemblage
Capitalist (individual)
(Transcendent over-coding)

3. Processual Assemblage
Post-Capitalist (post-individual)
('Folding-in' of transcendence/
autopoietic nuclei)

plolysemic/collective **standardisation/reduction** **autonomous/singular**

Figure 1. The Three Assemblages

III. Folding the Infinite

We come now to the more technical part of Guattari's essay with the laying out of precisely how this interface between the finite and the infinite – or between the subject and the object – operates. Guattari's claim for his 'transversalist' theorisation of enunciation (that applies as much to specific practices as it does to the very cosmos itself)

is that it establishes a bridge of sorts between the finite and the infinite, and, crucially, 'postulate(s) the existence of a certain type of entity inhabiting both domains, such that the incorporeals of value and virtuality become endowed with an ontological depth equal to that of objects set in energetico-spatio-temporal coordinates' (108). In Guattari's words 'these transversal entities appear like a machinic hypertext', and further, imply that 'Being', far from being pre-established, or operating as some kind of container for life (or for 'all the possible modalities of being'), is, in fact, 'auto-consistency, auto-affirmation, existence for-itself deploying particular relations of alterity' (109). This self-crystallisation, or form constituting itself from the formless, applies as much to non-human and indeed inorganic life as is does to the human (after all, even molecules, as assemblages, have a virtual aspect). Guattari calls this active, generative and transversal process 'machinic being' (109).[12] Such machines, or self-organising entities, have then two specific aspects – or face in two directions: towards the finite and towards the infinite:

> The machinic entities which traverse these different registers of the actualised world and incorporeal Universes are two-faced like Janus. They exist concurrently in a discursive state within molar fluxes, in a presuppositional relationship with a corpus of possible semiotic propositions, and in a non-discursive state within enunciative nuclei embodied in singular existential Territories, and in Universes of ontological reference which are non-dimensioned and non-coordinated in any extrinsic way. (110)

The precise nature of these entities which face the virtual (the 'non-discursive, infinite character of the texture of these incorporeals') and the actual (the 'discursive finitude of energetico-spatio-temporal Fluxes and their propositional correlates') is unclear, but the manner of this strange co-existence involves speed (110).[13] For Deleuze, reading Spinoza, this would be the absolute speed of the Third Kind of Knowledge that surveys all things at the same time in eternity.[14] Here, for Guattari, it is Pascal who defines the operation of these entities as 'a point which moves everywhere at infinite speed because it is at all places and whole in each place' (110, Guattari quoting Pascal). Only such 'an entity animated by an infinite speed... can hope to include both a limited referent and incorporeal fields of possibles' (110).

For Guattari, however, this Pascalian modelisation is not enough, producing as it does 'an ontologically homogeneous infinity' (110). The aesthetic paradigm is more generative and productive than this, involving 'more active and activating folds of this infinity' (110). In order

to develop this line of argument, Guattari introduces here a further two terms, somewhat synonymous with the infinite and the finite, namely chaos and complexity. Each of the latter interpenetrates the other in a chaosmic folding – with the entities traversing the two fields. Here is the crucial passage from Guattari on this finite-infinite weave:

> It is by a continuous coming-and-going at an infinite speed that the multiplicities of entities differentiate into ontologically heterogeneous complexions and become chaotised in abolishing their figural diversity and by homogenising themselves within the same being-non-being. In a way they never stop diving into an umbilical chaotic zone where they lose their extrinsic references and coordinates, but from where they can re-emerge invested with new charges of complexity. It is during this chaosmic folding that an interface is installed – an interface between the sensible finitude of existential territories and the trans-sensible infinitude of the Universes of reference bound to them. (110–11)

This oscillation gives the entities their character of consistency *and* dissolution, of complexity *and* chaos. Furthermore, the difference between the two milieus does not amount to a dualism as such given that both 'constitute themselves from the same plane of entitative immanence and envelop each other' (111). We might at this point insert Bergson's cone of memory from *Matter and Memory* into the Guattari diagram and point out that although there may indeed be no binary opposition between the two realms – of the actual and the virtual – there is nevertheless a difference in kind.[15] Without this difference the infinite, or virtual, would not be a force of creation and difference but would remained tied to the plane of matter and to the logic of the possible (the entities would always be just 'more of the same' as it were). As Deleuze remarks – and the same might be have been said by Guattari – this virtuality does not lack reality, only actualisation (cf. Deleuze 1988b: 96–7). The virtual is then not a transcendent realm above the actual but is its very ground, the stuff from which the actual is actualised as it were. It is in this sense that we can understand chaosmosis as itself virtual. This is immanence without a supplementary dimension and implies a non-hylomorphic (or self-organising) thinking of matter.

Indeed, Guattari points out that the 'primordial slowing down manifested in finite speeds' is already present *in* chaos (112), or simply that 'infinite speeds are loaded with finite speeds' (113). We might say that chaos already contains complexity and that complexity is always already composed out of a chaos from which it emerges and towards which it returns.[16] Furthermore, this chaosmic texture is lumpy, as it

were. It is in fact less a case of an oscillation between two distinct and absolutely separate fields than of multiple encounters between different entities that are composed out of these two fields.[17] These entities, as well as being spatially heterogeneous, will also be so temporally. They will keep time in different ways, each individual entity vibrating at a different frequency, or, in Bergsonian terms, implicating a different duration. This is to posit a kind of patchwork of different rhythms or refrains. The present is never temporally homogeneous in this sense, but is always a multiplicity of these space-time machines.[18]

Here is the second crucial statement from Guattari on the finite/infinite relation:

> So chaosmosis does not oscillate mechanically between zero and infinity, being and nothingness, order and disorder: it rebounds and irrupts on states of things, bodies and the autopoietic nuclei it uses as a support for deterritorialisation; it is relative chaotisation in the confrontation with heterogeneous states of complexity. Here we are dealing with an infinity of virtual entities infinitely rich in possibles, infinitely enrichable through creative processes. (112)

The relationship between virtual and actual, between infinite and finite is then incarnated in different entities in an entirely reciprocal manner. As Guattari remarks: 'the same entitative multiplicities constitute virtual Universes and possible worlds' (113), or, as he also says, '[t]he movement of infinite virtuality of incorporeal complexions carries in itself the possible manifestation of all the components and all the enunciative assemblages actualisable in finitude' (112). The entity – and here perhaps we should also say the subjectivity – is at once a part of the world and apart from the world. More accurately, it has a part of itself in the world as actualised but also a part in that groundless ground – the virtual – from which it has been actualised. But crucially this is not a split subject as such (there is no bar between the two), and as such neither is it a melancholy subject (a being barred from the infinite in its very finitude). Rather it is a subject that is always already eternal, composed of different speeds all the way up to the infinite. A properly Spinozist subject.

Guattari suggests that the production of this entity necessarily involves a 'grasping' of the infinite that in itself involves an ontological slowing down. This – a gestural semiotics that has precursors in ancient Greek epistemology, but that is equally a product of Guattari's knowledge of phenomenological psychiatry – implies a meeting of sorts with something that provides some kind of friction: '[a]n incorporeal complexion,

snatched up by grasping, will only receive its character of finitude if the advent-event of its encounter with a trans-monadic line occurs, which will trigger the exit, the expulsion of its infinite speed, its primordial deceleration' (114). The entity or 'complex entitative multiplicity' has to be cohered, or 'indexed' to use Guattari's term, by 'an autopoietic nucleus' (114). This moment of grasping and of slowing occurs then when the complex-chaotic field of the infinite encounters what Guattari calls a 'trans-monadism' (114). The latter introduces within chaos an 'ordered linearity' that allows 'the ordination of incorporeal complexions to crystallise' (114). Guattari likens this process to 'the pickup head of a Turing machine' arguing that 'linearity, the matrix of all ordination, is already a slowing down, an existential stickiness' (115).[19] Like a tape-head that spools tape, or perhaps a turntable stylus that picks up dust and static, '[t]he chaotic nothing spins and unwinds complexity' carrying out 'an aggregative selection onto which limits, constants and states of things can graft themselves' (114). This is then the second, more active folding of chaosmosis that produces a teeming ecology of entities, a virtual-actual life world. In Guattari's arresting phrase, it is 'the 'choice' of finitude' (116): 'Transmonadism through the effect of retro-activity crystallises within the primitive chaotic soup spatial coordinates, temporal causalities, energy levels, possibilities for the meeting of complexions, a whole ontological "sexuality" composed by axiological bifurcations and mutations' (115).

It is this transmonadic line, an 'infinite twisting line of flight', that slows chaos down, in the process organising it and giving it a consistency (116).[20] Ultimately then, what is at stake in this new paradigm is the tracking of this creative and experimental line of flight, which we might call, following the analysis of the three Assemblages above, a 'folded-in' transcendence. This line, which is also an autopoietic nucleus or, in the language of the new sciences, a 'strange attractor', involves the production of unforeseen new infinite/finite diagrams, which is to say, precisely the production of new subjectivities, different, more flexible and processual than those typically produced within and by the second Assemblage discussed above.[21] This, finally, is the aesthetic paradigm proper, or the production of 'new infinities from a submersion in sensible finitude, infinities not only charged with virtuality but with potentialities actualisable in given situations...' (117). Such a paradigm also enables us to redefine politics and ethics around these processes of singularisation as specifically productive and generative pursuits. This will involve breaking with consensus, reduction, standardisation, and what Guattari calls 'the infantile "reassurance" distilled by dominant

subjectivity', as well as the affirmation of a 'heterogenesis of systems of valorisation and the spawning of new social, artistic and analytic practices' (117).[22] Ultimately it is a call to participate in the auto-production of our own subjectivities, that in itself implies an auto-relationship to ourselves (the folding-in). This will mean drawing our own diagrams of the infinite/finite relation and mapping out our own terrain of their operation. It is to the pragmatics of this specific cartographic operation that we will now turn.

IV. Metamodelisation

What precisely are the mechanisms or technologies that would allows us to produce ourselves differently, or, in the terms of the above commentary, to rearticulate our own relationship with the infinite and thus constitute ourselves as different finite/infinite composites? Put bluntly, what are the practical and pragmatic implications for the production of subjectivity of the new aesthetic paradigm as Guattari outlines it? These questions can be approached by way of the essay on 'Schizoanalytic Metamodelisation', wherein we find Guattari's distinct and complex *analytic* take on the production of subjectivity. In fact, Guattari pitches his theory of metamodelisation against what he sees as a bankrupt psychoanalysis that, as a form of structuralism, insists on reducing all aspects of semiotic modelling to 'syntagmatic articulations' in which any 'points of ontological crystallisation', for example 'phonological gestural, spatial, musical, discursivities', become 'annexed to the same signifying economy' (59–60). Psychoanalysis, for Guattari, is then a paradigmatic example of the second Assemblage as explored above. In its place Guattari lays out his own system and anti-structure of sorts that attends specifically to a more expanded semiotics (asignifying and signifying) *and* to the processual nature of the production of subjectivity that in itself foregrounds the singular and local nature of each crystallisation of Being. We can see immediately that this schizoanalytic project is implicit in the aesthetic paradigm, and, as such, involves the production of subjectivities leading from the third Assemblage discussed above.

In order to theorise this schizoanalytic programme – or theory of metamodelling (the two terms are used more or less synonymously) – Guattari provides his own distinct articulation of the four ontological functions that determine any given 'discursive system' or 'refrain of ontological affirmation' (60).[23] They are as follows:

	Expression actual (discursive)	**Content** virtual enunciative nuclei (non-discursive)
possible	Φ = machinic discursivity	**U** = incorporeal complexity
real	**F** = energetico-spatio-temporal discursivity	**T** = chaosmic incarnation

Figure 2. 'The Assemblage of the Four Ontological Functions', Diagram from Guattari's 'Schizoanalytic Metamodelisation', *Chaosmosis* (60)

Guattari's organisational schema owes much to Hjemslev, from whom the expression/content framework is taken (and which is Guattari's response to the Saussurean signifier/signified framework determinant in Lacanian modelisations). Any given being – or enunciative assemblage – might be seen to be constituted across these four realms. As far as the real goes, F denotes the actual constitution of any given entity within space and time, whilst T denotes the chaosmosis out of which that entity has emerged (and towards which it tends in a movement of its own dissolution). On the possible side, Φ denotes the actual machinic nature of the entity – its autopoietic and allopoietic character as it were, whilst U denotes the virtual 'universes of reference' or 'incorporeal complexity' that are available to, or opened up by, this machinic discursivity.[24]

The key intention here is to complexify rather than reduce the components that make up any given instance of subjectivity (especially those that instigate the reign of a master signifier or any rule of transcendence [again, as in the second Assemblage]). The above box – or matrix – thus allows for a multiplicity of different pathways and arrangements to be diagrammed. This is schizoanalytic metamodelisation. As Guattari remarks:

> Schizoanalysis does not... choose one modelisation to the exclusion of another. Within the diverse cartographies in action in a given situation, it tries to make nuclei of virtual autopoiesis discernible, in order to actualise them, by transversalising them, in conferring on them a diagrammatism (for example, by a change in the material of Expression), in making them themselves operative within modified assemblages, more open, more deterritorialised. Schizoanalysis, rather than moving in the direction of reductionist modelisations which simplify the complex, will work towards

> its complexification, its processual enrichment, towards the consistency of its virtual line of bifurcation and differentiation, in short towards its ontological heterogeneity. (60–1)

Guattari's metamodelisation is thus an attempt to proliferate models and also to combine models, or parts thereof, which might otherwise be seen as non-compatible.[25] Crucially, the 'nuclei of partial life', which hold the assemblage or entity together (and which are, as we have seen, determinant in the third Assemblage above) involves a kind of 'self-knowledge' of 'being-in-the-world' that 'implies a pathic apprehension which escapes energetico-spatio-temporal coordinates' (61). At stake then is a kind of auto-cohesiveness – or rhythm – that operates *prior* to signification. Nevertheless, this self-constitution might well involve narration as a secondary cohering mechanism of sorts:

> Knowledge here is first of all existential transference, non-discursive transitivism. The enunciation of this transference always occurs through the diversion of a narration whose primary function is not to engender a rational explanation but to promote complex refrains, supports of an intensive, memorial persistence and an event-centred consistency. It is only through mythical narratives (religious, fantasmatic, etc.) that the existential function accedes to discourse. (61)

Guattari's argument here is that such 'narration' operates as a refrain, which is to say it is stripped of its signifying and discursive function in favour of the 'existential transference' of the non-discursive. Guattari gives us two examples of just such narrative refrains, or what we might call myth-systems: Christianity, which ultimately produces a 'new subjectivity of guilt, contrition, body markings and sexuality. Of redemptive mediation . . .'; and Freudianism, which produces an 'Unconscious presented as universe of non-contradiction' and a pragmatics of 'transference and interpretation' (62). For Guattari, Freud himself was in fact a veritable inventor of concepts and narratives, opening up vast new possibilities for the modelisation of subjectivity, but Freudianism 'quickly encountered limits with its familial and universalising conceptions, with its stereotyped practice of interpretation, but above all with its inability to go beyond linguistic semiology' (63). Freudianism, we might say, involved a petrification of the generative models of Freud, and a reduction of the latter to a wholesale signifier enthusiasm.

Crucially, whereas for psychoanalysis it is neurosis that operates as model, for schizoanalysis, following this notion of metamodelisation, it is psychosis: '[b]ecause nowhere more than here is the ordinary

modelisation of everyday existence so denuded; the "axioms of daily life" stand in the way of the a-signifying function, the degree zero of all possible modelisation' (63). It is this confrontation with chaos (over which the above narrations are cast, as it were) that positions psychosis in such a privileged position as regards metamodelisation (and indeed the aesthetic paradigm more generally). As Guattari remarks: 'The schizo fracture is the royal road of access to the emergent fractality of the Unconscious' (64). As such, psychosis is not just an illness or aberration, but also an indication of, and insight into, our own ontological condition as chaosmotic entities:

> Psychosis is not a structural object but a concept; it is not an irremovable essence but a machination which always starts up again during any encounter with the one who will become, after the event, the psychotic. Thus here the concept is not an entity closed in on itself, but the abstract, machinic incarnation of alterity at the point of extreme precariousness; it is the indelible mark that everything in this world can break down at any time. (64)

As well as involving asignifying rupture, psychosis also has its own narration – or produces its own myths (idiosyncratic, local, often strategic). Indeed the psychotic is a prodigious inventor of stories and concepts, and, like anyone else, has his own refrains that cohere a self or multiple selves, however fragile and transitory these might be (I will return to this below). Metamodelisation is, then, an anti-structure of sorts in which different elements (signifying and asignifying, discursive and non-discursive) become loosened, moving between terrains, migrating across the four quadrants of Guattari's model. Guattari introduces Daniel Stern's child ethology as paradigmatic of this new and more fluid modelling of relations, involving as it does a mapping of the infantile world or 'primary assemblage of subjectivation' that involves existential territories and incorporeal universes that have yet to be fixed on the father, mother, and so forth (65). Crucially this emergent self ('atmospheric, pathic, fusional, transitivist') is not itself a phase 'since it will persist in parallel with other self formations and will haunt the adult's poetic, amorous and oneiric experiences' (66).[26] In the collaboration with Deleuze, this emergent self is redefined as a 'becoming-child'; not a nostalgic return to childhood but the mobilisation of 'blocs of childhood' within a so-called 'adult' life. Becoming-child is just one moment in an ongoing series or processual programme that ultimately involves less human becomings, even inorganic ones (and, as such, we can understand one of the key

preoccupations of *A Thousand Plateaus* in terms of an exploration of the resonances between the first and third Assemblages discussed above).[27]

A further important developmental aspect of this emergent self is the discovery of 'sharable affects', or the 'recognition of the fact that the other can experience something that the subject experiences for itself' (67). The emergent self (that continues throughout life, but is habitually 'masked' or erased by typical subjectivity) is one that knows no subject-object duality. 'It is at the heart of this proto-social and still pre-verbal Universe that familial, ethnic, urban, etc., traits are transmitted' (67). Further phases follow, including the entry into language, but again, these phases – which we might also call, following Guattari's terminology, 'Universes of reference' – are not sequential but are rather 'superimposed in a kind of incorporeal existential agglomeration' (67). This is a crystallisation rather than a topology, a complex assemblage in which any given universe might foreground – or actualise – itself at any given time. Just as each of the three Assemblages are superimposed on one another within our own epoch, so the different aspects of a 'self' or a given subjectivity are likewise layered in a kind of palimpsest. Indeed, one might say that schizoanalysis, like the aesthetic paradigm more generally, involves the locating of an access point – or line of flight – from a given petrified individuality or transcendent mode of organisation. It is in this context that we must understand Guattari's paradigmatic redefinition of the symptom, in this case the lapsus, which becomes 'not the conflictual expression of a repressed Content but the positive, indexical manifestation of a Universe trying to find itself, which comes to knock at the window like a magic bird' (68). Here the semiotic (the index), the ethological (the bird against the glass) and the discursive (the scenario as metaphor) are combined in a modelling in which the symptom is no longer proxy from an unconscious that is always already there, but rather a precursor of an unconscious that is yet to come. The only way to 'shift petrified systems of modelisation' (and to open up to more expanded versions of the latter) is to follow these symptoms, to cross the barriers of non-sense and access 'asignifying nuclei of subjectivation' (68). We might say that, in Guattari's system, the symptom offers an escape route from the impasses of the present, or, simply, belies the very presence of the infinite within the finite.

However, as we have seen, the rupturing of given signifying regimes is only one of the gestures of schizoanalysis. The other is more constructive and might well involve the reintroduction of signifying material – alongside other material – in a local and singular modelisation. In fact, I would argue that this utilisation of signifying material might

be figured in three temporal sequences. First, it might come *after* the accessing of any asignifying nuclei. This would be a retroactive recognition, as it were, an 'Ah, so that's what it was!', or even an 'Ah, so that's me!'[28] It might also, however, operate *prior* to the asignifying nuclei as a kind of platform or catalyst. Here signifying material is predictive, even prophetic. In both these cases what is at stake, as mentioned above, is the production of alternative narratives and myth-systems. I would argue that this is a kind of performative 'fictioning' in the sense that it will take existing signifying materials – with their order words and master-signifiers – but reorder or reframe them in a local and singular constellation (and for different ends). We might say here that fiction can operate as the friction – the cohering mechanism – discussed above. A third moment might be the use of signifying material in *parallel* with any asignifying moment. Here writing, for example (as Foucault notes in his comments on the ancient Greek practice of self-writing, or *hupomnemata*), itself operates as a pragmatic technology in the actual processual production of subjectivity.[29] This is not to re-privilege the signifying over the asignifying but to note that the signifying element cannot be ignored (and in fact Guattari is always at pains to point out that signifying semiotics play their part in schizoanalysis).[30]

A confrontation with chaos then, but also the concomitant construction of an assemblage to give the latter consistency, to make it *workable*. This programme need not be abstract (although having an abstract diagram will foster a more general or generic applicability). Indeed, it might simply involve the encounter and use of different elements of the world/the body – signifying *and* asignifying – in a specifically different manner. In relation to this, Guattari gives us the example of the treatment of a psychotic. The description amounts to a succinct statement of the method of schizoanalysis:

> The treatment of a psychotic, in the context of institutional psychotherapy, works with a renewed approach to transference, focused henceforth on parts of the body, on a constellation of individuals, on a group, on an institutional ensemble, a machinic system, a semiotic economy, etc. (grafts of transference), and conceived as desiring becoming, that is to say, pathic existential intensity, impossible to circumscribe as a distinct entity. The objective of such a therapeutic approach would be to increase as much as possible the range of means offered in the recomposition of a patient's corporeal, biological, psychical and social Territories. (68)[31]

We are given the example of the kitchen at *La Borde* as just such a complex arena of heterogenetic encounter, a machinic assemblage

and veritable 'opera scene' of resingularisation (69). In such an assemblage, '[s]chizoanalytic cartography consists in the ability to discern those components lacking in consistency or existence' (71), and consequently in reintroducing them (or others) so as to allow individuals to resingularise themselves (or simply to creatively break debilitating patterns and petrified modellings – and produce new ones). In this respect it is especially the collective nature of institutional analysis that is important, when this collectivity is understood as operating at both the molecular and molar register, as sub- and supra-individual. To quote Guattari:

> Note that collective is not here synonymous with the group; it is a description which subsumes on the one hand elements of human intersubjectivity, and on the other pre-personal, sensitive and cognitive modules, micro-social processes and elements of the social imaginary. It operates in the same way on non-human subjective formations (machinic, technical and economic). It is therefore a term which is equivalent to heterogeneous multiplicity. (70)

This emphasis on collectivity, especially in terms of the pre-personal, involves a 'repudiation of the universalist and transcendent concepts of psychoanalysis which constrain and sterilise the apprehension of incorporeal Universes and singularising and heterogenetic becomings' (72).[32] Indeed, Guattari's metamodelisation is here, once more, pitched specifically against the 'fundamental linearity' of the Lacanian signifier that 'homogenises the various semiotics' and thus 'loses the multidimensional character of many of them' (22). As an illustration of this colonising function of the signifier Guattari gives us the example of Lacan's interpretation of Freud's Fort-Da game. For Freud it is a game of absence and presence (of the mother) and ultimately of a repetition compulsion that moves towards death. Lacan, instead, 'ties it down to the signifying discursivity of "existing language" ': '[t]hus the reel, the string, the curtain, the observer's gaze, all the singular characteristics of the assemblage of enunciation fall into the trap of the Signifier' (74).

Schizoanalysis, on the other hand, will attend to the asignifying semiotics of the game that have been 'overlooked' in this interpretation, 'recognising that with this refrain the child encounters unforeseen Universes of the possible, with incalculable, virtual repercussions. . . '.[33] Here the Fort-Da assemblage is less a theatre of language (or the playing out of an oedipal drama) than a 'desiring machine', 'working toward the assemblage of the verbal self – in symbiosis with the other assemblages of the emergent self – and thereby inaugurating a new mastery of the object, of touch, of a spatiality. . . ' (74–5). Guattari does not dismiss the

Lacanian theorisation *tout court* (as we have seen, signifying economies of narrative might well be crucial in cohering a subject), but places it along side other modelisations in a more expanded analytic framework.

Worth noting here is also Guattari's own take on Freud's insight regarding repetition and the death drive. For Guattari it is less the 'encounter or relation of intimate intrication between two distinct drives, Eros and Thanatos, [than] a coming and going at infinite speed between chaos and complexity' (75). A reciprocal relation between consistency and its loss, between 'differentiated complexion' and 'chaosmic submersion' (75). In the terms of the present essay, it is a relation – reciprocal, always in process, fragile and dynamic – between the finite and the infinite. We are then at the heart of schizoanalytic metamodelisation returned to Guattari's ontology, which informs his analytic framework and is informed by it. It is a post-human ontology and practice (inasmuch as the human is invariably a transcendent apparatus – or projection on to immanence), one in which Freud's decentring of the subject (in relation to the drives) is further deterritorialised on to an even more general field of 'chaosmic immanence' (75). The important point here is that individuation from this field, when it does occur, need not necessarily lie along typical lines or involve those habitual patterns that invariably produce atomised and alienated 'individuals'.[34] Indeed, the goal of schizoanalysis is precisely to reconnect the petrified models of subjectivity to the field of desire from which they have been extracted, a technique that involves a confrontation with chaosmosis but then also that one models it differently, utilises other models alongside the more familiar ones, and holds all models lightly and strategically.[35]

For Guattari this metamodelisation, which involves the production of new kinds of relation to our own finitude as well as to the infinite of which we are part, has, of course, a pressing urgency given our present ecological crises.[36] Indeed, the dominant paradigm of subjectivity today involves, as we saw in the first part of this essay, an homogenisation of life and its capture by transcendent points, especially the exchange principle. This is the organisation of subjectivity around money and material production solely for its own sake (a subject that sees the world as separate object and purely as a resource to be exploited). Such a subjectivity cannot but involve a certain kind of blindness, or wilful ignorance, both to its own finitude (and that of the world), *and* to those virtual ecologies – the infinite – of which it is an actualised part. Indeed, it would not be an exaggeration to say that the removal of these blinkers and the concomitant refiguring of the finite/infinite relation in alternative

modellings is a matter of our own survival as well as that of the world in which we find ourselves.

V. Concluding Remarks

Chaosmosis contains the most condensed and worked out statement of Guattari's very particular and complex schizoanalytic cartography. It also operates as itself a machine of sorts: a grasping and gathering of different materials that might be mobilised in the general project of forming an ontology 'beyond' the subject-object split and, leading on from this, of constructing a form of institutional analysis beyond Lacan (hence the many references to other thinkers, the new sciences, and so forth). In particular this philosophical and analytical programme involves the theorisation of chaosmotic entities, an emphasis on asignifying semiotics, and the concomitant mapping out of an aesthetic paradigm for subjectivity in which process, or processuality, is foregrounded. One of the most important aspects of this project is its negotiation of the capitalist regime of transcendent capture. Indeed, it seems to me that Guattari's insights here concerning 'auto-poetic nuclei of subjectivation', or what I call the 'folding-in' of transcendence, suggest a potentially very useful 'up-dating' of Foucault's thesis on the 'care of the self'.

To a certain extent the essays in *Chaosmosis* repeat the same arguments from different perspectives and with different emphases – all of them characterised by a certain polemical urgency and an animating desire for a form of life that is not solely determined by capitalism with its principles of standardisation and homogenisation. Capitalism's reduction of subjectivity and of life in general is countered by a call for a complexification and resingularisation that, rather than closing down on mutation, opens itself up ever further to creativity and invention. This proliferation of models is the second important aspect of Guattari's writings, and in this sense *Chaosmosis* reads like Science Fiction, producing worlds beyond this one and inventing new terms with which to articulate and describe them.

Indeed, *Chaosmosis* offers us a theory of metamodelisation, but also a modelisation itself, one premised on Guattari's very particular ontology. Adjacent to this Science Fiction narrative and conceptual toolbox we are also given – though case studies such as *Le Borde* – ample evidence that any theoretical work must itself be put to work in larger and more diverse realms of heterogenetic encounter. This is the third and arguably most important aspect of Guattari's thesis. Indeed, the paradoxical

nature of Guattari's writings is that while they are often dense and complex, they call for something deceptively simple, namely, that each of us interact with each other and the world in a specifically *different* manner. It is a call to become an active participant in changing our lives as they are at this moment, not to wait for an event that might force us to change. In fact, the nature of the event itself changes: it no longer 'arrives' from an infinite that is barred from the finite, but names the reciprocal inter-penetration of the finite and infinite. This is to figure the world as a complex weave of micro-events – or simply becomings.

In conclusion then, Guattari suggests a continuum of sorts between the finite and the infinite. This fundamentally anti-theological view positions him against a certain post-Kantian tradition of philosophy (and psychoanalysis) that would erect a bar between phenomena and noumena, the real and the symbolic, and so forth. It also, however, places him in a rich alternative tradition, running from the pre-Socratics to Spinoza and from Nietzsche to Bergson, in which subjectivity – or the finite – becomes the means of accessing the infinite as well as its very substance. It is, of course, this very same line of anti-state philosophers that Deleuze claims as his own. No wonder then that when this anti-psychoanalyst and activist, this drawer of diagrams and inventor of concepts, met the contemporary philosopher of immanence, the thinker of absolute difference, they each found in the other not only a fellow traveller but also a stranger, someone who might take them on further adventures of thought. Would it be an overstatement to say that Deleuze and Guattari's collaboration itself diagrammed a new relation of the finite and the infinite? Certainly in works like *Anti-Oedipus* and *A Thousand Plateaus* many strange entities appear, traversing multiple fields, moving at different speeds and often evidencing what Deleuze saw in Spinoza, and what lies at the heart of Guattari's *Chaosmosis*: a certain absolute velocity or infinite speed of thought.

Notes

1. This bar, that effectively stymies access to the infinite, might also be figured as what Quentin Meillassoux has called the 'correlation', or that form of thought – and consequent form of subjectivity – that figures the object as always-already determined by the subject (Meillassoux 2008). Meillassoux's notion of the 'arche fossil' points to a way out of the correlation in that it is an element of the universe that pre-exists man and thus the correlation itself (see Meillassoux 2008: 10). A confrontation between Guattari's theory of the production of subjectivity as a diagram between the finite and the infinite *and* the so-called 'Speculative Realist' philosophers who effectively jettison the subject from ontology is one that I leave for another time, though it is worth noting here

that Guattari's theory of subjectivity is certainly not restricted to the human, and indeed, following the arguments in *Chaosmosis*, might be said to involve any interface between the finite and infinite whether this be human or animal, organic or inorganic.

2. All page number references below are to *Chaosmosis* unless stated otherwise.
3. As Guattari remarks in an earlier interview: 'For Gilles Deleuze and me desire is everything that exists *before* the opposition between subject and object, *before* representation and production. It's everything whereby the world and affects constitute us outside of ourselves, in spite of ourselves. It's everything that overflows from us. That's why we define it as flow [*flux*]' (Guattari 1996a: 205). Guattari is talking here specifically about *Anti-Oedipus* and the refiguring of desire as plenitude (rather than lack) that takes place in that book, but replace desire with chaosmosis and we have a statement about his own solo writings (indeed, perhaps the most notable change in the ten or so years between this interview and *Chaosmosis* is Guattari's reframing of the question of desire and desiring-machines in terms of chaos and complexity). In the interview from which the above is extracted Guattari is interested especially in the repression of this desire – or what he calls micro-fascisms. In the terms of *Chaosmosis* micro-fascisms might be understood a those models of subjectivity that are hierarchised, organised around transcendence – and, crucially, have become petrified.
4. And in 'Machinic Orality and Virtual Ecology', an essay concerned with mapping the resonances between psychosis and creativity, we are given another 'definition' of such practices that might in fact also be part of the aesthetic paradigm:

> Strange contraptions … these machines of virtuality, these blocks of mutant percepts and affects, half-object half-subject, already here in sensation and outside themselves in fields of the possible. They are not usually found at the usual marketplace for subjectivity and maybe even less at that for art; yet they haunt everything concerned with creation, the desire for becoming-other, as well as mental disorder or the passion for power. (92)

5. See especially Deleuze and Guattari 1984: 34–5.
6. This 'effacement of polysemy' might be seen in the standardising individuating mechanisms of web 2.0 that masquerade as interactive and participatory (for example Facebook). Indeed, Guattari is prescient here, as elsewhere, as regards the dangers (as well as hopes) of new media, referring to a language 'rigorously subjected to scriptural machines and their mass media avatars. In its extreme contemporary forms it amounts to an exchange of information tokens calculable as bits and reducible on computers' (104).
7. I attend further to this point in relation to *A Thousand Plateaus* in my article 'Pragmatics for Future Subjectivities (*Probe-heads!* Or how to Live in the Face of Fear)' (O'Sullivan 2006b).
8. Duchamp is the privileged exemplar of the aesthetic paradigm, as evidenced also in Guattari's definition of the readymade (in this case the *Bottlerack*) in the essay 'Ritornellos and Existential Refrains' as a 'trigger for a constellation of referential universes…' (Guattari 1996b: 164). Although Guattari is increasingly seen as providing the theoretical model for expanded practices beyond the object – as in relational aesthetics (see Bourriaud 1998) – we can see in the three Assemblages, or at least in the third, the importance of an object of sorts as an intentional point around which a subjectivity might cohere. This point of self-assertion or autonomy will necessarily involve a break with

typical transcendent schema and signifying regimes, and, as such, art once more points the way: as Guattari remarks in 'On the Production of Subjectivity': '[a] singularity, a rupture of sense, a cut, a fragmentation, the detachment of a semiotic content – in a Dadaist or surrealist manner – can originate nuclei of subjectivation' (18).

9. For Foucault this 'care of the self' involves certain technologies (meditation, friendship, etc.), but especially personal and ethical codes of conduct that determine a freedom of sorts from any transcendent schema that subjects. Foucault writes of this in a number of places, see as indicative example the essay 'Technologies of the Self', and also the interview 'On the Genealogy of Ethics' (Foucault 1994: 223–52 and 253–80, especially page 266). For further thoughts on the connection between Guattari and Foucault, especially in relation to different practices, see my essay 'The Care of the Self and the Production of the New' (O'Sullivan 2008).
10. Deleuze also attends to this folding of the outside, in relation to Foucault's late writings, in the final chapter, 'Foldings, or the Inside of Thought', of his book on *Foucault* (Deleuze 1988a: 94–123). As Deleuze remarks there, in relation to subjectivation: 'It is as if the relations of the outside folded back to create a doubling, allow a relation to oneself to emerge, and constitute an inside which is hollowed out and develops its own unique dimension' (100). This, for Deleuze's Foucault, is specifically to bend external power relations within. Deleuze remarks that this folding – or doubling – might also be understood as memory: '[m]emory is the real name of the relation to oneself. Or the affect on self by self' (107). Indeed, it would seem to me that the folding of the outside in – or the infinite into the finite – precisely constitutes the 'pure past' of Bergson's schema (see the diagram in endnote 15).
11. Is it a coincidence that the third Assemblage (as I have drawn it) resembles the klein bottle used by Lacan as a model of the psyche?:

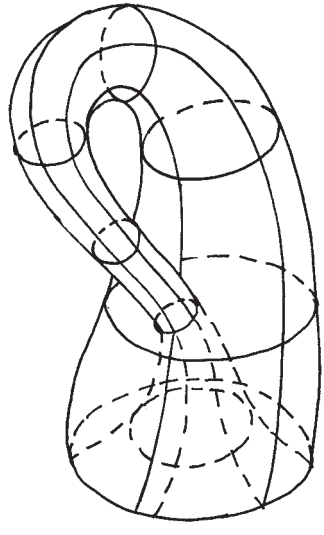


Figure 3. Klein Bottle

This is a model in which transcendence has been 'folded-in' and the subject has thus become a cause of himself or herself (the goal of analysis). Although

there is not the space to develop this here, one might argue that the same 'manoeuvre' – the folding-in of transcendence – is at stake in both Spinoza's Third Kind of Knowledge (no longer being subject *to* a world) and Nietzsche's Eternal Return (the affirmation of which enables a mastery of one's own destiny).

12. The notion of machinic being is developed in the essay 'Machinic Heterogenesis' where the 'entities' are defined as 'abstract machines' that traverse chaos and complexity, giving the different levels of being 'an efficiency, a power of ontological auto-affirmation' (35). In that essay Guattari extends his machinic ontology out to the universe, positing the existence 'of other autopoietic machines at the heart of other bio-mecanospheres scattered throughout the cosmos' (51), whilst at the same time, following the new aesthetic paradigm, foregrounding the importance of 'machines of desire and aesthetic creation' in today's 'assemblages of subjectivation' (54).
13. In 'Machinic Orality and Virtual Ecology' these pre-objectal 'entities' are defined in psycho-, or schizoanalytic terms: 'In the wake of Freud, Kleinian and Lacanian psychoanalysts apprehended, each in their own way, this type of entity in their fields of investigation. They christened it the "part object", the "transitional object", situating it at the junction of a subjectivity and alterity which are themselves partial and transitional' (94). This notion of part objects is itself part of the genesis of Deleuze and Guattari's 'desiring-machines' that further 'rupture with Freudian determinism', situating the latter in more expanded and incorporeal 'fields of virtuality' (95).
14. For a discussion of this form of knowledge, that constitutes a kind of becoming-world, see the section on 'Beatitude' in *Expressionism in Philosophy: Spinoza* (Deleuze 1992: 303–20). In 'Machinic Orality and Virtual Ecology' Guattari would seem to have Spinoza in mind when he describes new practices of orality – such as performance art – as involving 'a search for enunciative nuclei which would institute new cleavages between other insides and other outsides and which would offer a different metabolism of past-future where *eternity will coexist with the present moment* [my italics]' (90).
15. See 'Of the Survival of Images: Memory and Mind' (Bergson 1991: 133–78). Here is the diagram in question:

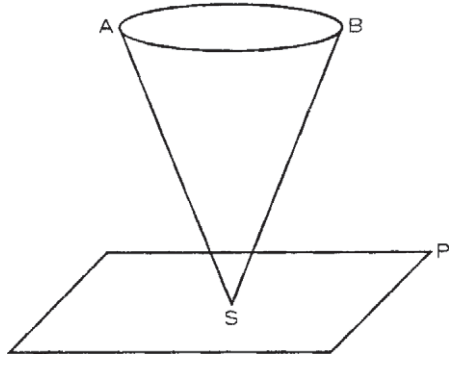

Figure 4. Diagram from Bergson's 'On the Survival of Images', *Matter and Memory*

AB represents the virtual or 'pure past', P the realm of matter ('my actual representation of the universe'), and point S the present being of any

given subjectivity that 'moves forwards unceasingly' (Bergson 1991: 152). By superimposing the above on the diagram of the third Assemblage we get a composite diagram that points towards a double movement of the production of subjectivity: the folding-in of transcendence (movement down from apex) and then the actualisation of the virtual (movement up from inverted apex).

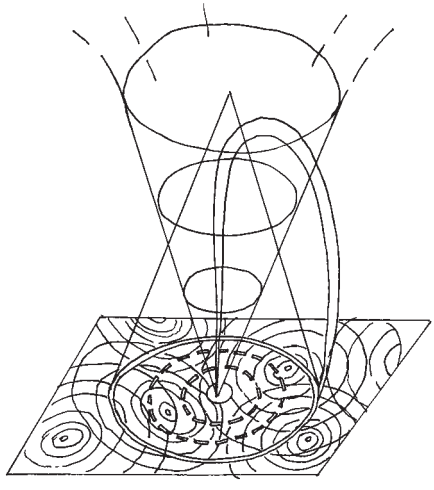

Figure 5. The Double Cone (Bergson-Guattari Composite)

16. See also *What is Philosophy?* where the three great forms of thought – art, philosophy, science – are characterised as *chaoids*: 'compositions' or 'daughters' of chaos (Deleuze and Guattari 1994: 204). In many ways *Chaosmosis* is a supplement to *What is Philosophy?* inasmuch as the latter concerns itself with this relation between chaos and complexity. Franco Berardi develops this connection – between *Chaosmosis* and *What is Philosophy?* – in his recent book *The Soul at Work* where the business of productively and affirmatively negotiating this chaos is defined precisely as the work of the book's title. In fact, Berardi offers a more sobering account of the relation to chaos than explicitly put forward in *Chaosmosis*, thinking the former through also in connection to the increasing old age of our world and the concomitant loss of consistency in its subjectivities. See especially 'The Poisoned Soul' in the latter book (Berardi 2010: 106–83), and, in direct relation to Guattari, the chapter on 'The Happy Depression' in the book on Guattari (Berardi 2008: 9–15). It is worth noting that for Berardi, chaosmosis is not only the ontological ground of our being but also the name for the 'info-sphere' understood as the increasing omnipresence and acceleration of media within our lives (put bluntly, information overload). Berardi's thesis on old age (and depression) is then tied to the concomitant asymmetrical relation between transmitters (machinic technologies) and receivers (biological organisms), a temporal asymmetry that leaves us either too open to the world (schizophrenia), or, in reaction, too closed (depression).
17. Or as Guattari has it in 'Schizo Chaosmosis': '[a]nd chaos is not pure indifferentiation; it possesses a specific ontological texture. It is inhabited by virtual entities and modalities of alterity' (81).
18. In 'On the Production of Subjectivity' these entities are defined as 'existential refrains' to draw attention to this temporal aspect. Here is the paragraph in full

where Guattari articulates the refrain's local temporalisation, or what we might call singular crystallisation of time:

> What we are aiming at with this concept of the refrain aren't just massive affects, but hyper-complex refrains, catalysing the emergence of incorporeal Universes such as those of music or mathematics, and crystallising the most deterritorialised existential Territories. This type of transversalist refrain evades strict spatio-temporal delimitation. With it, time ceases to be exterior in order to become an intensive nucleus [*foyer*] of temporalisation. From this perspective, universal time appears to be no more than a hypothetical projection, a time of generalised equivalence, a 'flattened' capitalistic time; what is important are these partial modules of temporalisation, operating in diverse domains (biological, theological, socio-cultural, machinic, cosmic. . .) and out of which complex refrains constitute highly relative existential synchronies. (16)

19. As Guattari remarks in 'On the Production of Subjectivity': 'An incorporeal universe is not supported by coordinates embedded in the world, but by ordinates, by an intensive ordination coupled for better or worse to these existential territories' (28). These 'incorporeal universes' or virtual ecologies might be productively thought as the content of Bergson's cone (see endnote 15). The 'grasping' here then is the work of an active and creative memory.
20. In the essay 'Schizo Chaosmosis' this 'giving consistency' is figured as 'worlding':

> worlding a complexion of sense always involves taking hold of a massive and immediate ensemble of contextual diversity, a fusion in an undifferentiated, or rather de-differentiated whole. A world is only constituted on the condition of being inhabited by an umbilical point . . . from which a subjective positionality embodies itself. (80)

Again, this 'worlding' takes place 'before space and time, before spatialisation and temporalisation' (81).

21. Deleuze attends similarly to a transmonadic line that produces a new kind of subjectivity in his own solo book post *What is Philosophy?*: *The Fold: Leibniz and the Baroque* (Deleuze 1993). See especially the last few pages where Leibniz's monad, that 'submit[s] to two conditions, one of closure and the other of selection' is prised open 'to the degree that the world is now made up of divergent series (the chaosmos)' (Deleuze 1993: 137). This is the replacement of monadology with 'nomadology', defined as involving 'new ways of folding' (137). Indeed, in general, it seems to me that Deleuze's book parallels Guattari's investigations albeit utilising Leibniz rather than the new sciences in mapping out the possibility of a more processual subjectivity.
22. Guattari ends 'The New Aesthetic Paradigm' with a consideration, and redefinition, of the body as in fact always already a multiplicity of different bodies, different inter-faces, that intersect and that are 'open to the most diverse fields of alterity' (118). Indeed, the body – as it is for Bergson and Spinoza – is the very name of the relation, but also the means of passage, between the actual and virtual (or the finite and infinite). This might be compared with Badiou where the body is the name for that which stymies access to the infinite.
23. In the final essay of *Chaosmosis* this refrain is named the 'ecoscopic object' and the four quadrants become its four dimensions – or strata – of existence. As Guattari remarks: '[w]ithin each of these strata, each of these Becomings and Universes what is put into question is a certain metabolism of the infinite, a threat of transcendence, a politics of immanence' (125).

24. We might usefully compare this particular diagram of the real/possible and actual/virtual with Deleuze's own on the same from *The Fold*:

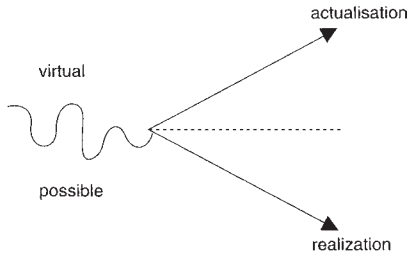

Figure 6. Diagram from Deleuze's 'The Two Floors', *The Fold*

Deleuze's accompanying comments are as follows:

> The world is a virtuality that is actualised in monads or souls, but also a possibility that must be realised in matter or bodies … The process of actualization operates through distribution, while the process of realization operates by resemblance. This raises the especially delicate point. For if the world is taken as a double process – of actualization in monads and of realization in monads – then in what does itself consist? How can we define it as *what* is actualized and realized? We find ourselves before events. (Deleuze 1993: 105)

Although there is not space here to work out the specific resonances (and differences) between Deleuze's and Guattari's two paradigms of subjectivity, it does seem to me that it is also the idea of 'subjectivity as event' (an actualisation *and* a realisation) that is at stake in Guattari's aesthetic paradigm.

25. This latter intention is even more direct in other earlier diagrams, for example this one, taken from Guattari's essay 'The Pace of the Signifier in the Institution':

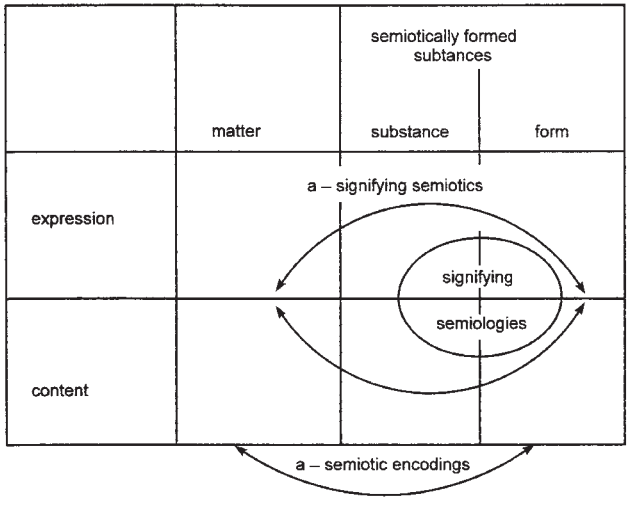

Figure 7. Diagram from Guattari's 'The Place of the Signifier in the Institution', *The Guattari Reader*

As Janell Watson points out, this diagram – or metamodel – 'swallow[s] up Lacan's models of the linguistically-dominated psyche' (Watson n.d.: n.p.). One can see this clearly in the diagram where signifying semiologies are placed in a larger context of asignifying semiotics and the Hjemselvian categories of form, content, substance and matter are used to expand and complexify the dualisms of signification. Watson draws attention to the importance of 'asignifying semiotics' in this framework precisely because they bypass substance and involve form working directly on matter. This then is to avoid signifying regimes altogether (and thus, theoretically, the various capitalist subjectivities produced by them). This asignifying semiotics might also be called the aesthetic paradigm, involved as it is in the production of blocs or entities composed of sensations and intensities.

26. The notion of the 'atmospheric' is important to schizoanalysis. See David Reggio's interview with Jean Oury where the latter links this interest back to Tosquelles' earlier experiments in institutional psychotherapy: 'I've always said, and will continue to say in drawing upon Tosquelles and others, that atmosphere, ambience, is important because today we have the grave ideologies of the pseudo neurosciences which say that atmosphere is not important' (Reggio n.d.: n.p.).
27. See especially the section 'Memories of a Molecule' in Deleuze and Guattari 1988: 272–86.
28. This is in fact to somewhat follow Deleuze and Guattari in *Anti-Oedipus*, where the subject is always in process – a residuum of the consummation between the productivity of the desiring-machines (attraction), and the anti-production of the body without organs (repulsion) – *but also* the product of a retroactive recognition (Deleuze and Guattari 1984: 16–22). As Deleuze and Guattari say, a ' "So it's *me*!" ' (Deleuze and Guattari 1984: 20).
29. *Hupomnemata* were notebooks and other diaries, account books, and so forth that constituted 'a material and a framework for exercises to be carried out frequently: reading, rereading, meditating, conversing with oneself and others' (Foucault 2000: 210). Their purpose, as Foucault remarks, 'is nothing less than the shaping of the self' (Foucault 2000: 211).
30. In passing it is worth noting that we can clearly see this co-existence of signifying and asignifying semiotics within contemporary art practice, in so far as it involves each of the three moments above. For a discussion along these lines see my essay 'From Aesthetics to the Abstract Machine: Deleuze, Guattari, and Contemporary Art Practice' (O'Sullivan 2010).
31. This is mirrored in Jean Oury's own take on the work at *La Borde*: '[w]e work at the level of the poetic, a level infinitely more complex than the logic of computers and neuroscience ... We work at the level of gestures here at *La Borde*. This is within the domain of what is called the "deictic"' (Reggio n.d.: n.p.).
32. Or, in more simple terms:

> For psychoanalysis the unconscious is always *already there*, genetically programmed, structured, and finalized on objects of conformity to social norms. For schizoanalysis it's a question of constructing an unconscious not only with phrases but with all possible semiotic means, and not only with individuals or relations between individuals, but also with groups, with physiological and perceptual systems, with machines, struggles, and arrangements of every nature. (Guattari 1996a: 206)

33. In the earlier interview quoted above Guattari refers to this asignifying semiotics as a semiotics of the body: 'what I call the semiotics of the body, is something specifically repressed by the capitalist-socialist-bureaucratic system. So I would

say that each time the body is emphasised in a situation – by dances, by homosexuals, etc. – something breaks with the dominant semiotics that crush the semiotics of the body' (Guattari 1996a: 205). Such a semiotics will involve what Deleuze and Guattari call a 'becoming-woman' when this involves forms of sexuality and subjectivity that are specifically non-phallocentric and thus closer to the 'situation of desire' (Guattari 1996a: 205; Deleuze and Guattari 1988: 275–7). In passing, it is important to note that asignification does not only work in the direction of the 'liberation of desire', but can also be part of its repression. Gary Genosko alerts us to this important point when he writes, for example, of the 'triggering action' of 'part signs' – 'PINS/passwords', 'the magistripe-reader encoding-decoding relation' that 'do without mental representation' and that allow or block access to information and the like (Genosko 2009: 96–9).

34. As Guattari has it: 'To speak of machines rather than drives, Fluxes rather than libido, existential Territories rather than instances of the self and of transference, incorporeal Universes rather than unconscious complexions and sublimation, chaosmic entities rather than signifiers . . . ' (126).
35. Although Guattari does not address this directly it would seem to me that meta-modelisation will require the development of introspective strategies to break certain modelisations (or simply habits). I have addressed this elsewhere in relation to meditation (O'Sullivan 2008: 99–100). Guattari's attitude is that such breaks happen through group interaction, but, one might ask, how can one really work with collectivity on the molecular and sub-individual without some kind of practice of introspection?
36. Guattari links his thesis of metamodelisation to the practice of 'ecosophy' in the final essay of *Chaosmosis*:

> The ecological crises can be traced to a more general crises of the social, political and existential. The problem involves a revolution of mentalities whereby they cease investing in a certain kind of development, based on productivism that has lost all human finality. Thus the issue returns with insistence: how do we change mentalities, how do we reinvent social practices that would give back to humanity – if it ever had it – a sense of responsibility, and not only for its own survival, but equally for the future of all life on the planet, for animal and vegetable species, likewise for incorporeal species such as music, the arts, cinema, the relation with time, love and compassion for others, the feeling of fusion at the heart of the cosmos. (119–20)

This final essay draws out the political implications of the ontology and ethics, as I have called them above, of Guattari's system – a politics that would be post-human in that it attends to *other* forms of organic and inorganic life. This 'science' of ecosophy might be said to be the extension of schizoanalysis from the institution to the world (see also *The Three Ecologies*). Importantly, once more, the arts and the aesthetic paradigm more generally have a privileged place inasmuch as art can produce the new subjectivities Guattari's ecosophy calls for and gestures towards:

> The artist – and more generally aesthetic perception – detach and deterritorialise a segment of the real in such a way as to make it play the role of partial enunciator. Art confers a function of sense and alterity to a subset of the perceived world. The consequence of this quasi-animistic speech effect of a work of art is that the subjectivity of the artist and the 'consumer' is reshaped . . . The work of art, for those who use it, is an activity of unframing, of rupturing sense, of baroque proliferation or extreme impoverishment, which leads to a recreation and reinvention of the subject itself. (131)

The Secret of Theory

Claire Colebrook Penn State University

Abstract

This article focuses on the concept of the secret in Deleuze and Guattari's philosophy, with specific attention to the related concepts of becoming-woman and literature. It contrasts Deleuze and Guattari's immanent mode of reading with oedipal theories of the text and hermeneutics. Whereas Deleuze and Guattari argue for the positivity of the secret, where there is content that is not disclosed and that therefore creates lines of perception and interpretation, the oedipal mode of reading regards the secret as a (negative) effect of reading.

Keywords: the secret, Literature, becoming-woman

What is the relation between the oedipal trauma and the text, and how might this question negotiate a perceived demise, irrelevance or resistance to theory? We can begin by noting that, today, the remnants of the oedipal frame still operate in the work of Judith Butler, Slavoj Žižek and Joan Copjec, all of whom argue that it is the distance from any 'thing in itself' that produces a maternal beyond and an Other who prohibits our enjoyment of that beyond.[1] It is because we are located within difference, system and language that we imagine some ground beyond system – some Thing – and then fantasise that 'beyond' as Woman. It is our subjection to interpretation and decoding that leads us to posit an ultimate secret or sense from which we are removed, the knowledge of which is held by the Other. Oedipus is not the secret of our being, but the fantasy frame through which we live the absence and impossibility of the secret (Laplanche 1999). All we are given are things, never the Thing, and it is this experience of the fragmented that induces the plenitude from which the fragment is supposedly detached.

Deleuze Studies 4.3 (2010): 287–300

www.eupjournals.com/dls

Self-aware reading or theoretical reading would attend to the ways in which texts, as structures of difference, produce the hidden. Theoretical reading reverses the metalepsis that would posit a sense that is *then* subjected to textuality. Theory is not a decoding of content but an attention to the construction of the very fantasy of content.

To read, then, is to attend to the frame through which the fragment or part object produces, through its very fragmentation, a hidden and unrepresentable plenitude. If theory is a reflection upon how a text is viewed then the oedipal complex is the theoretical endeavour par excellence, the 'theory' of every child who is condemned to read a world whose sense is necessarily hidden. Oedipus, according to Jean Laplanche, is not a theory imposed upon the text in the sense of a code or rubric, such that one might find oedipal structures or desires of authors expressed through the text. For Laplanche, the condition of extrinsic subjectivity – the condition of having to *read* the other whose very being offers itself as enigmatic – generates the oedipal fantasy. Oedipus is not so much the truth of our being as the fantasy frame that restores a centre of truth to an existence that is necessarily decentred. It is not that there is a truth that Oedipus allows us to read; it is the very absence of truth – the non-being of the secret of our existence – that is covered over by the structure of Oedipus. The idea of a sense or truth that we must have repressed is produced in and through the oedipal fantasy. The Copernican turn of Freudian theory occurs with the recognition both of Oedipus as the child's fantasy – that 'our' world is lived from the point of view of a subject who reads a seducing other – *and* with the concomitant idea that this fantasy occurs through the violent intrusion of the signifier. Experience, in its human dimension of dependency, is never centred on itself but always lived through the other, an other whose existence is presented as a secret to be decoded. To know the other's desire, to overcome the limits within which one's relation to the other is mediated, is not only lived by the infant in oedipal form; every adult gaze at the self-contained, complete and blissfully centred world of the infant animates the oedipal fantasy, the fantasy of an original subject whose joy is not yet subjected to the trauma of signification.

Shoshana Felman (1983; 1987), responding to the Lacanian articulation of this relation between signifier/text and the desire to know or interpret the other, brings the oedipal fantasy to the very centre of literary practice. The idea of a sense or presence held by the other (that might be disclosed through interpretation) structures every act of reading. The secret around which the text circles must be imagined in order for any text to be read (as a message), but is also, for all its

necessity, strictly impossible. The subject who gives herself to be read is effected through the distance of the signifier, and is produced *as secret* and *as hidden* only through textual relations. The secret of the text is therefore central to the metaphysics of presence: there must be some original sense that subtends relations. At the same time, the necessary secrecy of sense undoes the fantasy of presence: we are always within relations, always subjected to the enigma of the text; the secret that would be there to be disclosed is effected *as secret* only through its dissimulation.

Despite first appearances, it is the concept of the secret in the work of both Jacques Derrida and Gilles Deleuze and Félix Guattari that, in quite different ways, challenges both the supposedly necessary oedipal frame of the text *and* transforms the status of what it is to read a text theoretically. Theory would go beyond re-living the fantasy of a presence mediated by the other – what Deleuze refers to as the 'neurotic novel' – and would produce a genesis of secrecy. In the case of Deleuze and Guattari certain writers and certain genres liberate the sense of the text from *the secret* by producing points of view that generate an impersonal 'secrecy'. For Derrida it is the 'absolute secret' that takes us beyond the sublime structure of the original secret (which appears to remain in itself before difference) moving towards a radically singular secret which opens each textual frame. There is no secret in general.

Deleuze and Guattari locate their discussion of the secret in their 'plateau', '1730: Becoming-Intense, Becoming-Animal, Becoming-Imperceptible' (Deleuze and Guattari 1987). The threshold date of 1730 is significant,[2] as this section concerns the overcoming of the subject who is set over against a world to be interpreted. The original 'Copernican turn' to the subject occurs with Kant's *Critique of Pure Reason* in 1781, with the thing 'in itself' being regarded as necessarily presupposed but essentially unknowable. This turn to the subject was preceded by fifty years of Leibnizian, Humean, Cartesian and Newtonian theories of the nature of time and space. By locating their memoirs of the secret in this plateau, Deleuze and Guattari indicate that their understanding of secrecy allows for the reversal of a tradition in which thought (and the intuition of time and space) is subjected to signification and mediation. Whereas Kant had precluded theoretical knowledge of things in themselves, Deleuze and Guattari insist that theory is not the recognition of one's distance from sense, but a way of intuiting the life from which sense emerges (Deleuze and Guattari 1987: 255). The secret has a reality productive of, rather than reducible to, textual relations. It may be the case that life gives itself through relations

and perceptions, but there are potentials or singularities that are not exhausted by relations: 'The secret has a privileged but quite variable relation to perception and the imperceptible. The secret relates first of all to certain contents. The content is *too big* for its form' (286).

Deleuze and Guattari begin from an ontology of the secret which is insistently anti-oedipal and is tied to the affirmation and reality of the virtual. It is not that the needs of real material life generate a lack (and subsequent desire) which is then supplemented by the phantasm of the 'thing in itself' or ultimate secret. Rather, life in its full and open virtuality proliferates with a secrecy from which any limited or material reality is contracted. The child, like the animal or like 'molecular perception', perceives worlds that are not reducible to those of signifying 'man'. It is not the case that we exist within signification, with the secret being effected fantasmatically after the event. On the contrary, the secret exists, insists and has a force beyond constituted structures.

This is why for Deleuze and Guattari there is both the secret as content and the secrecy of the perception of the secret – both the perceiving of what is imperceptible (the perception of the child who sees beyond fixed forms and stable identities), and the awareness that there are worlds of others (the perceptions of secret societies). Deleuze and Guattari refuse the modern capitalist oedipal paradigm of *the* subject who, by virtue of the fact that he speaks, is always already caught up in one overarching system (a system whose outside is a dark beyond). There are secrets, they argue, beyond the man of speech and recognition, beyond the subject who feels the limit of his perception as a sublimity that gives him a *sensus communis*:[3] 'There is always a woman, a child, a bird to secretly perceive the secret. There is always a perception finer than yours, a perception of your imperceptible, of what is in your box' (Deleuze and Guattari 1987: 287). Beyond the shared public axiomatic system of the man of reason, whose world is perceived as it would be for all others from the point of view of the subject in general, the perception *that there is a secret* produces other societies, or what Deleuze and Guattari refer to as 'the war machine' – connections of bodies linked through perceptions that are not yet overcoded as being those of 'man in general' (287). 'Man' is the subject whose world is submitted to the 'paranoid machine' where there is a prohibited secret that remains necessarily 'beyond' (289). 'Becoming-woman', becoming-child and becoming-imperceptible are styles of secrecy that wage war on the collective structure. The 'minor' secrets of the child are hysterical rather than paranoid, defined by a singular perception – the secret of this *not yet generalised* haecceity (344).

In addition to transforming the ontology of the secret by arguing that there *is* secrecy – or a power to be perceived that exceeds constituted relations, an imperceptible world that gives itself to be seen – Deleuze and Guattari also offer a specific history of the secret. In modernity 'the secret is made into a structuring organizing form' (Deleuze and Guattari 1987: 289). The childhood hysterias of *secrets* – perception of potentials that are irreducible to the constituted systems of collective speech – give way to a binary structure of sexual difference. There must be a truth or 'beyond' of man in general, *the* secret from which we are all distanced but the enigma of which compels us to enter into an interminable circuit of exchange and debt without exit: 'We go from a content that is well defined, localized, and belongs to the past, to the a priori general form of a nonlocalizable *something* that has happened. We go from the secret defined as a hysterical childhood content to secrecy defined as an eminently paranoid form' (288). As the 'secret is made into a structuring, organizing form', it is woman who takes on the role or position of absent content. It is not surprising that Deleuze and Guattari mention courtly love here, which for the Lacan of Seminar VII heralded the oedipal structure of modernity. It is precisely through *not* being given or attainable that the woman of courtly love withdraws from sense, becoming secret. And this yields what Lacan refers to as an ethics of dependency; it is the absence of the object that precludes my enjoyment, even though the object is produced as the guarantee of *jouissance* only through its obstacles and secretion. Deleuze and Guattari note that this structure of secrecy is constituted through *speed*; the deferral of the object of courtly love produces woman as distant. It is not that a content or secret is then hidden, but that the positive series of displays, rituals and manifestations produces woman, not as one who has a secret, but *as* secret: 'They have no secret because they have become a secret themselves' (289).

If woman as secret – the hidden sense that subtends signifying subjectivity in general – structures modernity, this nevertheless enables a liberation through a traversal of fantasy, or what Deleuze and Guattari refer to as 'deterritorialisation'. If one relates to the secret *not* as man, for whom there is a prohibited content that is the ultimate but absent sense of his being, but as woman for whom there are no secrets because she has *become* nothing more than secrecy, then one moves beyond the binary structure of subject versus world. Secrecy is no longer structured by an interpreting subject who must relate to the enigma of his being; secrecy is diffused, becoming a perception of potentialities to disclose or give *more* than the present: 'This is where the secret reaches its ultimate

state: its content is molecularised, it has become molecular, at the same time as its form has been dismantled, becoming a pure moving line – in the sense in which it can be said a given line is the 'secret' of a painter, or a given rhythmic cell, a given sound molecule (which does not constitute a theme or form) the 'secret' of a musician' (Deleuze and Guattari 1987: 290). In this development of the 'feminine line' there is not a subject who speaks and whose world is therefore necessarily enigmatic, hidden and beyond; there is not *one* structuring relation that grounds all relations. Rather, there is a pre-personal secrecy of singularities. *Life* is just an interacting relay of perceptions, with potentials being actualised only in their relations to other potentials. Against the filiation (or mother-father-child) nexus of the psyche, Deleuze and Guattari oppose the 'epidemic' of the molecule, where relations are not determined in advance by a hidden form:

> We oppose epidemic to filiation, contagion to heredity, peopling by contagion to sexual reproduction, sexual production.... The difference is that contagion, epidemic, involves terms that are entirely heterogeneous: for example, a human being, an animal, and a bacterium, a virus, a molecule, a microorganism. (Deleuze and Guattari 1987: 241–2)

It is not that there are terms that are *then* perceived; terms are created through perceptions. Such networks or 'fibres' nevertheless involve an essential secrecy, precisely because a perception of what is perceived does not exhaust the perceptible; to perceive is to become in relation to what is other, but otherness does not give itself fully in this relation. The secret is becoming-woman not because woman is the negation or absent 'other' of man (*the* secret), but because to perceive the world not as it is for the subject in general but in terms of its singular powers (to be perceived) is positively different from the man of reason. Becoming-woman is at one with Deleuze and Guattari's ontological and political commitment to immanence. There is not a subject in general whose world is mediated through a system – the secret as 'gray eminence' (Deleuze and Guattari 1987: 290). Rather, life is a power of multiple secrets, a proliferating secrecy: a life that gives itself to be perceived while always being more than what is perceived, bearing the potential for further secrecy, 'gray immanence': We move beyond the oedipal structure – the child who perceives, man who is subjected to prohibition, and woman who is the secret prohibited 'thing' – to the possibility of secrecy: not all is given. This shifts us from a binary structure – *a* secret to be read, *a* content through form – to the positive affirmation of an imperceptibility that is created through the proliferation of perceivers:

> What counts in the secret is less its three states (child's content, virile infinite form, pure feminine line) than the becomings attached to them, the becoming-child of the secret, its becoming-feminine, its becoming-molecular – which occur precisely at the point where the secret has lost both its content and its form, where the imperceptible, the clandestine with nothing left to hide, has finally been perceived. From the gray eminence to the gray immanence. (Deleuze and Guattari 1987: 290)

Secrecy or imperceptibility is not *the* hidden. It can become so through the fantasy of the great oedipal secret to which we are structurally enslaved; but it can also yield deterritorialised secret societies, a secret perception of 'a' secret at war with the open secret of 'man'. And such territories of secrecy are possible only because of an absolute deterritorialisation: the life that produces secrecy, the excess or surplus that exceeds both the perceived *and* any sensed secret of the perceived.

Literature is not the form of *the* secret – that there is a sense to be read – but is enabled by a sense of secrecy. The creation of the 'pure feminine line' occurs when sentences no longer pronounce the essence of what is as some predicable quality (x is y), but when multiple perceivers and viewers open the text to worlds not perceived (the free indirect style where 'it is seen that'). Deleuze and Guattari mark a distinction, here, between the novella and the tale, where the latter has a content to be discovered while the former relates to *secrecy*, or the invisible form that orients perceivers and bodies but that is not itself perceived: 'The novella has a fundamental relation to *secrecy* (not with a secret matter or object to be discovered, but with the form of the secret, which remains impenetrable)' (Deleuze and Guattari 1987: 193). In both their plateau on the novella and in the memoirs of the secret Deleuze and Guattari cite Henry James, who was capable in writing of perceiving the positivity of the imperceptible. This is not the James of *The Turn of the Screw* or 'The Figure in the Carpet', where the narrative relations produce the object of hidden sense. (In *The Turn of the Screw* it is the governess's reading of the children's enclosed innocence that produces the suspicion of an impropriety that *must have been* the cause of their corruption; in 'The Figure in the Carpet' it is the literary critic's perception of the author's ultimate secret that produces a similar kernel of absence within the narrative.) Rather, Deleuze and Guattari refer to the James of *What Maisie Knew* and *Daisy Miller*, where the creation of a child's point of view allows for perceptions that are not effected from a drive for interpretation. They are secret in their transparency, not yet submitted to the system of relations among men, not yet signifying a subject for another subject: 'If ever there was a writer who dealt with the secret, it

was Henry James. In this respect he went through an entire evolution, like a perfecting of his art. For he began by looking for the secret in contents, even insignificant, half-opened ones, contents briefly glimpsed. Then he raised the possibility of there being an infinite secrecy that no longer even requires a content and that has conquered the imperceptible' (290).

The singularity of literature is its capacity to produce points of view other than that of signifying man in general. If, for Lacan, all signification is already meta-language, this is because one speaks both with a submission to system and a demand that all one says issues from a constitutive desire for recognition. I am in so far as I speak, and all signification recognises and constitutes me as a subject for the world of signifying subjects. A message always arrives at its sender; a subject is effected *as a subject* only in recognising himself as the recipient of signification. 'I' am just this imperative to answer to this enigmatic signifying other. For Jacques Derrida literature is the undoing of this fantasmatic oedipal closure of the message, and this is because of literature's singular relation to the secret. Language in general *is* history, meaning and sense – the assumption of an ongoing presence that can be recalled through time and re-presented through the word. Literature, by contrast, destroys the temporality that would place the signifier *after* the sense; instead, the text re-inscribes the tracing of this hierarchy. That which remains the same through time – being, presence, meaning – is always effected from a marking out of time, a reduction of the singular to that which can be recalled, shared, rendered present and communicable. If the philosophical logos is the discourse of man in general, where truth appeals to any subject whatever, literature is the discourse of the absolutely singular. In his dispute with Lacan, for example, Derrida argues that Lacan's recognition of the oedipal scene overlooks the 'scene of writing' which produces the points of view, positions and narrative trajectories that cannot be reduced as mere ornaments or figures of an underlying sense (Derrida 1987).

At first glance it might appear that a standard Derridian response to Deleuze and Guattari's ontology of the secret would be critical. Any attempt to intuit, write or think that which is secret and which *then* issues in a perception *of* the secret is always already structured by the system of signification. To hold a secret *to oneself* one would already have to know it and mark is *as secret*; it would already be communicable. To take a concrete example, one can imagine that a secret event that I record in my diary would take on some external form (writing) and could therefore be disclosed or betrayed by someone other than myself.

There could be no pure singularity, for every guarding of the singular as *this* singularity would already subject it to the concept, generality and potential publicity. One might object that just because betrayal is possible this does not allow us to say that it is essential or necessary; but Derrida's key point is that if an event is possible then this must tell us something about the very structure of the secret. If it is possible to betray a secret when it takes on some sort of external form such as writing, then this alerts us to an externality or otherness affecting the most private of secrets. Derrida argues that this otherness or distance from oneself occurs in the most intimate of secrets and auto-affections. In keeping a sense or secret to myself or in order to relate to myself there must be auto-affection where I recognise myself and all my secrets *as mine*. Anything that is kept to oneself as one's own is already never fully or absolutely secret. Consider the most private of memories that are unrecorded, undisclosed and witnessed by no one other than myself. If I am to testify to this absolutely private and secret witnessing – if an event is testifiable – then it is also *essentially* unreliable, distanced from its supposedly pure and punctual origin. If such a secret memory is to exist and be held it must take on some repeatability that distances it from the pure event in its absolute singularity. When such a secret is betrayed, falsified or made public this is possible only because it was already betrayed *in itself*. As false memory syndrome evidences, the *most* private and secret memories are also those which are least securely our own; if such a memory is to become true it must be rendered public, and in so doing lose its absolute authenticity. In order to hold a secret *as secret*, to conceal its archive, evidence and interpretability, one must create an enigma, crypt or code which already opens the secret. A secret is therefore always already *between two*, even if these two are within the supposedly auto-affecting self.

If we were to stop at this point in our reading of Derrida his work would appear to be in accord with a Wittgensteinian rejection of private language; a thought already takes the form of a thought *of* this thing and therefore bears all the features of repeatability and generality that characterise public language. In some ways Derrida's critique of the psychoanalytic paradigm would also reinforce this reading. Lacan, he argues, finds the truth of the oedipal structure in Poe's 'The Purloined Letter'. The physical letter in the story which circulates among characters bears its force not from what it actually says – its repeatable, shared and divisible sense – but from how it mediates relations. The letter, for Lacan, is singular because it is not the bearer of sense, even though it produces a series of relations among characters, all of whom are

'reading' each other. The letter divides and organises the scene, and so *the letter* becomes for Lacan the enigmatic 'thing' that distributes and hierarchises human relations. It is precisely because the minister sees that the letter must be kept secret from the king by the queen, that he has the opportunity to sequester the letter; if the queen were to object to the minister's removal of the letter she would draw attention to the fact *that there is a letter*, and *that there is a secret*. In turn, it is because Dupin sees that the minister himself knows *that there is a secret*, that Dupin also sees that the letter would be placed in the open. (Knowing that the letter will be looked for, the tactic is to place the letter in full view, such that its secrecy or concealment is concealed.) One looks for the truth *as hidden* when, in fact, what is *most secret* is not the message's content but the ways in which the letter that holds the message organises the positions of the characters into the triangle: the queen who looks to see how she is viewed by the king, the minister who sees the queen being governed by the royal gaze, and the minister who sees the ways in which the series of looks will allow the minister to place the letter in the open.

For Derrida, the problem with Lacan's description of the ways in which the hidden letter organises the scene is that Lacan's reading relies on holding the structure of the secret fully in view. The letter *is* divisible according to Derrida precisely because no narrative remains, in itself, capable of being reduced to the truth of the text in general; it allows for a series of readings and framings. There is never *the* letter but only letter-effects, ways in which scenes (such as Poe's story) are opened by inscription. What is missed by Lacan is the 'scene of writing' or the production of the system from which this or that secret is effected.

Like Deleuze and Guattari, Derrida does not accept the oedipal triangle as *the* frame or fantasy of secrecy in general, for the oedipal narrative itself has to be opened from some singular point. For Derrida the *secret* of a text is not a message one might read, nor a message that addresses me precisely through its absence or withdrawal, but an *absolute secret*. Any system, any relation, any naming, *any text*, belies that which demands to be named and thought, but which nevertheless remains separate and non-relational. Here, Derrida aligns himself with the insistence on genesis that motivated Deleuze and Guattari, for the problem of psychoanalysis is its reduction of enigma to a single secret, whereas responsibility demands the thought of how any sense is produced or sequestered *as secret*. At the same time, Derrida's 'ontology' is opposed to Deleuze and Guattari's 'gray immanence'; one can neither name nor intuit the force that produces relations (and this is why Derrida will be critical of the problem of ontology). Whereas Deleuze and

Guattari's singularities are productive of relations, Derrida's 'singularity' is belied by relations. The absolute secret is unnameable, non-relational and *transcendent*. In *The Gift of Death* Derrida gives this name of the unnameable to God, but only in so far as God is thought through a theology that is radically negative:

> The other as absolute other, namely, God, must remain transcendent, hidden, secret, jealous of the love, requests, and commands that he gives and that he asks to be kept secret. Secrecy is essential to the exercise of this absolute responsibility as sacrificial responsibility. (Derrida 1995: 67)

The unfolding or inscription of a scene, including the narrative of oedipal relations with its grounding signifier of presence, relies upon a force that can neither be included, nor read, nor disclosed. While it is true that the condition for testifying to *one's own* secret already relies upon the possibility of betrayal – if the secret is kept to oneself it is already formed as communicable – there is also an absolute secret that is distinct from privacy, ownness and any secret society:

> If I am to share something, to communicate, objectify, thematize, the condition is that there be something non-thematizable, non-objectifiable, non-sharable. And this 'something' is an absolute secret, it is the *ab-solutum* itself in the etymological sense of the term, i.e., that which is cut off from any bond, detached, and which cannot bind itself to anything – this is the absolute, and if there is something absolute it is secret. (Derrida 2001: 57)

In charting the differences between Deleuze and Guattari's and Derrida's approaches to the secret we arrive at one point of convergence, alongside two radically incommensurable divergences. Both insist that the condition for *the* secret, the commitment to presence, meaning or sense that drives the interpretive machine, must emerge from a more radical secrecy. The structure of a subject who reads a world mediated through a lawful system of signification conceals or secretes its genesis. But the secrecy from which relations and structures are effected is explained by competing ontologies and competing claims regarding *life*. Derrida insists both that the absolute secret is death – that which cannot be given and that which does not produce, present and multiply itself – and that the relation to this death *is life*. Life, or the ongoing maintenance of *what is*, requires a marking out of time as the same. Life therefore requires some element that is not itself; the pure auto-affective inner life of consciousness must recognise or affect itself *as* some identifiable being. Singularity or pure life must abandon itself in order to recognise itself. It is this process of marking or maintenance

that remains radically concealed, singular and non-living, never fully one's own: 'Clearly, the most tempting figure for this absolute/secret is death, that which has a relation to death, that which is carried off by death – that which is life itself' (Derrida 2001: 58).

Life is death precisely because 'living on' or living as this individual being who might bear and hold secrets already requires a loss of absolute singularity and a submission to a law of repeatability that can never be one's own. By contrast, for Deleuze and Guattari the secrecy that defines life is that which produces relations and which repeats itself. *Life* is not reducible to the extended and recognisable terms that it produces, but this does not mean that there is an absolute secret so much as a proliferating secrecy, the emission or unfolding of relations the virtual force of which can never be given once and for all. One is not separated from or responsible for this unnameable secret, for precisely through the recognition of virtual life one can overcome subjectivism:

> To be present at the dawn of the world. Such is the link between imperceptibility, indiscernibility, and impersonality – the three virtues. To reduce oneself to an abstract line, a trait, in order to find one's zone of indiscernibility with other traits, and in this way to enter the haecceity and impersonality of the creator. (Deleuze and Guattari 1987: 280)

If Derrida and Deleuze and Guattari are united critically (against the acceptance of any already structured frame of signification), but divided ontologically – Derrida arguing for the radical secrecy of the non-relational, and Deleuze and Guattari arguing for a life of proliferating relations – they are also distinguished *generically* or aesthetically. Deleuze and Guattari explicitly define their secrecy through the genre of the novella, where there is not *a* content to be discovered – *the* secret, *the* sense, *the* genesis of relations – so much as relations where no term is exhausted by or through its perception of any other. There is Maisie as she sees her father, as she is seen by her father, her father as seen by Maisie, her father as seen by his wife as seen by Maisie. What the novella achieves is not a narrative where relations are restored by some denouement that will make sense of the characters' movements, but the production of multiple worlds: relations as seen by Maisie, Maisie's world as seen by her mother, as seen by her father and so on. Literature comes closest to life, to the secrecy of life, in this proliferation of worlds:

> Becoming everybody/everything (*tout le monde*) is to world (*faire monde*), to make a world (*faire un monde*). By process of elimination, one is no longer anything more than an abstract line, or a piece in a puzzle that is itself abstract. It is by conjugating, by continuing with other lines, other pieces, that

> one makes a world that can overlay the first one like a transparency.... It is in this sense that becoming-everybody/everything, making the world a becoming, is to world, to make a world or worlds, in other words, to find one's proximities and zones of indiscernibility. The Cosmos as an abstract machine, and each world as an assemblage effectuating it. (Deleuze and Guattari 1987: 280)

Notes

1. Even a writer as demystifying as Alain Badiou holds on to the Lacanian oedipal structure in his critique of the positing of the infinite: all that can legitimately be posited are finite multiplicities; beyond that there is no One. Any hypostasised infinite is an effect of moving from the finite to a mythically or poetically intimated 'beyond'. The fact that Badiou includes love in his generic truth conditions also testifies to the post-oedipal nature of his work. Just as Copjec (2002) insists, following Lacan, that thinking and ethics would begin only with imagining 'that there is no woman', no beyond of prohibition, so Badiou (1999) defines the truth condition of love through the acceptance of the beloved other as *not* fulfilling some fantasy of plenitude. Judith Butler's relatively recent work still maintains the importance of mourning and melancholia in subject formation, and ties this in turn to political problems of violence and terror (Butler 2009).
2. As Brian Massumi (1992) has noted, in their 'fractal' ontology, Deleuze and Guattari do not subordinate becoming to any end or underlying sense, but there can be certain thresholds where changes in intersecting elements produce a significant change of state space.
3. In his short book on Kant, Deleuze accepts the Kantian separation of the faculties – that reason's ideas of the infinite cannot be intuited – but refuses to assume a pre-given harmony where the feeling of the sublime limit draws one back to a feeling of a transcendental subject's striving for unity (Deleuze 1984: 51–2).

Deleuze's Neo-Leibnizianism, Events and *The Logic of Sense*'s 'Static Ontological Genesis'

Sean Bowden University of Melbourne and La Trobe University

Abstract

In *The Logic of Sense*, Deleuze effectively argues that two types of relation between events govern their 'evental' or 'ideal play', and ultimately underlie determined substances, that is, worldly individuals and persons. Leibniz calls these relations 'compossibility' and 'incompossibility'. Deleuze calls them 'convergence' and 'divergence'. This paper explores how Deleuze appropriates and extends a number of Leibnizian concepts in order to ground the idea that events have ontological priority over substances 'all the way down'.

Keywords: Deleuze, Leibniz, events, ontology, possible worlds, intersubjectivity

Deleuze's philosophical relation to Leibniz has in general been downplayed in the secondary literature.[1] Deleuze's major, pre-*Difference and Repetition* influences are frequently cited as Nietzsche, Bergson and Spinoza, and that these figures are constant touchstones for Deleuze is undeniable.[2] Nevertheless, in his 1968 Spinoza book it is clear that, in certain respects, Deleuze reads Spinoza through Leibniz.[3] It is also clear that Leibniz is a major reference in 'The Method of Dramatization' (Deleuze 2004), which is effectively a summary of the major themes of *Difference and Repetition*. In the text of *The Logic of Sense*, which was published one year after *Difference and Repetition*, Spinoza is not mentioned at all, and Bergson is cited only once. Leibniz, on the other hand, features prominently in the highly

important 'Sixteenth Series of the Static Ontological Genesis', as well as in the 'Twenty-Fourth Series of the Communication of Events', where he is heralded as 'the first important theoretician of the event' (Deleuze 1990a: 171). Similarly, in the much later text, *The Fold: Leibniz and The Baroque*, Leibniz is affirmed as having implemented 'the second great logic of the event', after the Stoics and before Whitehead (Deleuze 1993: 53).[4] It is thus not unlikely that Deleuze sees himself as a philosophical descendent of Leibniz when he maintains in a 1988 interview that 'I've tried in all my books to discover the nature of events' (Deleuze 1995: 141).

This is not to say, however, that Deleuze accepts all of the premises on which Leibniz bases his philosophy. On the contrary, Deleuze's constant criticism is that Leibniz ultimately subordinates the ideal play of events to a principle of converging differences under the hypothesis of a God who calculates and chooses for existence the 'best' or maximally convergent series of possible events. In *The Logic of Sense*, Deleuze suggests that Leibniz's God perhaps responds to a 'theological exigency', or again to an 'economic principle' for the determination of causes and effects, or means and ends (Deleuze 1990a: 59).[5] Nevertheless, according to Deleuze's own testimony in *Difference and Repetition*, this subordination of events to a principle of convergence was Leibniz's 'only error' (Deleuze 1994: 51). In this same work, Deleuze writes that 'no one has gone further than Leibniz in the exploration of sufficient reason . . . [and] the element of difference' (213). Similarly, in *The Logic of Sense*, Deleuze writes that Leibniz went a long way (although not 'all the way') in establishing 'a theory of singular points' and their 'ideal play', that is to say, a theory of the relations of alogical compatibility and incompatibility between predicate-events which would be irreducible to the identical and the contradictory (Deleuze 1990a: 116 and 171).

We would like to show here how, in the *The Logic of Sense*'s 'Sixteenth Series of the Static Ontological Genesis', Deleuze turns to Leibniz in order to ground the idea that events have ontological priority over substances 'all the way down'. Following Leibniz, but also criticising and extending several of his presuppositions and concepts, Deleuze effectively argues that two types of relation between events govern their 'evental' or 'ideal play', and ultimately underlie the determination of substances, that is, of substantial 'things' such as individuals and persons. Leibniz calls these relations 'compossibility' and 'incompossibility'.[6] Deleuze, for his part, calls them 'convergence' and 'divergence' (Deleuze 1990a: 111). Before examining the ways in which Deleuze takes up Leibniz's philosophy, it will be important to briefly

recall a number of elements of Leibniz's thought and to highlight the role of compossibility and incompossibility therein.

I. Leibniz's System in Outline

For Leibniz, before the creation of the world, God has an understanding of all of the 'possibles', that is, of all possible individual concepts. What is possible, at this level, is anything whose concept does not violate the 'principle of contradiction' (Leibniz 1973a: §31 and §43; 1989b: 19). In other words, in so far as the concept of an individual does not in itself involve a contradiction, it is possible in the minimal sense that there is no inherent reason why it cannot be thought: it is, as Leibniz writes, 'perfectly conceivable' (Leibniz 1969a: 662; 1966: 54).

Not all of these possibles, however, can be thought *together* without contradiction, for what is possible in itself is not necessarily '*com*possible' with other such possibles.[7] In God's understanding, then, possibles which are compossible with one another in various ways form 'an infinite number of possible worlds' (Leibniz 1973a: §53). Or again, the possible world of any given individual concept is the totality of all individual concepts compossible with it (Rescher 1967: 17). Possibles which are 'incompossible' with one another, correspondingly, belong to different possible worlds.

From among all of these possible worlds, God will bring only one into existence: the 'best' of all possible worlds, that is, the one which is maximally compossible, displaying the most perfection, which is to say, the most variety and order with respect to the series of individual concepts (Leibniz 1973a: §58; 1973b: §10). This act of creation follows from the very nature of God, whose concept includes the primary perfections: power, wisdom, goodness and, of course, existence (Leibniz 1989a: §1). In other words, given that he is a necessary and all perfect being, to not bring into existence the best of all possible worlds would contradict the very nature of God.[8]

The existing world, our actual world, is thus composed of utterly unique individual substances, or 'monads', which 'realise' the maximally compossible series of possible individual concepts.[9] Being compossible with the entire series of existing monads, then, each individual monad is said to 'express' or 'mirror' the entire universe of monads (Leibniz 1973a: §56), one thing 'expressing' another 'when there is a constant and regular relation between what can be said [that is, predicated] about one and about the other' (Leibniz 1969c: 339). It is due to this relation of compossibility or expression that each monad carries 'traces

of everything that happens in the universe'. In short, for Leibniz, each existing monad or 'singular substance expresses the whole universe in its own way, and . . . all its events, together with all their circumstances and the whole sequence of external things, are included in its notion' (Leibniz 1989a: §§8–9).[10]

Leibniz's monads are simple, unified, extensionless and imperishable substances. They are the 'true atoms of nature', but there are no causal relations between them (Leibniz 1973a: §§1–7). They rather have, as has been seen, expressive relations of predication. In other words, what 'we call causes are only concurrent requisites' whose agreement or 'harmony' has been regulated by God from all eternity (Leibniz 1989d: 33). Nevertheless, in this non-causal relation of expression, a monad is said to be '*active* insofar as what is distinctly known in it [i.e., in its concept] explains what occurs in another, and *passive* insofar as the reason for what occurs in it is found in what is distinctly known in another' (Leibniz 1973a: §52).

Being imperishable and extensionless 'points of view' on the universe, monads are, for Leibniz, necessarily souls or minds (a mind being a 'reasonable' soul) (Leibniz 1989h: 79; 1989d: 34). But it is also clear from what has been said above that there are souls and minds 'in the least part of matter' (Leibniz 1973a: §66). Even in the case of 'rational souls' such as ourselves – that is, souls endowed with memory, reason and capable of acts of reflection – our so-called 'bodies' are in fact teeming with 'bare monads' or 'sensitive souls' having between them particularly well coordinated and direct relations of expression (Leibniz 1973a: §§28–30 and §82).

Furthermore, as simple, extensionless and thinking substances, monads or souls are internally characterised by their perceptions and appetitions. Perception is defined as a 'passing state, which involves and represents a plurality within the unity or simple substance', and appetition as 'the passage from one perception to another' (Leibniz 1973a: §§14–15). It is important to note that this characterisation of monads is perfectly compatible with the idea that monads are distinguished by the way in which they realise, in their own particular way, the maximally compossible series of possible individual concepts conceived of by God, for God himself is a monad, having as his attributes the primary perfections. In other words, what God perfectly and all at once perceives, the created monads perceive only imperfectly, in related, though varying and changing, degrees of clarity, confusion and distinctness depending on their 'point of view' on the universe. Indeed, Leibniz argues that each monad perceives the entire universe,

but confusedly for the most part, in minute, unconscious perceptions (Leibniz 1973b: §13). What the monad perceives or represents distinctly, on the other hand, are those monads 'nearest' to them and which compose its 'body'. The soul thus 'represents the whole universe also in representing the body which belongs to it in a particular way' (Leibniz 1973a: §62).

Every body, then, has a 'dominant' monad which is 'active' in the sense examined above: its concept expresses more distinctly what happens in and for the monads composing its body. The 'dominated' monads, for their part, express this dominant monad confusedly or passively, but they in turn are dominant or active in relation to other monads, clearly and distinctly expressing what happens in relation to them, and so on, to infinity (Leibniz 1973a: §70; 1973b: §4). 'Body', in this sense, is thus 'not a substance, but a phenomenon resulting from simple substances', the 'reality of which is situated in the harmony of the perceivers with themselves (at different times) and with other perceivers' (Leibniz 1989i: 181; 1989j: 181).

Monads, then, are simple, unified or 'closed', imperishable substances which have non-causal, expressive relations between one another, and which fall under complete individual concepts which express the entire universe from a particular point of view. If monads are simple or 'closed', however, what is the status of relations between them? It is clear that compossibility and incompossibility are relations, but these relations only govern the formation of worlds, the best of which is subsequently realised by simple, closed substances which alone exist. The relations between existing individuals must, therefore, be 'out of the subjects; but being neither a substance nor an accident, it must be a mere ideal thing' (Leibniz 1989f: 339). Nevertheless, relations are said to be well founded in so far as they '*inhere in the nonrelational properties of the relata at issue*' which, as has been seen, are determined by relations of compossibility and incompossibility (Rescher 1979: 56).

Another important consequence of monadic 'closure' and the 'completeness' of its concept is that the infinite number of predicates which define each monad's unique point of view on the universe are, as Leibniz says, analytically 'contained' or 'included' in its concept (Leibniz 1989a: §8 and §13). It does not follow from these notions of analyticity and inclusion, however, that the opposite of a true proposition denoting an existing monad implies a logical contradiction strictly speaking. For, as seen above, such a proposition about existing monads is always possible or perfectly conceivable in so far as it does not in itself involve a contradiction. The opposite of a true proposition denoting an existing

monad is not contradictory in itself, but rather incompossible with the compossible set of true propositions characterising the world of created monads.

Truths of 'fact' are thus of a different nature than truths of reason, even if both are 'analytic'. Indeed, for Leibniz, if the principle of contradiction governs truths of reason or necessary truths (formal possibilities or essences), then the 'principle of sufficient reason' governs contingent truths or truths of fact (Leibniz 1973a: §§31–6). Leibniz formulates the principle of sufficient reason in the following way: 'nothing happens without its being possible for one who has enough knowledge of things to give a reason sufficient to determine why it is thus and not otherwise' (Leibniz 1973b: §7). What this means is that, following our exposition above, the sufficient reason why something is true of a given simple substance must be able to be seen in an analysis of the way in which something is true of another monad whose concept is apt to explain the worldly nature of the former. Furthermore, since a sufficient reason must also be found for this latter monad's being such and such, this analysis must be continued into that of the 'concurrent requisites' of a third monad, and so on, right across the infinite series of created things, and finally into an analysis of the concept of a God who, in line with his perfections, grants existence to that series of monads which realises the maximally compossible series of possible individual concepts which he conceives in his understanding. God, in the final analysis, is thus the sufficient reason for the entire series of created things (see on this Leibniz 1973a: §§36–8).

For Leibniz, therefore, all 'true predication has some basis in the nature of things', up to and including the nature of that thing called God (Leibniz 1989a: §8). And the difference between these truths of fact and truths of reason is that the latter can be analysed in a finite number of steps while an analysis of the former requires an infinite number of steps. Of course, no created monad can carry out an infinite analysis. God, however, sees the entire series 'at the same time' or knows it 'intuitively' (Leibniz 1989k: 99; 1989l: 25). This is still not to say, however, that at the end of even an infinite analysis, true propositions of fact could be reduced to simple, primitive terms. For if they were so reducible, the world would have to have been created according to an absolute, logical or metaphysical necessity, thereby contradicting the concept of God who, in his perfect power, wisdom and goodness, must be free to choose and bring into existence the best of all possible worlds (Leibniz 1989a: §13; 1973c: 49). Since God must nevertheless be said to be the sufficient reason for the series of created things and their expressive relations,

rather than arguing that contingent truths can be reduced to identical propositions, we must say that the infinite analysis of contingent truths is 'asymptotic' to certain necessary truths: those concerning God's essential attributes, the relation between which is established by the ontological proof of his existence (Leibniz 1966: 77).[11]

Now, our argument here is that it is in accordance with the problem of finding a coherent means of speaking about the ontological primacy of events in relation to substances that Deleuze turns to Leibniz. Having explicated the major lines of Leibniz's philosophical system, let us now examine what Deleuze takes from it.

II. Deleuze and Leibniz: The 'Static Genesis' of Individuals and Persons and the Pure 'Play' of Events

As noted in the introduction, central to Deleuze's philosophy of the event in the 'Sixteenth Series' of *The Logic of Sense* is a certain appropriation of the Leibnizian relations of compossibility and incompossibility between predicate-events, in so far as these are understood to ontologically precede and govern the constitution of worldly individuals and persons.

It should be remarked, however, as a point of terminological clarification, that when Deleuze speaks of compossibility and incompossibility between events, he does so, more often than not, by speaking of them in terms of the convergence and divergence of 'singularities' (Deleuze 1990a: 172). It is thus not uncommon for Deleuze to write of 'singularities-events' (103, 112, 116). While we cannot here deal with the complex reasons why Deleuze speaks of events and their relations by means of these quasi-mathematical concepts,[12] what is important to understand is that singularities-events and their relations of convergence and divergence have several characteristics which map quite precisely onto those of their correlates in the Leibnizian system: predicate-events and their relations of compossibility and incompossibility.

The first of these characteristics is that singularities-events are 'impersonal and pre-individual'. For Deleuze, in other words, just as for Leibniz, events and their relations precede the constitution of individuals and persons. As Deleuze argues, relations between events form 'worlds', and the 'individual is inseparable from a world' (Deleuze 1990a: 109).

Secondly, as Deleuze describes it, singularities-events may be either convergent or divergent, or as Leibniz would say, compossible or incompossible. Deleuze explicitly ties together the notions of compossibility and convergence when he writes that 'compossibility is … defined as a

continuum of singularities, whereby continuity has the convergence of series as its ideational criterion' (Deleuze 1990a: 111). It should here be noted that Deleuze speaks of the convergence of 'series' rather than of singularities-events *per se*, for, as he writes, the 'nature' of a singularity is determined in so far as it is 'analytically prolonged over a *series of ordinary points* up to the vicinity of another singularity' (109; emphasis added and translation modified). So what is the correlate in Leibniz's system of Deleuze's differentiation between the singular and the ordinary?

It was said above that, for Leibniz, within a possible world, a given individual substance is said to be active or dominant with respect to another in so far as what its concept *distinctly* expresses explains what occurs in relation to this other. And this latter substance is, correspondingly, passive or dominated in relation to the former: its concept expresses what happens only *obscurely*.[13] But, distinctly or otherwise, what are known in individuals are precisely the predicate-events which define their relations to other individuals within a world, over time.[14] For Leibniz, therefore, within a world of compossible individuals, there are both distinct events and obscure events. Now, Leibniz's 'distinct and obscure' events map quite precisely onto Deleuze's 'singular and ordinary' events. Indeed, when Deleuze says that singular events are 'analytically prolonged' over ordinary events, this must be understood in terms of the Leibnizian principle of sufficient reason which governs truths of fact in relation to worldly individuals. Thus: the sufficient reason why a first, obscure or ordinary event can be truly predicated of a given simple substance must be able to be seen in an analysis of the way in which a second, distinct or singular event can be truly predicated of another monad, and in such a way that the concept of this latter is apt to explain why the first event is included in the concept of the former. And of course, for Leibniz as well as Deleuze, the reason why this second event can be truly predicated of this second simple substance must be able to be seen in an analysis of the way in which a third event can be truly predicted of a third simple substance, and so on, *ad infinitum*.

The third point of correspondence between the Leibnizian and Deleuzian systems is thus that, in so far as singularities-events are analytically prolonged over series of ordinary events, and in so far as these series converge with series which depend on other singularities-events, a possible world is formed. Conversely, therefore, another world, incompossible with the first, would begin 'in the neighbourhood' of those singularities-events whose series diverge (Deleuze 1990a: 109, 111).

Now (and this is our fourth point), within such a compossible world, 'individuals are constituted which select and envelop a finite number of the singularities of the system. They combine them with the singularities that their own body incarnates . . . [and] spread them out over their own ordinary lines' (Deleuze 1990a: 109). For Deleuze, therefore, just as for Leibniz, the individual 'parts' of an individual's body are related in precisely the same way as individuals in general, that is, through the way in which the events which define them can be analytically prolonged over one another within a compossible world. As Deleuze writes, Leibniz 'was right to say that the individual expresses a world according to the relation of other bodies with its own, as much as it expresses this relation according to the relation of the parts of its own body' (110).

In accordance with the Leibnizian system, Deleuze now argues that, to the extent that existing individuals are said to envelop singularities-events which have been 'analytically prolonged' over ordinary events within a possible world, these convergent events must be said to have become, within this world, 'the analytic predicates of constituted subjects' (Deleuze 1990a: 112). This, then, is a fifth point of correspondence: singularities-events are effectively 'realised' or 'actualised' as the predicates or 'concurrent requisites' of existing individuals. The analyticity of the individual's predicates follows from the idea that the individual simply is its realisation of a particular, determined slice of the continuum of singular and ordinary events which have been analytically prolonged over one another within a compossible world. Each 'expressing' the entire world-series in a unique way, each determined individual thus expresses every other, but in 'variable and complementary degrees of clarity' depending on the particular slice of the continuum of singularities-events they have been said to actualise (111). Viewed together severally, therefore, 'their bodies form mixtures and aggregates, variable associations with zones of clarity and obscurity'. What is more, it follows from the analytic nature of the continuum of singularities-events that we can consider the 'relations' between bodies as the analytic predicates of the mixtures they form (112).

Deleuze concludes this section of his analysis and appropriation of various Leibnizian concepts by writing that he 'identifies', following Leibniz, 'the domain of intuitions as immediate representations, the analytic predicates of existence, and the *descriptions* of mixtures or aggregates' (Deleuze 1990a: 113). And we have seen what these 'identifications' amount to: the domain of intuitions refers to the 'harmoniousness' of the world-series of convergent singularities-events (which is to say, for Leibniz, God's intuitive knowledge thereof); the analytic

predicates of existence are the determinations in relation to which individuals 'actualise' particular 'slices' of this world-series; and the description of mixtures or aggregates refers to the way in which relations of coexistence and succession between individuals and their bodies can be understood as a function of the analytic predicates of existence. What will also be essential to retain from the above is that Deleuze follows Leibniz in arguing that the continuum of singularities-events must be distinguished from the individuals who envelop or express only a certain number of these singularities-events. In other words, while the expressed world 'does not exist outside of the monads which express it', the world cannot be identified with the way in which it exists in the monads, for the world is defined, prior to the constitution of worldly individuals, as the convergence of singularities as they extend themselves over series of ordinary points (110–11). As Deleuze writes, while the world exists in the individual as a predicate, it 'subsists in an entirely different manner, as an event or a verb, in the singularities which preside over the constitution of individuals' (111). We have spoken of the predicates which determine individual things as such (e.g., Adam is a sinner, Christ is a redeemer), but these predicates are themselves determined in relation to convergent series of pre-individual events (to sin, to redeem, etc.) which are only subsequently realised in determined, existing individuals (Adam, Christ, etc.).

The next question Deleuze addresses in the 'Sixteenth Series', still following Leibniz in certain respects, is how the individual can 'transcend' the world of compossible singularities-events in which it is determined in order to 'confront' this world and constitute itself as a 'knowing subject' in relation to objects of experience, as well as in relation to other such knowing subjects. Indeed, for Deleuze, the problem of understanding how events are ontologically primitive in relation to 'things' is prolonged in this problem of knowledge. In fact, there is in Deleuze's reading of Leibniz, as there is throughout *The Logic of Sense*, a fertile relation between these ontological and epistemological problems. We might even say that Deleuze's ontology of events in *The Logic of Sense* is a transcendental ontology, in the sense that the 'world' of events, which has ontological priority over worldly individuals, is not something external to the conditions of knowledge. As will be seen, for Deleuze the world is an event which results from another, prior event, which is a synthesis of divergent worlds or divergent points of view in an intersubjective and linguistic context.

Now, we do not say that one individual knows another simply because they ontologically 'express' one another within a compossible world. We

would not say, for example, that a rock knows the hammer which breaks it apart, simply because of a law-like or expressive relation between their 'concurrent requisites'. Rather, when we speak of knowledge, we speak of an individual's knowledge that x, where x has propositional content which may be exhibited in language in an intersubjective context. In other words, knowledge necessarily implies a relation between 'persons', and a relation between these persons and the world, which transcends their relations within a compossible world. Indeed, this is precisely why Deleuze, in the first instance, emphasises relations between *incompossible* worlds for the determination of knowing subjects and the 'things' they know. As he writes:

> the Ego as knowing subject appears when something is *identified* inside worlds which are nevertheless incompossible, and across series which are nevertheless divergent... It is only when something is identified between divergent series or between incompossible worlds that an object $= x$ appears transcending individuated worlds, and the Ego which thinks it transcends worldly individuals, giving thereby to the world a new value in view of the new value of the subject which is being established. (Deleuze 1990a: 113; translation modified)

As examined above, a world is said to be incompossible with another when series of ordinary events, which depend upon a given singularity-event (analytic prolongation), diverge with series depending on another. Now, for Leibniz, since the created world is characterised by the universal convergence of series of events, such divergences must be only apparent: a by-product of the fact that no existing individual, save God, can carry out an infinite analysis of the convergent world-series of events. Indeed, Leibniz often tells us that various 'evils' – that is, events such as Christ's dying, Judas' betraying Christ, or Sextus Tarquin's raping of Lucretia – can appear to us to diverge from a world created by an omnipotent, omniscient and perfectly benevolent God.[15] This divergence, however, is only apparent, for it is based on our inability to appreciate that everything is of the highest perfection there can be, either because we lack God's vision of the convergent world-series, or because we cannot perform the calculations necessary to see that a world devoid of a given evil would be a comparatively less perfect world.[16] For Leibniz, in short, because divinely conceived worlds are defined by the convergence of series of events, the relation between incompossible worlds is ultimately one of *exclusion*: either this world or another world, but not both (Deleuze 1990a: 172).

For Deleuze, however, taking up some of Leibniz's texts in a very non-Leibnizian way, we can establish a *positive* relation between incompossible worlds in terms of a problem which refers to certain 'conditions' which constitute it as a problem (Deleuze 1990a: 113). As Deleuze writes, a 'problem . . . has conditions which necessarily include 'ambiguous signs', or aleatory points, that is, diverse distributions of singularities to which different cases of solution correspond' (114; translation modified). In spelling out the nature of these 'ambiguous signs', Deleuze's main references are Leibniz's *Theodicy*, one of Leibniz's letters to Arnauld, and a much earlier mathematical text, 'On the Method of Universality'. In relation to this latter work, Deleuze examines the way in which, in relation to conic sections, Leibniz attempts to find the 'formula, rule, equation or construction' for which the equations of the various curves (circle, ellipse, hyperbola, parabola, straight line) are only particular cases (see Leibniz 1961: 115–17).[17] What is crucial is that this 'universal equation' has 'ambiguous signs' or 'characters' which allow for the 'inclusion' of the different cases of conic sections. These ambiguous characters are here of two forms: a *sign*, which may be either an addition, subtraction, or a series of such operations; and a *letter*, which may be a finite, an infinitely large, or an infinitely small line or number. These characters, which are ambiguous or indeterminate in the general formula, may then be 'filled in' by unambiguous signs, thereby generating the finite number of cases corresponding to the cases of conic sections. In other words, the universal equation unifies and exhibits, within an objective 'problem', the relations among the series of apparently discontinuous cases of conic sections. As Emily Grosholz concludes, 'this equation, by exhibiting the conic sections as limit cases of one general equation . . . displays their mutual relations as a coherent system' (Grosholz 2007: 212). Or again, as Deleuze puts it:

> the equation of conic sections expresses one and the same Event that its ambiguous sign subdivides into diverse events – circle, ellipse, hyperbola, parabola, straight line. These diverse events form so many cases corresponding to the problem and determining the genesis of the solutions. We must therefore understand that incompossible worlds, despite their incompossibility, have something in common – something objectively in common – which represents the ambiguous sign of the genetic element in relation to which several worlds appear as cases of solution for one and the same problem. (Deleuze 1990a: 114; translation modified)

Now, although Leibniz did not explicitly treat such 'ambiguous signs' with respect to the relation between possible existences belonging to

incompossible worlds, Deleuze finds several indications of such an operator in Leibniz's works. In particular, Deleuze understands the figure of Adam in one of the letters to Arnauld, as well as the figure of Sextus in the *Theodicy*, to be examples of such ambiguous signs. In other words, these figures are considered to be 'objectively indeterminate' operators within an inter-worldly 'problem' which is 'resolved' by the way in which these operators take on particular, determinate values within the incompossible worlds forming the cases of solution to the problem. Thus, in his letter to Arnauld of July 14, 1686, Leibniz responds to Arnauld's criticism that 'it is no more possible to conceive of several possible Adams, if Adam be taken as a singular nature, than it is to conceive of several "myselves" ', by writing that:

> when I speak of several [possible] Adams, I do not take Adam for a determined individual but for some person conceived in a relation of generality (*sub ratione generalitatis*), under circumstances which seem to us to determine Adam to be an individual but which do not truly do so sufficiently; as for instance, when we mean by Adam the first man, whom God puts in a pleasure garden, which he leaves through sin, and from whose side God makes a woman. But all this does not sufficiently determine him, and so there might be several other disjunctively possible Adams . . . But that concept which determines a certain Adam must include, absolutely, all his predicates, and it is this complete concept which determines the relation of generality in such a way as to reach an individual (*rationem generalitatis ad individuum*). (Leibniz 1969b: 335)

As Deleuze extrapolates:

> Within these [incompossible] worlds, there is, for example, an objectively indeterminate Adam, that is, an Adam positively defined *solely* through a few singularities which can be combined and can complement each other in a very different fashion in different worlds (to be the first man, to live in a garden, to give birth to a woman from himself, etc.). The incompossible worlds [thus] become the variants of the same story. (Deleuze 1990a: 114)

However, as Deleuze notes, in the letter to Arnauld such a 'vague Adam has no existence; he exists only in connection with our finite understanding, and his predicates are only generalities' (Deleuze 1990a: 346, n.4). In other words, Leibniz's primary aim here is to make a distinction between how finite individuals can conceive of a 'vague Adam' (i.e., in relation to a few predicates of a general nature), and how God conceives of the complete individual concept of the existing

Adam, with his infinite number of determinate predicates. Deleuze, however, is more interested in defining the 'ambiguous sign' common to incompossible worlds without passing through the distinction between God and his finite creatures. He thus turns to the figure of Sextus in Leibniz's *Theodicy* (see Leibniz 1951: §§413–17).

At the end of this text, Leibniz presents us with a story of the historical figure, Sextus Tarquin. Sextus goes one day to find the God, Jupiter, whom he beseeches to change his fate. Jupiter replies that were he to renounce the then kingdom of Rome, he would be given other destinies. Sextus, however, not being able to reconcile himself to the sacrifice of the crown, leaves Jupiter's temple in a rage and abandons himself to his destiny such as we know it: to the rape of Lucretia which will bring about the collapse of the kingdom of Rome. Theodorus, the high priest, who has been watching this scene, asks Jupiter why he has not given Sextus another will. The God replies that Theodorus should go and see his daughter Pallas, who will show him what he, Jupiter, was obliged to do in order to create the world. Theodorus then finds himself transported with the goddess to the palace of destinies, where he sees representations not only of the real world but of all other possible worlds. What he sees in effect is a series of apartments organised in the form of a pyramid. In each apartment there is a possible world filled with all of the individuals of that world including, each time, a different Sextus: a Sextus happy but mediocre in Corinth, a Sextus king of Thrace, and so on. As Theodorus climbs the pyramid, these worlds with their various Sextuses become more and more beautiful, indeed, they become 'better', until finally at the summit he sees a representation of the real world, the most perfect of all, where Sextus leaves the temple, goes to Rome, rapes Lucretia, brings about the downfall of the kingdom, and so on.

For Leibniz, of course, these pages function as a kind of counterfactual proof of the goodness of God, designed to show why God could not *not* have chosen for existence the Sextus whom we know, along with his evil deeds. For it is in comparing all of the possible worlds and their different Sextuses that we come to realise that the existence of the historical Sextus is an integral condition of the best of all possible worlds.[18] Deleuze's interpretation of these passages, however, is that Leibniz is inviting us to consider the pyramid with its incompossible worlds as a 'problem' which is susceptible to various orders or states. Within this problem, then, Sextus functions as an 'ambiguous sign', common to all the incompossible worlds making up the pyramid, in so far as these different worlds 'appear' depending on the different ways in which he is determined. As Deleuze writes, we

> are no longer faced with an individuated world constituted by means of already fixed singularities, organized into convergent series, nor are we faced with determined individuals which express this world. We are now faced with the aleatory point of singular points, with the ambiguous sign of singularities, or rather with that which represents this sign, and which holds good for many of these worlds, or, in the last analysis, for all worlds, despite their divergences and the individuals which inhabit them. (Deleuze 1990a: 114)

There is thus, following Deleuze's reading of Leibniz, a Sextus = x – or, more generally, an 'object = x' (Deleuze 1990a: 114–15) – which is common to a number of incompossible worlds, and which forms part of the objective conditions of the 'problem' defining the positive or non-exclusionary relation between these worlds. These objects = x are thus no longer thought of as individuals determined in relation to an analytic continuum of singularities-events within a single compossible world, but rather as 'ambiguous signs' which express a non-exclusionary relation between worlds perceived as incompossible.

Now, this shift from the determined individual to the object = x also signals the necessity to rethink the nature of the predicates which would define such objects. As Deleuze explains, in relation to objects = x, predicates are no longer the analytic predicates of individuals determined within a world and carrying out the description of these individuals. They are rather predicates which define objects = x synthetically, and open different worlds and individualities to them as so many variables or possibilities. In other words, instead of each world being the analytic predicate of individuals described in series, it is rather the incompossible worlds which are the synthetic predicates of objects = x, in so far as these latter must be defined in relation to what Deleuze calls a 'disjunctive synthesis' of these incompossible worlds (Deleuze 1990a: 115).

How then do these considerations respond to the problem of knowledge such as this was characterised above? First of all, in so far as it forms part of the conditions of the problematic relation between perceived incompossibilities, it is clear that the object = x transcends any particular individuated world. Furthermore, the individual which 'thinks', 'identifies', or synthetically defines this object = x in relation to these incompossible worlds, must itself transcend worldly individuals. Finally, at precisely the same instant that the individual gives to the world a 'new value' through the synthetic determination ('identification') of an object = x in relation to variables belonging to incompossible worlds, it must itself be given a new value within this newly synthesised world. For, if individuals are always relationally determined within a

world in the way examined above (analytic continuum), then a world which is being supplemented with new values must entail corresponding new definitions for all of its related individuals. In other words, the individual which has become a 'knowing subject' must also be said to be synthetically defined, within a 'new' world, by the kind of 'incompossible predicates' to which the object = x has exposed it.

This is not, however, the end of the story. Deleuze proceeds to argue that all objects = x are 'persons'. As he writes: 'There is thus a "vague Adam", that is, a vagabond, a nomad, an Adam = x common to several worlds, just as there is a Sextus = x or a Fang = x. In the end, there is something = x common to all worlds. All objects = x are "persons" and are [synthetically] defined by predicates' (Deleuze 1990a: 114–15).

The reason why objects = x are 'persons' must be approached from two points of view. First of all, Deleuze writes that we are not so much concerned with the ambiguous sign *per se*, as with what *represents* this sign (Deleuze 1990a: 114), and that which represents this sign could only be a person or an 'I'. Indeed, following Deleuze's analysis of the propositional dimension of 'personal manifestation' earlier in *The Logic of Sense*, in the order of speech 'it is the I which begins, and begins absolutely ... the I is primary, not only in relation to all possible denotations which are founded upon it, but also in relation to the significations which it envelops' (15). In this sense, then, persons correspond with what Leibniz calls 'minds' or 'spirits', that is, rational and conscious monads capable of thinking, willing and conversing among themselves. They not only perceive or represent the world relatively clearly and have memory, they are also capable of inference and reflexive self-consciousness and may approach God's intuitive understanding of the world of which they are a part, though only with respect to a limited portion of it.[19] Limited in this way, of course, as argued above, a person's particular perception of the world of which they are a part may diverge from the perceptions of other persons. But for Deleuze, it appears, it will be by positing an object = x open to different possible worlds that the person will be able to formulate the 'problem' corresponding to the positive, non-exclusionary relation between these worlds, and then resolve that problem by representing that object = x in a particular way.

On the other hand, however, Deleuze writes that objects = x simply *are* persons. So what could it mean to say that a person synthesises incompossible worlds by representing an object = x, if this object = x is itself a person? In short, and although Leibniz never puts it in quite this way, it appears that Deleuze wants to argue that there is at work

here what Donald Davidson calls a process of 'triangulation', whereby knowledge of the world cannot be separated from knowledge of oneself (that is, of the contents of one's beliefs) as well as knowledge of other persons or minds.

Now, 'triangulation' in Davidson's work is designed to respond to the problem of correlating a concept with some unknown object, but without presupposing the concept as already given. As he writes:

> It takes [at least] two points of view to give a location to the cause of a thought [i.e., a perception], and thus to define its content. We may think of it as a form of triangulation: each of two people is reacting differentially to sensory stimuli streaming in from a certain direction. Projecting the incoming lines outward, the common cause is at their intersection. If the two people now note each other's reactions (in the case of language, verbal reactions), each can correlate these observed reactions with his or her stimuli from the world. A common cause has been determined. The triangle which gives content to thought and speech is complete. But it takes two to triangulate. (Davidson 2001: 212–13)

So how can this concept of triangulation be translated back into the Deleuzian-Leibnizian vocabulary we have here been employing? It is by arguing that the reason why objects = x are to be understood as persons is that the 'unknowns' which condition the positive relation between incompossible worlds refer to a problematic relation between persons or knowing subjects. In other words, the knowing subject does not *directly* represent some unknown thing (object = x) which defines a problematic but non-exclusionary relation between incompossible worlds. Rather, the knowing subject stands in a problematic relation to another such subject in an intersubjective and linguistic context: inter-worldly problems are inter-personal problems. It thus follows that both subjects' mutual 'identification' of one another (that is, of their behaviour, the meaning of their verbal activity, the contents of their beliefs, their behaviour *vis-à-vis* further persons, and so on) is a necessary condition for resolving a problematic but positive or non-exclusionary relation between different ways in which the world can be perceived. The problem of the relation between incompossible worlds will thus be resolved to the extent that a three-fold and simultaneous determination takes place: that of the beliefs of a knowing subject, that of the beliefs of another knowing subject, and that of a common world of individuals corresponding to these beliefs. And this three-fold determination conforms quite precisely to Deleuze's resolution of the problem of knowledge, such as this was cited above: when something is identified between divergent series or between incompossible worlds,

an object = x or person appears transcending individuated worlds, and the person which thinks it itself transcends worldly individuals, thereby giving to the world a new value in view of the new value of the subject which is being established. And as was also examined above, for Deleuze, these persons are defined by predicates: no longer the analytic predicates of individuals determined within a world which carry out the description of these individuals, but predicates which define persons synthetically in relation to disjunctive syntheses of incompossible worlds, opening these divergent worlds and their corresponding individuals to them as so many variables or possibilities.

Of course, in Leibniz, there is a 'person' who is common to all possible worlds: God. As Deleuze writes:

> As far as the absolutely common object in general is concerned, with respect to which all worlds are variables, its predicates are the first possibles [*premiers possibles*] or the categories... The universal Ego is, precisely, the person corresponding to something = x common to all worlds, just as the other egos are the persons corresponding to a particular thing = x common to several worlds. (Deleuze 1990a: 115; translation modified)

Now, it should first of all be noted that the 'first possibles', in this citation, refer to the 'irreducible concepts' or 'absolute attributes of God'.[20] As has been seen, for Leibniz, it is because God is ontologically determined by his absolute attributes or perfections that he brings into existence a unique, maximally compossible world of singularities-events: the best of all possible worlds. Indeed, it is for this precise reason that any incompossibilities perceived by the individual substances belonging to the created world are merely apparent. Yet, if we also take into account the Leibnizian idea that whatever the created monads perceive has always-already been included by God in their concepts, it can be said that God, as an 'ontologically' determined object = x, is absolutely common to all perceptions of apparently incompossible worlds. Conversely, if finite, created individuals were able to show that perceived incompossibilities such as various 'evil' events are in fact integral parts of the same, maximally compossible world – the best of all possible worlds – then these individuals would have effectively proved that God, in choosing this world for existence, evils and all, is all wise, all powerful, all good, etc.[21] Leibniz's God, therefore, can be thought of in this sense as a 'person', determined in a triangular structure along with other persons and worldly individuals.

Nevertheless, it is also clear that Leibniz's 'ontological proof' for the nature and existence of God requires no recourse to such triangulation,

relying as it does only on the principle of contradiction.[22] Crucially, then, Leibniz ultimately determines the 'ideal play' of singularities-events with reference to an underlying substance: God. In other words, individuals and persons, for Leibniz, are not determined by singularities-events 'all the way down'. Rather, the events which determine individuals and persons are themselves to be determined with reference to God.

How, then, must the Leibnizian system be modified such that it can be said that events, considered only from the point of view of their ideal play, govern the genesis of worldly things? In short, following Deleuze, two requirements must be met: divergences must be 'affirmed' *as* divergences, and the persons who are 'common' to these divergences must always be considered as 'produced forms', brought about only by the play of converging and diverging events (Deleuze 1990a: 113, 116, 172). Indeed, these two requirements are interrelated, for if persons are always derived from the play of events, there can be no original point of view from which it can be said that divergent worlds are reducible to the same world which is in principle identifiable. And conversely, if incompossible worlds are affirmed as incompossible, then persons, unable finally to resolve divergences, remain forever 'open' to further (re-)determinations within the above analysed structure of 'triangulation'.

With regard to the first requirement of affirming divergences, Deleuze writes that 'Leibniz did not attain the free character of this play [of singularities-events], since he neither wanted nor knew how to breathe enough chance into it, or to make of divergence an object of affirmation as such' (Deleuze 1990a: 113–14). What, then, does it mean to affirm divergences? Deleuze expands upon this idea in the 'Twenty-Fourth Series of the Communication of Events', immediately after his heralding of Leibniz as the 'first' (though obviously not the last) 'important theoretician of the event' (171). Here, Deleuze argues that to affirm divergences means that different 'things' must be affirmed through difference rather than through identity. In other words, instead of a 'form of identity' determining things in their differences, it must be difference itself which relates things together in so far as they are different (172–3). What this implies is that, instead of a certain number of predicates being excluded from a thing in so far as this would contradict the form of identity guaranteed by the existence of God (maximally compossible world), each 'thing' must be open to the infinity of predicates through which it passes (174). Or to put it another way, as Deleuze does somewhat poetically, we must speak of the communication of series of singularities-events, no longer with reference to a world (cosmos), but

within a 'chaosmos' (chaos-cosmos) (174). What then causes events to communicate within this 'affirmative synthetic disjunction' is 'the erection of a paradoxical instance... which traverses the divergent series as divergent and causes them to resonate' (174). But in fact, we have shown that this paradoxical instance is nothing other than an object = x or 'person' common to incompossible worlds. It now follows that if we are to affirm divergences as such, no person can be thought to be reducible to an already given instance, identical with itself. This is what Deleuze means when he writes that, in affirming divergences, 'the ideational centre of convergence [i.e., the 'person = x'] is by nature perpetually decentred, it serves only to affirm divergence' (174–5).

This leads us to our second point: that of understanding this paradoxical instance – this person – as always produced and never as originary. Indeed, Deleuze writes that, in 'truth, the person is Ulysses, no one [*elle n'est personne*] properly speaking, but a produced form, derived from this impersonal transcendental field' (Deleuze 1990a: 116). Deleuze is here playing on the French homonym *personne*, which may be either a noun meaning 'person' or pronoun signifying 'nobody'. But there is also a deeper, philosophical transformation at stake. Indeed, we have seen how the person is determined or identified as such (with respect to their beliefs, behaviours, etc.) within a triangular structure involving another person and an object of experience, and such that each 'point' of the triangle must be determined only in relation to the other two. Within such a structure, therefore, there is no unproduced 'point of view': every point of view could only be a 'result' of triangulation. If, however, there are no unproduced points of view, then there is no guarantee that perceived divergences could be reduced to a convergence, from which it also follows that persons remain 'open' to further determinations. In this sense, the person is never an underlying substance but is itself an event, produced entirely by syntheses of singularities-events within processes of triangulation. Deleuze confirms this productive relation of triangulation in the 'Twenty-Fifth Series of Univocity' when he writes that it is

> necessary for the individual to grasp himself as an event; and that he also grasp the event actualized within him as another individual grafted onto him. In this case, he would not understand, want, or represent this event without also understanding and wanting all other events as individuals, and without representing all other individuals as events... [T]he individual, born of what comes to pass, affirm[s] his distance [i.e., difference] with respect to every other event. As the individual affirms the distance, he follows and joins it, passing through all the other individuals implied by the other events, and

> extracts from it a unique Event which is once again himself. (Deleuze 1990a: 178; translation modified)[23]

Or again, more poetically, in the 'Twenty-Fourth Series of the Communication of Events':

> Leibniz . . . subjected the points of view to exclusive rules such that each opened itself onto the others only insofar as they converged: the points of view on the same town . . . [O]n the contrary, the point of view is opened onto a divergence which it affirms: another town corresponds to each point of view, each point of view is another town, the towns are linked only by their distance and resonate only through the divergence of their series, their houses and their streets. There is always another town within the town . . . [D]ivergence is no longer a principle of exclusion, and disjunction no longer a means of separation. Incompossibility is now a means of communication. (Deleuze 1990a: 173–4)

But now a final question arises: if, for Deleuze, persons are always produced – if, in other words, there is no uncreated creator – what brings about the convergence of singularities-events which determine worldly individuals in the first place? Deleuze does not address this point directly, even though he continues to maintain that '[i]ndividuals are infinite analytic propositions' even after affirming that the person is 'nobody' (Deleuze 1990a: 118). So how must the individual and its analytic predicates of existence now be understood, in the absence of God's divine ordering of them? It appears that Deleuze wants to argue, relatively uncontroversially, that the individual concepts which make up a determined world must, quite simply, be consistent with one another. In other words, if something is an individual in a given world, its concept must be consistent with those of the other individuals in that world. Indeed, this is only another way of saying that the world in question, if it is to be a world, must be law-like. Therefore, in so far as it is necessary for the definition of worldly individuals as such, the notion of consistency – or rather, of convergence – will be an integral part of the Deleuzian system. Thus, even if worldly consistency is no longer grounded in a divine act as it is for Leibniz, this convergence will still be understood as the 'analytic prolongation' of singular events over series of ordinary events, up to the neighbourhood of another singularity-event; and this convergence of series of events will still be ontologically prior to the way in which determined worldly individuals will be said to 'express' this continuum or world-series in their variably distinct and obscure 'concurrent requisites'.

Now, if consistency or convergence is a necessary requirement for the determination of a world and the individuals which express it in law-like ways, how must we understand the further idea, examined above, that individuals are ultimately determined by relations between persons who are common to divergent worlds? First of all, it has been said that divergent worlds appear as a consequence of the fact that persons are, like any worldly thing, 'finite with respect to their clear expression', that is, with respect to the 'corporeal zone of expression' or perceptual apparatus in terms of which they express their relations with the world (Deleuze 1990a: 118). And again, that knowing subjects are 'finite' in this way is a relatively uncontroversial claim. Nevertheless, as has also been seen, persons transcend their immediate worldly determinations in so far as they bring about syntheses of divergent worlds within a triangular structure simultaneously implicating other persons and a world of determined individuals corresponding to the beliefs of these persons. As Deleuze puts it, persons are grounded on individuals and, conversely, individuals are grounded by the person (118). With respect to these syntheses, then, the person as a knowing subject will be said to have been synthetically defined in relation to the divergent worlds. On the other hand, in accordance with the requirement noted above, the world of individuals synthesised out of the incompossible worlds will still be said to have resulted from a continuum of converging singularities-events; but now, this convergence must be considered to have been generated by the same synthesis of incompossible worlds which defined the knowing subject. In other words, even though convergence is a necessary relation with respect to determined worlds and worldly individuals, this must here be seen to be generated by prior divergences and their 'disjunctive syntheses' in relation to persons. So it is in this sense that, as was said earlier, the law-like 'world' of events – which has priority over determined, worldly individuals – is not something external to the conditions of knowledge. The world and, by consequence, its individuals and persons, are rather constituted, as events, by these conditions. In other words, Deleuze's ontology of events, whereby events are ontologically prior to substances 'all the way down', is a transcendental ontology.

III. Conclusion

We have thus seen how Deleuze initially follows Leibniz in arguing that the determination of individuals and persons – or 'monads' in the Leibnizian vocabulary – presupposes relations of convergence and

divergence between singularities-events. But we have also seen how Leibniz was not able to reach the point of affirming the ontological priority of events over substances 'all the way down', since, for this latter, relations between events are ultimately determined with reference to an already given, divine substance. Leibniz, let us recall, only made a negative use of divergence, in so far as his God brings into existence a single, maximally compossible world, and excludes from existence anything incompossible with this world. Deleuze, however, extending certain Leibnizian concepts such as the 'ambiguous sign', argues that divergence must rather be affirmed as such. This affirmation of divergence effectively consists of the erection of a paradoxical instance – the object = x or person understood as 'nobody' – which causes divergent series of events to communicate through their differences. Within a virtual 'triangular' structure implicating an open series of such *personnes*, as well as a chaos-cosmos of incompossible worlds, disjunctive syntheses are carried out which will generate the determined individuals and determined persons populating the actual world. The world is thus an event, which is to say that disjunctive syntheses or processes of triangulation are the 'evental-determinations' of the events characterising worldly individuals and persons in general.

The aim of this present study, however, has not only been to clarify Deleuze's understanding of the ontologically primitive event such as this is outlined in *The Logic of Sense*'s 'Sixteenth Series of the Static Ontological Genesis'. It has also been to bring into focus the importance of Leibniz for Deleuze as a philosophical source. As noted above, the relation between these two philosophers has been addressed only sparingly in the secondary literature. It is thus hoped that we have been able to contribute in some small way to rectifying this neglect.[24]

Notes

1. There are only a few works devoted to Deleuze's philosophical relation to Leibniz, and all of these concern Deleuze's 1988 work, *The Fold*. See: Badiou 1989, Frémont 1991, Baker 1995, During 2003, Robinson 2003, and McDonnell and van Tuinen 2010. Rölli (2009) shows the way in which Deleuze draws on Leibniz in order to develop a 'transcendental psychology of perception'. In relation to Deleuze's work more generally, Smith (2007) indicates a number of points of intersection between Deleuze and Leibniz. Williams (2003 and 2008) has also highlighted Leibniz's influence on Deleuze in his major early works, *Difference and Repetition* and *The Logic of Sense*.
2. See, for example, May 2005 and Hardt 1993.
3. See, for example, Deleuze 1990b: 11: 'What interested me most in Spinoza wasn't his Substance, but the composition of finite modes. I consider this one of the most original aspects of my book. That is: the hope of making substance

turn on finite modes, or at least of seeing in substance a *plane of immanence* in which finite modes operate, already appears in this book. What I needed was both (1) the expressive character of particular individuals, and (2) an immanence of being. Leibniz, in a way, goes still further than Spinoza on the first point. But on the second, Spinoza stands alone. One finds it only in him. This is why I consider myself a Spinozist, rather than a Leibnizian, although I owe a lot to Leibniz.'

4. Although Deleuze here seems to revise his argument from *The Logic of Sense* that Leibniz was the *first* important theoretician of the event, it should be noted that the above citation from *The Logic of Sense* occurs immediately after Deleuze's critique of the Stoics in this text, which shows how they tried but ultimately *failed* to think the 'ideal play of events'.
5. On the 'principle of economy', see also Frémont 1991: n.10.
6. On the concepts of 'compossibility' and 'incompossibility', see Leibniz 1969a: 661–662; and 1996: III, vi, §12. This concept of compossibility is fundamental to all of Leibniz's most important works, even if it is not always mentioned by name. See, for example, Leibniz 1973a: §56; 1973b: §10; 1989a: §9 and §14; and 1951: §201.
7. See Leibniz 1948: 325: 'The compossible is that which, with another, does not imply a contradiction' (cited in Mates 1986: 75, n.36).
8. Leibniz's argument that the existence of God necessarily follows from his concept is a recasting of the 'Ontological Argument' in relation to the principle of contradiction. In short, Leibniz supplements the argument that if God is a being having all perfections, and if existence is a perfection, then God exists by definition, by showing that the idea of a being having all conceivable perfections is not contradictory. God is thus a necessary, existing being and this can be known *a priori* or by reason alone. See Leibniz 1973a: §41 and §45; and 1989c: 237–8.
9. On Leibniz's 'principle of the identity of indiscernibles', which accounts for the uniqueness of the monads, see: Leibniz 1989a: §9; and 1989d: 32. See also Leibniz 1989e: 328: 'To suppose two things indiscernible is to suppose the same thing under two names.'
10. Another way of putting this is to say that each monad has a 'complete individual concept' which is capable of distinguishing it from every other such monad, and in which God is able to read, from a particular 'point of view', not only everything that happens to it, but also everything that happens in the entire universe. See Leibniz 1989a: §8 and §14.
11. On the 'ontological proof' of God's existence, see note 8, above.
12. See on this Duffy 2010: 89–111.
13. 'Distinctly' here means: more economically, more simply, with greater explanatory force relative to a differentiated system of concepts, and so on. Thus, to take one of Leibniz's examples (see Leibniz 1973d: 63–4), we cannot explain the motion of the ship in terms of it being caused by its wake, for, given the connection between our concepts of these individuals (which are themselves bound up with our more general concepts of water, displacement, ships, wind propulsion, and so on), this would lead us to having a very confused or indeed obscure representation of what is going on. On these terms, see also Leibniz 1989l.
14. See Leibniz 1989g: 70: the 'notion of an individual includes considered as possible what, in fact, is true, that is, considerations related to the existence of things and to time'.
15. See, for example, Leibniz 1989a: §3; 1951: §§414–16.
16. See particularly on this Leibniz 1989m: 153–4.

17. See also on this Bouquiaux 2006: 34–5, and Duffy 2010: 89–111.
18. See also on this, Frémont 2003: 79–103, and Bowden 2006: 108–9.
19. See on this: Leibniz 1973a: §29 and §§83–4; 1973b: §5 and §§14–15; and 1989a: §§34–6.
20. Leibniz uses these terms as synonyms in 'Meditations on Knowledge, Truth, and Ideas' (Leibniz 1989l). The 'categories' mentioned in this citation, on the other hand, refer to the *a priori* concepts which define the 'unity of apperception' in Kant, in so far as these allow diverse appearances to be brought together in a law-like manner for the knowing subject. However, we shall not here deal with Deleuze's critique of Kant, except to say that Kant treats the knowing subject as an origin rather than as a produced form in accordance with the ontological priority of events over substances (see Deleuze 1990a: 97–8, 105).
21. See, on this, Frémont's work on Leibniz's *Theodicy* (2003: 86). She argues that the story of Sextus Tarquin is designed to illustrate how we must understand – that is, by comparing, for example, the effects which ensue from differently determined Sextuses – how historical evils are not divergences from, but rather the conditions of, the best of all possible worlds. It follows from such a 'juridical proof' that God must be all good, all wise, all powerful, etc. See also on this Bowden 2006: 110–11.
22. See note 8, above.
23. It is clear from the context here that for 'individual', in this citation, we should read either 'person' or 'individual or person', but only in so far as, by 'person', we understand 'nobody': a 'produced form'. The idea of grasping the event being actualised within me as another individual or person *grafted* onto me is no doubt a means of recalling this passage from the 'Sixteenth Series': 'In truth, the person is Ulysses, no one [*elle n'est personne*] properly speaking, but a produced form … And the individual is always anyone [i.e., any individual, *quelconque*], born, *like Eve from Adam's rib*, from a singularity prolonged [*prolongée*] over a line of ordinary points and starts from the pre-individual transcendental field' (Deleuze 1990a: 116; emphasis added and translation modified).
24. I would like to thank Paul Patton, Simon Duffy and an anonymous reviewer for their helpful comments on an earlier version of this article.

Critical Forces: True Critique or Mere Criticism of Deleuze contra Hegel?

Kane X. Faucher The University of Western Ontario, London

Abstract

The principal concern of this paper is to track the first wave of criticism directed against Deleuze's relation to Hegelianism as it has appeared in the English-speaking world. To this end, we assess the criticisms offered by Stephen Houlgate, Judith Butler, and Catherine Malabou, each of whom, in their respective ways, accuse Deleuze of misreading Hegel, claiming that his rejection of Hegelianism merely reinforces a secret or unacknowledged Hegelianism inherent in his own critique. Despite the brisk treatment Houlgate grants Deleuze, his charges are by far the most serious, and hence it is to these that much of the discussion is dedicated; but the aim is to show how each of these claims concerning Deleuze's misreading of Hegel themselves involve a misreading of Deleuze.

Keywords: Stephen Houlgate, Catherine Malabou, Judith Butler, Hegelianism, Nietzsche criticism, desire, difference

Several commentators are of the opinion that the entire Deleuze–Hegel debate has become stale, and that therefore committed Deleuzians, rather than becoming bogged down in such fruitless disputes, ought to be taking Deleuze's positive philosophical gains seriously, and set about freely creating concepts.[1] Although we certainly acknowledge the importance of this innovative feature of Deleuzianism, as well as the

fact that the Deleuze–Hegel debate is more than two decades old, it still behooves us to return to and rearticulate the central issues at stake. In the spirit of Nietzsche, we must clear the stage in an act of active nihilism before we can be free to create concepts. This is not to say, of course, that the debate will or should rage on endlessly. Rather that, as less focus is placed on the objections Hegelians and Deleuzians have towards one another, the more we may become free to trace out precisely what significance and use Deleuzianism has for us.

I. Stephen Houlgate

Although there are many notable critics of Deleuze's Hegel interpretation, we have here selected the most salient and, in our opinion, most meticulous critic who seems to best encapsulate the charges levelled against Deleuze. Houlgate's key criticism is that Deleuze performs an aberrant misreading or distortion of Hegelian themes; he asserts that Deleuze violently attacks the finery of the Hegelian system while at the same time implying that he struggles in a theoretical quicksand and only sinks faster the more he struggles. In response, the approach here will be to examine these criticisms in an orderly fashion and then attempt to respond with the assistance of strong textual support from Deleuze's principal works. Of equal importance, however, is that this operation be performed delicately without prematurely dismissing or sacrificing Hegel in order to further the Deleuzian cause. There are many commentators and critics on either side of this debate, and our plan is to trace a fair path between them in order to revive an argument that may have been lost in the heat of polemic and complicity.

Four years after Hugh Tomlinson's translation of Deleuze's *Nietzsche and Philosophy* brought Deleuze into the English-speaking world, there would be a stir among Hegelian scholars about the relevance of Deleuze's critique. In response to the question of how to critically assess this critique of Hegel, Stephen Houlgate, in *Hegel, Nietzsche and the Criticism of Metaphysics* (1986), devotes a significant portion of his first chapter to responding to the popularisation of Deleuze's reading of Nietzsche as a critique of Hegelianism. Houlgate levels three key interrelating criticisms against Deleuze's understanding of Hegel, all of which amount to the claim that Deleuze's interpretation involves a 'distortion' (Houlgate 1986: 5). These key objections are as follows: 1) Deleuze implies that the entire operation of the dialectic is based upon an initial external negation of specific differences between things. 2) Deleuze's aversion to oppositional structures is not consistent in so far

as his version of affirmation is essentially opposed to Hegelian negation. 3) Deleuze's fully self-affirmative Being, because it is not negatively determined, can have little value for us. The first criticism is in direct response to the Deleuzian claim that Hegel's Being relies on negation and so is therefore not internally different nor is conceptual difference a true concept of difference. The second and third criticisms are in response to the Deleuzian claim that Hegel's labour of the concept does not provide new ways of thinking.

According to Houlgate's reading, Deleuze's understanding of Hegel's dialectic in *Nietzsche and Philosophy* is in error in so far as it implies that the entire operation of the dialectic is based upon an initial external negation of specific differences between things (Houlgate 1986: 5). Houlgate highlights Hegel's strategy, which also indicates why Deleuze's understanding of the Hegelian dialectic is incorrect: 'a thing must be *in itself* the negation of something else' (7). That is, dialectical negation does not begin outside the object, but is already inherent in the object from the very beginning. The reality or specific concreteness of an object depends on negative determination, and the Hegelian dialectic goes to great lengths to demonstrate that any form of affirmative determination (or non-determination) would be an impossibility.

For Hegel, negative determination must be necessary and not merely sufficient so that objects can possess quality, for an object without quality has no real existence (or is yet to be determined, determination being the role of consciousness). Without negation, there is no determinateness, no quality, and so no real object (Hegel 1969: 123–5). If Deleuze wants to do away with negative determination in his ontology, how then can his objects be qualified and be made real? Negation is a moment of the reality of the object that results in its affirmation, and by no means the only reality of that object. However, without negative determination, without contradiction in the object, objects cannot have qualities. For example, redness on its own without relation to other colours is mere undetermined abstraction, and so depends on what it is not (green, blue, yellow, etc.) in order that its quality can be realised as a positive content. But the negation that results in determining redness from another colour does not, contrary to Deleuze's interpretation, begin by merely negating the specific external difference of another colour found outside the initial colour. Rather, there is already something inherent to redness that is negatively determined, just as there is in all the other colours; as such, it is their immanent relation by negativity that mutually determines them. In the quality of redness there is already the idea of not-red serving as a moment in the positive constitution of

this redness. Inherent in this same redness there is both redness and not-redness; the specificity or qualified difference of red and not-red is determined in its relation with an actual other thing (such as green) that also possesses the quality of not-red in its constitutive content qua greenness as an idea. The not-redness as the negative quality of red, when put in relation with the not-redness of green, is in this instance green. Therefore, the positive result of this negatively determining relation is the affirmation of both red and green. The difference of red and green must be in thought, not outside it, for it is thought that determines differences between *and in* things.

Houlgate claims that Deleuze's understanding of negation is too limited, and that this limitation may be the very source of Deleuze's distortion of Hegel. According to Houlgate, Deleuze views negation as 'always either a denial of already qualitatively specified forces, or the secondary consequence of the self-affirmation of already qualitatively specified force' (Houlgate 1986: 7). Therefore, Houlgate points out, what is lacking in Deleuze's interpretation is negation conceived as that which differentiates forces. According to Houlgate, Deleuze does not recognise the truly immanent character of negation in the determination of affirmative being, and so Deleuze's view of dialectical negation is little more than a caricature of Hegel's dialectical negation. By reassigning the negative as a mere after-effect of already qualified forces (leaving us to ponder just how these qualified forces were specified or determined in the first place), we are left with no qualitative identity between affirmative and negative modes of being, but rather return to the rhapsody of empty empirical 'thises' – or, to how every being begins with merely affirming and positing itself as full and determined in its content without relation to anything else. Without this relation of negativity, there is no way to qualify being.

These qualitatively specified forces of active and reactive are, for Deleuze, irreducible to conceptual differentiation, and hence in Hegelian terms these forces would lack sufficient determination (Houlgate 1986: 7). Without this determination acting as a proper foundation, these forces would not only remain undifferentiated, but would not even have any reality. And so, if these forces in their already pre-differentiated quality are said to express being fully, then Deleuze is committed to reject a notion of the Other that would otherwise be necessary to determine selfhood, for this Other would be superfluous to the determination of being that is already affirmatively self-determined: 'The only true sense of selfhood for Deleuze is that of the affirmative, active mode of being, which affirms its own specific qualities "immediately"

and does not conceive of itself as inherently mediated by negation, as *intrinsically* the negation of the other' (8).

Houlgate's second objection is that Deleuze's aversion to oppositional structures is not consistent in so far as his version of affirmation is essentially opposed to Hegelian negation. Although Deleuze criticises the dialectical operation for creating oppositions as fictional concepts for what it takes to be real phenomena, Deleuze himself applies this very structure in his own assertion of affirmative being in so far as he 'determines affirmation as essentially *opposed* to negation (in the sense of the negative will to power)' (Houlgate 1986: 8). Negation forms a moment in the will to power, in opposition to the affirmative mode of the will to power. However, despite this oppositional structure in the will to power between negative and affirmative modes, Deleuze is not willing to admit that negation is an inherent and necessary component of affirmation. Instead, the negative is a distinct component *outside* of the affirmative power, or as a secondary by-product of affirmation itself.

If Deleuze fails to recognise the immanent character of negation in the determination of being, says Houlgate, the consequences of following this line of reasoning will be unsavoury. If Being begins as affirmative without any immanent negation inherent to its determination, how can any qualitative difference exist between beings? Houlgate demonstrates this difficulty in reconsidering the master–slave dialectic. If the master is a completely affirmative being without a moment of negation in his determination as an affirmative being, then he can have no shared human identity with the slave, and so there can be no mediation between the two: the master continues to exploit the slave unabated, and the slave continues to be servile consciousness (Houlgate 1986: 8). There can be no movement beyond this typology because there is no negation or mediation in this relationship unless the master has some inherent negativity as a moment in his affirmative constitution as being. Therefore, no equality between master and slave can be the result of their relationship. Houlgate suggests that Deleuze is so driven to denounce and resist all codifying and objectifying attempts to institutionalise human equality that he rigidly commits himself to the view of an 'inalienable typological difference between men' (8).

Houlgate's third criticism is that Deleuze's fully self-affirmative Being, because it is not negatively determined, can have little value for us. The problem that emerges from Deleuze's position, because it does not rely on negative dialectics, is that selfhood is construed 'in an asocial, virtually anarchic way' (Houlgate 1986: 8). Deleuze sees the Hegelian idea of self-consciousness depending on another consciousness in order

to recognise itself as a patently weak, life-denying idea, and considers that it is only the slave who views consciousness in these terms, in this dogmatic image of thought. However, undialectical being is asocial because it affirms itself right from the start and so does not require any Other to determine itself, and it is anarchic because it will not admit of any law that attempts to limit its self-affirmative power. This variety of Being will not enter into any relation, nor will it subordinate itself to any law that it itself does not create and affirm. Hence the question Houlgate poses is this: even if this purely self-affirmative, lawless being were not an ontological impossibility due to the fact that it lacks negative determination, what *value* could it have for us? This type of being could only be a recluse or a god, neither of which speak of a satisfactory ontological position that would concern the real conditions of our shared human experience – the very aim of the Hegelian ontology Deleuze seems to sidestep in his own ontological theory of affirmative difference. Moreover, assigning the role of valuation to affirmative difference as a means of explaining the ontological truth of being will get us nowhere, for it would only create a non-society of lawless masters affirming themselves without any need for one another, and so therefore not really a society.

In summary, Houlgate objects not only to Deleuze's 'facile' interpretation of Hegel (focused mostly on the *Phenomenology of Spirit*), but to Deleuze's ontological position in its entirety. There can be no difference outside of Thought, Thought is what makes the different, and so all difference must be negatively determined. Houlgate is committed to this view in so far as he rejects Deleuze's conception of a self-affirmative Being that is internally differential. Moreover, he warns that Deleuze's self-affirmative being is merely the recipe for an anarchic solipsism, and so fails to truly grasp the nature of Being in terms of real concrete experience.

Houlgate's criticisms call for a Deleuzian reply. No doubt we cannot here entirely redeem or salvage all the claims Deleuze makes in *Nietzsche and Philosophy*, but by recognising that Deleuze's criticisms of Hegel in that text are primarily of an ethical and political nature we can thereby gain a point of entry into his ontological critique. In this way, while not offering a full response to these key criticisms, we will indicate a few points that indicate the plausibility of Deleuze's critique of Hegel.

First, Deleuze's version of difference and determination differs from Hegel's, and this distinction must be emphasised; in particular, that for Hegel the role of determination is performed by Thought, while for Deleuze determination occurs in what he calls the virtual. Second,

Houlgate's claim that Deleuze relies on opposition as a means of denouncing opposition can gain no purchase if serious consideration is given to what Deleuze means by affirmation as a forgetting of negation rather than an opposition to it. Third, Houlgate's claim that Deleuze's view of the master has no value for us is perhaps based on a hasty reading of how Deleuze a) critiques the master–slave dialectic and, b) advances the view of the noble and the base.

Deleuze will not introduce opposition between terms, for it is one thing to create an opposition between A and B (B is not-A, A is not-B), and entirely another to *distinguish* the two terms as merely different. Red and other colours are not *opposed*, but rather are distinctly different. Deleuze is not willing to oppose two types of negation: in the will to power, the negation of the Yes-saying of the reactive forces (which is implicitly a No-saying to life) is at the same time a form of affirmation. Active forces deny quantitative forms of subsumable differences by affirming qualitative differences. These qualitative differences are not the same as qualities in Hegel, for in Hegel the differentiation of qualities operates to the extreme limit of determination (redness is not-yellowness, not-greenness, etc.) whereas for Deleuze qualitative differences are expressions of force *without determination*. That is, there is always the chance that some hitherto unknown quality may express itself in a dynamic relation of forces, and that this quality will not be determined but rather an affect of Being. This affirms the not-yet known, the type of qualitative differences that recognition and the dogmatic image of thought cannot apprehend. Affirmation and negation are not in opposition, for, as Descombes explains, 'from the point of view of affirmation, the relation between affirmation and negation is (non-negative) difference, and not opposition' and so in the case of the master, he will 'never perceive negation as negative' (Descombes 1980: 164). That is, the master's negation of the slave is merely the product of his own affirmation, but the moment that the master recognises the slave as a slave, he loses his affirmative power. The master must not realise that the slave is pure negation, but rather must see that the slave's servile consciousness is just another example of affirmation (64). Following from this, the slave must not recognise the master's affirmative power or else risk ceasing to be the slave; the slave's existence as a slave depends on his viewing everything in terms of the negative, as oppositional. In terms of the will to power, its affirmative mode is to go to one's own limit. Immediately, at first blush, this *limit* sounds peculiarly Hegelian, but in fact it is quite different: this limit is not internalised in the master as it is for the slave (i.e., brought up to contradiction). The master

does not know the limit of his power, yet strives towards it, whereas the slave is aware of limits and opposition everywhere. This is why the master's negation of the slave is not perceived by the former as a negative limit, but as an affirmative power. Conversely, 'the Slave is blind to what makes active negation *another* affirmation; in it he sees only destruction, which he must resist with all his strength in order to be' (164). And so, the master does not recognise negation and the slave does not recognise affirmation. The master's active nihilism is perceived by him to be affirmative, while the slave sees this negation in an inverted view, as destructive.

This is why it is important to assess the *sense* in which affirmation and negation is spoken, for it is only from the viewpoint of negativity that oppositions can exist, and why the master's affirmative viewpoint sees only differences everywhere irreducible to oppositions. It is not that the master wilfully *ignores* the negative, but that the latter is *inconceivable* from his viewpoint. It is this viewpoint of the negative that is carried on in Houlgate's reading of Deleuze, for Houlgate locates an opposition between Deleuze and Hegel rather than a non-negative difference. The effect is that Houlgate, in his reading of Deleuze, actually appears to comply with the reactive image that Deleuze illustrates. Nevertheless, Deleuze's often polemical tone in regard to Hegelianism in *Nietzsche and Philosophy* may itself be construed as Deleuze himself creating an opposition. That is, Deleuze *may* be constructing an opposition either directly or indirectly, although this does not necessarily mean that the philosophical force of the text itself is submitted to this opposition. And if indeed Houlgate defends what Deleuze would call the viewpoint of the negative, then in order to be true to this viewpoint, Houlgate would not be able to find in *Nietzsche and Philosophy* anything affirmatively different but only oppositions.

Certain steps have already been taken to rescue Deleuze from the charge of merely being in opposition to Hegel. Deleuze's critique of Hegel is, according to Hardt, oblique because he engages proximate enemies: Kant especially.[2] However, this conclusion seems somewhat unsatisfactory and incomplete, perhaps betraying an unwillingness to confront the issues of Thought and Being that are continually at stake in the works of Hegel and Deleuze. If we were to rely on this line of argument, we would do little more than provide an excuse for Deleuze, and so render the entire project of comparing the claims of Hegel and Deleuze a moot and irrelevant point, if not invite a mere return to Hegelianism. For Deleuze to stay true to his claim concerning the affirmative mode of Being, even his active negation of Hegelianism

(if that is indeed what he undertakes) would have to be performed in such a way as to be truly affirmative and not introduce a mere opposition. This entails not relying on *objections* which can only multiply *un*creative critiques, or what we may call mere *criticism*. In essence, Deleuze must forget Hegelianism.

Houlgate will not admit a difference that is outside of rational thought, outside of a dialectical system that could effectively absorb this difference and make it into another variable in the synthesis: 'all difference is dialectically appropriated to establish the identity' (Lumsden 2002: 152). Difference is constructed by Thought that determines it. What Deleuze proposes as an alternative is effectively a subversion of rationality itself, a questioning of the primacy of consciousness and its appointed role in determining difference. What Deleuze thus sets out to do is to explore how Being can be determined without negation, without recourse to identity, representation and recognition. In order to satisfy the demands of this position, Deleuze will need to construct a very clear account of what it means to have a new and different image of thought that does not lapse into these modes of representation and the self-identical. In other words, he must demonstrate how the affirmative mode of being thinks the affirmative. He will reject Hegel's notion of difference as merely conceptual, as requiring a labour of the concept, for this involves a kind of negation that implies resolution, an *Aufhebung* of all differences. This demonstration takes place in Deleuze's later work, *Difference and Repetition*.

Houlgate claims that Deleuze fails to recognise the immanence of negation and mediation in affirmative being. There can be no qualitative identity between affirmative and negative modes of being. This means that Deleuze's 'inalienable typological difference between men' cannot be the institutionalising ground for equality (especially in the master–slave dialectic and its resolution), thereby placing legislative restrictions in favour of equality among individuals into serious theoretical jeopardy. But here we must pay careful attention to what Deleuze means by *master* and *slave*. The master–slave dialectic relies on a structure of opposition, patterned on a universal history of *ressentiment*. To avoid this opposition, and to clarify his view of affirmation without negation, Deleuze adopts Nietzsche's typology of noble and base. In the master–slave dialectic, there is reciprocal determination: the master needs to dominate the slave in order to be defined as a master, and the slave's identity is furnished by being servile to the master. In Deleuze's view, this is to rely on negative determination, hence in order to

punctuate the innate affirmative difference of the master and the slave, he reads them as 'types' according to the qualities of nobility and baseness. The 'noble' does not see the 'base' as a contradiction, but as different. If the noble dominates the base, it is precisely because the noble affirms the difference of what he is without comparing himself to the base. If the noble sees the base as contradiction, the noble ceases to be noble, for that would be to believe in the fiction of contradiction. Simply put, in terms of an analogy, the noble or active force that forgets negation is like the sculptor who sees the final product in the slab of marble and not the surrounding material to be subtracted.

In sum, it is a matter of *perspective*: to see things affirmatively or negatively. Following Nietzsche's diagnosis, Deleuze signals to us how the master (as creative being, going to the limit of one's power regardless of and indifferent to the legislative restrictions that prescribe total equality) has been dragged into the position of the slave, beguiled by the contagious character of reactive forces into recognising the slave and therefore surrendering the affirmation of the master. This becoming-reactive of the master is his succumbing to the viewpoint of the negative, and the slave triumphs. However, the slave is still a slave, for he remains in the reactive stage that denies life; a slave crowned is still just a slave – especially when the crown is weighted by a restrictive morality of *ressentiment*, pity and bad conscience. It is the transcendent character of morality that has subordinated the differential and intensive powers of creative being. It is law, patterned upon reactive morality, which acts as the limitation of power rather than the nature of one's own being. For Deleuze, power as embodied by law is a mere representation of power. The power the noble master exerts is not a representation of power, but will to power: difference, affirmative distinction. Deleuze is well aware of the issue of equality, and makes much ado of it in his critique in *Nietzsche and Philosophy*, and he is thoroughly uncompromising about the outcome of accepting equality since it is a patently reactive measure to subdue active forces. Egalitarianism, be it in the realm of science or ethics, always seeks to equalise differences and forms a kind of modern nihilism that denies the real differences between forces (Deleuze 1982: 45). A superficial analysis might yield the unfairness of Deleuze-Nietzsche's master/noble in relation to the slave/base. An egalitarian perspective would claim that such a disproportion of power disadvantages the slave to the benefit of the master. However, such a claim is weak on the grounds that the slave is a slave by virtue of having not been able to say *No* to affirming everything. Therefore, the slave does not give his affirmative *Yes* to life, and so to upbraid the master

for exercising his affirmative power is a symptom of base, petty and reactive morality that views the world only according to what it lacks. In the *Gorgias*, Socrates castigates Callicles' call for the 'strong few to lead' by countering that the combined power of the weak many can overpower the strong few. But it is Socrates' understanding of power as representation that sees power in this way, whereas Callicles speaks of power in terms of difference and noble distinction. As a corollary point, Deleuze-Nietzsche's philosophy is one of revolution. As such, what revolution does not have its share of inequality and bloodshed? It is in the preface to Nietzsche's *Human, All Too Human* that this is best articulated: 'a victory has been won – a victory? Over what? Over whom? An enigmatic, question-packed, questionable victory, but the *first* victory nonetheless: such bad and painful things are part of the history of the great liberation', and: 'evaluating on one's own account, this will to *free* will: and how much sickness is expressed in the wild experiments and singularities through which the liberated prisoner now seeks to demonstrate his mastery over things!' (Nietzsche 1996: 7). Moreover, the notion of equality – of equalising and rendering some utopian harmony through an absolute synthesis – is essentially reactive, a patent form of what Nietzsche would call Christianity as Platonism for the people. Not only does it presuppose the moral legitimacy of equality, it also presupposes that unity will, can and ought to be achieved as the 'greatest good'. Even so, this equality will still be unequal in so far as it will be to the detriment of active forces. It is a clear case of applying the leaded yoke around the fastest sprinter so that everyone will 'win.'[3]

The charge that an undialectical view of life leads to an asocial and anarchistic self is perhaps the most serious objection that Houlgate raises, for it calls into question the very value of Deleuze's ethico-political viewpoint. It is the uncompromising, 'asocial' self that affirms itself without that recognition by an Other on which Hegel's master-slave dialectic so depends. Deleuze's answer is to appeal to difference in-itself, the *unilateral distinction of Being*. The long answer to Houlgate's charge (which curiously rings with the fear of what Deleuze calls 'crowned anarchy') is to be found in *Difference and Repetition* and beyond, especially in terms of recognition and its host of problems. But more importantly, the claim that Deleuze's ontology fosters or creates an anarchic being as a product of affirmation is a very serious charge. Although this consequence may indeed be true, Houlgate does not elaborate further on what he means by anarchic, nor does he make mention of what Deleuze has in mind when he speaks of the *hierarchisation* of values. In essence, the 'law' by which being is determined precedes any

concrete law formed by consciousness. It is Deleuze's view that the true necessity lies in the higher principles of eternal return and the will to power, and not in what he would consider the false necessity of a negative dialectics that cannot, in his view, truly account for the necessary conditions that would bring two terms into opposition. Moreover, it is not at all certain that Deleuze's view is truly asocial, for, according to him, all is desire and difference, and it is this motivating quality of pure difference and desire without lack that truly motors the social. In his later works with Félix Guattari there is much discussion on the notion of bodies, desiring-machines, and their bearing on the socius.[4]

James Brusseau's account of Houlgate's criticism of Deleuze is particularly sensitive to the seriousness of Deleuze's dislike of objections. Brusseau says: 'Every criticism potentially reduces thinking to a chess match of minute complaints and arcane refutations having nothing to do with experience' (Brusseau 1998: 24). This is to say that Deleuze despises the variety of objections that create nothing, that are regressively mired in theoretical debate rather than spurring philosophy on to greater and more worthy ambitions (such as creation and experimentation). Objections – if any are to be made at all – should be generative, and should set aside right and wrong in favour of whether a concept is useful and productive. This view, that denies objections and issues that can be declared right and wrong, is indeed complementary to the entire ontological position Deleuze wants to take. To frame everything in terms of opposition, as right or wrong, is to lapse into the viewpoint of the negative. Houlgate only *implies* that Deleuze's understanding of Hegel is wrong; what he actually says is that it is a *distortion*. This can be taken in another sense in so far as we can view the term 'distortion' as implying not wrongness or an aberrant deviation, but a *variation*, a different way of interpreting.

Brusseau points out that Deleuze stands outside and distant from Houlgate's version of Hegel, and so Houlgate draws Deleuze into proximity, which means that he draws Deleuze into the reactive oppositions of Hegelianism (Brusseau 1998: 25). Houlgate castigates particular features and instances of Deleuze's treatment while praising him in turn, in a cycle of acceptance and rejection (Deleuze's reading of Nietzsche is persuasive, his reading of Hegel is a distortion). Deleuze and Hegel themselves become irrelevant in Houlgate's care, for he would rather focus his attention on their *relation*, a relation that is patently negative: 'Deleuze is not-Hegel, Hegel is not-Deleuze.'

As we stated above, Houlgate could be seen as drawing Deleuze into an unfair trap. He casts him in the role of the Beautiful Soul

who tries to mediate all contradictions, succeeding and failing in parts. Houlgate seems to imply – negatively by way of his critique intended to demonstrate where Deleuze is in 'error' – that there is a 'right' way of reading and critiquing Hegel that Deleuze fails to follow. What is being claimed here in Houlgate's objections? That Deleuze's reading of Nietzsche is persuasive while his reading of Hegel is distorted? Deleuze might remain sanguine about this charge, and would most likely agree with it if by distortion we mean creating something different, a mutation. Mapping Deleuze's reading as to what it lacks again presupposes a reliance upon the patently negative and reactive character of interpretation in the history of philosophy that Deleuze wants to distance himself from. In league with the will to power, it is the desire to interpret Nietzsche and to expose a portrait or a new way of thinking about Hegel that motivates Deleuze's work on Nietzsche. If the work is interpreted in terms of lack, then the true sense of desire (as will to power) is lost; buried under the imposed image of thought that hierarchically distributes good and bad, right and wrong, readings. This interpretation of Houlgate would be more on the side of Deleuze, and should here be acknowledged as such. However, despite the glibness of some of his objectors such as Brusseau and Hardt, Houlgate does raise very pertinent objections that require serious answers. As insightful as commentators such as Brusseau and Hardt are, their assessments may still border on editorialising in favour of Deleuze rather than seriously engaging the arguments Houlgate raises.

Crucially, one should not assume Deleuze is dismissing Hegel as irrelevant, for if anything the opposite is the case. Deleuze realises how important it is to address the Hegelian project, but he knows not to fall into the dialectical trap of negating Hegel and in turn becoming Hegelian as a result. Much akin to his treatment of Bergson, Deleuze's *Nietzsche and Philosophy* engages in a somewhat ambivalent antagonism contra Hegel. Despite his most vitriolic statements via Nietzsche, it does appear that his project is more indexed to Kant (cf. Hardt 1993: 27–9).[5] And, as Michael Hardt warns, if Nietzsche is positioned as a strict anti-Hegelian, Deleuze runs the risk of devaluing Nietzsche as a reactive tool for the negation of the Hegelian monolith, i.e., performing a dialectical operation that pits Nietzsche against Hegel (28).

Houlgate does pick up on what may be an apparent opposition in Deleuze in citing a well-known passage that could be construed as a direct attack against Hegel: 'We will misunderstand the whole of Nietzsche's work if we do not see "against whom" its principal concepts are directed. Hegelian themes are present in this work as the

enemy against which it fights' (Deleuze 1982: 162). As an important clarification, the genealogical task is concerned with locating the 'presubjective force or will' and not a particular person (Hardt 1993: 31). However, even if it is not a direct confrontation, this formulation may still also be read as Deleuze's form of creating an opposition. Nevertheless, there is a fundamental difference between engaging in an attack and being opposed to something: oppositions hold out the possibility of resolution through consensus or compromise whereas attacks are destructive acts not amenable to resolution. If Deleuze was merely opposed to Hegel, there might still be the possibility of that compromise, but Deleuze's own alignment with Nietzsche commits him to rejecting the possibility of a compromise with Hegelian themes (Deleuze 1982: 195). It is this alignment with Nietzsche that suggests Deleuze's critique of Hegel is indeed not mere opposition, but an attack. His assessment of Nietzsche is very telling of where Deleuze sees himself in terms of being in opposition to or attacking Hegel: 'The philosophical learning of an author is not assessed by numbers of quotations . . . but by the apologetic or polemical directions of his work' (162). Moreover, if Deleuze is interested in total critique, and total critique is destructive in its creation, then Deleuze's critique of Hegel cannot be adequately portrayed as mere opposition.

Against Houlgate's claim that *Nietzsche and Philosophy* offers only a selective critique of the *Phenomenology of Spirit*'s master-slave dialectic rather than engaging with anything beyond this one Hegelian theme, Hardt notes that 'Deleuze directs the Nietzschean attack not against Hegel's master and slave, but against an extrapolation from Hegel's *Science of Logic*. We no longer ask the question "What is the dialectical logic of being?" but "Who wills this logic?"' (Hardt 1993: 37). Hardt's appraisal of Houlgate's criticism and Hegelianism in general is thus that it 'fails to appreciate that Hegel's negative logic is required for determination' and 'its conception of self does not meet the requirements to achieve genuine interiority' (37). However, as Lumsden notes, what weakens Hardt's criticism is that nowhere does he engage with the theme Deleuze is attempting to critique: that of Hegelian self-consciousness.[6] Instead, Hardt assumes complicity with Hegelian self-consciousness, and so Houlgate's questions remain unanswered. Moreover, Hardt does not make clear where in *Nietzsche and Philosophy* Deleuze extends the critique of Hegel beyond the *Phenomenology*, but merely states that it does.

Houlgate claims that Deleuze fails to give sufficient thought to determination. This may be a bit hasty, for Deleuze has his own view

of determination, but it is of a variety that does not rely on Thought but rather on external movement, an opposition of terms where the opposition lies not in the things themselves but is introduced there by Thought. Moreover, as Hardt indicates, Houlgate assumes that Deleuze is trying to repair the Hegelian argument for self-consciousness and interiority, when in fact Deleuze is quite explicit in his rejection of both. Deleuze wants to explore the unthought of thought and a genuine interiority rather than a conceptual one. To fault Deleuze for failing to amend the Hegelian arguments would merely be to portray him as attempting to perform some degree of compromise with Hegelian themes, when in fact his tasks lie outside of them.

II. Judith Butler

Among the grand critical efforts of current feminist philosophy, Judith Butler ranks highly as a critical theorist with a modified Hegelian and Lacanian perspective on the issue of desire. Although a willing and capable reader of the poststructuralist tradition, she is not in accord with any conception of desire that does not rely on the notion of lack. Since, in her view, desire is a form of phenomenological experience, she both reads Hegel as a philosopher of experience and retains the function of negativity as a necessary structural function of desire in the making and re-making of identity. Despite her keen insights into the rendering of desire in the Lacanian sense through the experience of a sociolinguistic world in which identities are made and re-made, her reading of Deleuze is lacking in parts. First, she makes the bold – and often true – claim that to attempt an overturning of Hegel is to be brought back into the Hegelian system as an anticipated outcome of it. Her suspicion with regard to Deleuze is thus that his invention of an alternate metaphysical programme remains mired in a secret dialectical heritage. The method she will employ presupposes her perspective on desire, and she will go further than Houlgate does by assessing not only Deleuze's *Nietzsche and Philosophy*, but also his later works with Guattari.

In her endeavour to overcome many of what she deems confabulations of the Hegelian enterprise, she states that the 'immanent critique of the self-identical subject is in many ways overlooked by Derrida, Deleuze, and others who proceed to view Hegel as championing the "subject," a metaphysics of closure or presence, that excludes difference and is, according to his Nietzschean critics, also anti-life' (Butler 1999: 176).[7] Butler asks if this continued preoccupation with Hegel, even when programmatically a disavowal or rejection, is not in itself yet another

residual manifestation of the dialectical procedure, a stage of post-Hegelianism that Hegel himself had already prefigured. This would be the case if the cause of poststructuralism involved merely a rejection of Hegel; however, it fails to give credit to the careful and deliberate theoretical movements within this tradition that have already considered this outcome. Indeed, both Derrida and Foucault acknowledge that there is no rejecting Hegel without ostensibly becoming Hegelian. This perhaps highlights a major division in methodological approach between, say, Derrida and Deleuze: while the former employs an internal rupture (Hegelianism without reserve), the latter invents a new way out of Hegel without resorting to the crude oppositional bullying Hegel seems to invite.

Butler's second charge is specific to Deleuze's project: 'To the degree that Deleuze historicises the negative formulation of desire, he effects a break with Hegel that cannot be accounted for within Hegel's philosophy' (Butler 1999: 206). Two errors result that warrant our special attention. First, as we will later demonstrate in a brief discussion of desire in relation to Deleuze's conception of the body, Deleuze does not historicise any formulation of desire – since Hegel has already historicised the negative formulation of desire, Deleuze does not want to participate in such an impoverished view. Second, the fact that Deleuze's conception of an affirmative desire cannot be accounted for by the Hegelian philosophy is precisely the point, and in no way detrimental to his exercise, for Deleuze does not want his philosophy subsumed by the Hegelian variety.

More specifically, Butler refines her charge against Deleuze's conception of desire through her own reading of what Deleuze means: 'For Deleuze, no matter the hegemony of that [culturally prescribed law of desire as lack], it not only *can* be broken, but *ought* to be' (Butler 1999: 207). She is partially right and partially wrong in this formulation. Deleuze will point to the eventual 'forgetting' in the eternal return of finite reactive structures, but the structure of his ethical *ought* is not as forcefully united with a static form of the political as Butler would have us believe. Deleuze was not a manifesto writer, although his work has frequently been adopted for pragmatic purposes in ethico-political concerns.[8] If Deleuze espoused any type of revolution, it would not be in ideologically prescribed terms, for such forms are overcoded and tend to lapse into failure as their movement fixes the forces of life into the constituted framework of an image of thought, much in the same way Marxism lent itself to becoming dogmatic. Deleuze's revolution, if it can be so called, would be akin to Nietzsche's tortuous wheel of the eternal

return. A revolution, that is, involving both an ontological principle (being is made univocal; equivocal being passes away) and an ethical selection (the necessity of the will to power selects the active forces that can bear the being of becoming while the reactive forces are 'forgotten').

Butler reads *Nietzsche and Philosophy* in much the same fashion as Houlgate does: as primarily offering a critique of Hegel's master–slave dialectic. This, as we have already indicated above, is a common prejudice in the reception of Deleuze's text. A more subtle reading reveals a much more broad-ranging sophistication in which we can trace the theoretical gains Deleuze has made in his reading of Bergson, applied in turn in response more to Hegel's *Logic* than to his *Phenomenology* – and even engaging Kant and Plato more directly. To this extent *Nietzsche and Philosophy* stands less as a rejection of the determination of Being than as a total critique that, rather than attempting to refine Hegelian determination, proposes instead a declaration of univocal Being. This again illustrates Deleuze's operation of critique: as a productive and generative activity rather than an empty repositioning of old problems that only orient themselves towards repetitive criticisms. Just as the formula runs *empiricism = pluralism = multiplicity*, Deleuze also wants to say *critique = transmutation = difference = desire = affirmation*. Deleuze's aim is not to *re*-present or *re*-cognise Hegel through Hegel's posthumous adversaries, but rather to ground a critique of Kantian and Hegelian themes, *while also* demonstrating the ontological and ethical features of Nietzsche's theory of forces, will to power and eternal return, and how the totality of this critique will produce something new. Again, like Houlgate, Butler misses out on recognising the more proximate figures of Kant and Plato in *Nietzsche and Philosophy*.

Butler is correct in her reading that noble morality is an affirmation of difference in lieu of constant mediations of the dialectic to create a totalising identity, but she is still committed to the idea that Hegel can be tweaked and made into a personalising Hegel, a Hegel that can speak adequately on the issue of experience and its bearing on the desire-identity couplet that she sets into motion. She goes on to state that 'Deleuze does not take into account this celebratory conclusion to the *Phenomenology*, and we can surmise that he does not think it possible within Hegel's own terms' (Butler 1999: 209). But Deleuze will not accept the Bacchanalian revel that brings us back to the start once Absolute Knowing is achieved because it still subjects desire to an understanding through the negative. Going 'back home' is impossible for nomad thought, the thinking that always encounters the not-yet-known, the unfamiliar. This 'homecoming' feature of Geist is not only untenable,

but undesirable. It is a process of determining one's home or ground by going out into the world and discovering everything that this home is not – another tangible example of how Hegel takes his form of determination to the extreme. It is as if Deleuze wants to say that we will save a lot of time and grief, sparing ourselves the ornamentalising and circumspect features of a long dialectical odyssey, if we honestly affirm the ground as internally and substantially differential in-itself right from the start.

We must here dwell a bit longer on this notion of return, and on why Deleuze's vision of return is not of that variety of desire that seeks fulfilment to negate the negation that is lack. Hegel's phenomenological odyssey of Geist is curiously Miltonic. That is, the human subject leaves the simple and bestial bliss of the animals (empty empiricism) and undergoes a gruelling journey only to return home again as a whole and articulately concrete self. The constant alienation throughout the *Phenomenology* is a characteristic lack of certainty and the distance from absolute knowing. In Milton's *Paradise Lost*, Heaven is depicted as a place where substances are real whereas in Hell they are mere representations, alloys, ostentatious structures of false pomp. The unhappy consciousness of Satan and his separation from the place of truly robust Real of Heaven is signalled by Milton with his constant use of the word 'sad' in relation to 'Satan'.[9] Satan's lament is Geist's: 'the more I see pleasures about me, so much more I feel torment within me, as from the hateful siege of contraries'.[10] Hegel's Geist is the biblical story of Genesis with a happy ending. The difference between Milton's and Hegel's account is that Satan's return to innocence, to the place of his deposition on the throne in Heaven, is an impossibility.[11] Wagner, too, exercises this notion of return in his narrative when the hero who has been exiled acquires a level of glory that exceeds his prior status, and so returns triumphant. Freud also has his story of return to the womb, and it would appear that these reactive strains of return are numerous in theoretical and literary works, as a seductive fiction that gives comfort to the weary traveller in the throes of existential anguish. However, this is not the type of return Deleuze wants. It is the return of the reactive and vindictive type, whereas a true sense of return as eternal return is the affirmation of the return of the different. Thus when Butler accuses Deleuze of Rousseauism – in so far as his conception of desire implies a utopic vision in which we return to a state of nature and escape the corruption of the state – this is wide of the mark, precisely because such a return is a return to the same rather than to the different.

Butler later asserts that the 'postulation of a natural multiplicity appears . . . as an insupportable metaphysical speculation on the part of Deleuze'. That is, 'the appeal to a precultural eros ignores the Lacanian insight that all desire is linguistically and culturally constructed' (Butler 1999: 214). In Butler's view, Deleuze has set a trap for himself, since in order to constitute this newly minted theory of difference and desire against the Hegelian conception, he needs to make his political strategy practically extend to the cultural construction of desire without lapsing into a normative naturalist position in terms of desire. This criticism does present a real problem, but not one that dooms Deleuze's project to defeasibility. Butler, in relying heavily on the Lacanian model, is still defending a somewhat rigidified historico-Hegelian interpretation. In sum, she assumes a direct and continuous linkage within the cultural-linguistic structure as the genesis of desire. Butler wants to say that the social precedes desire, and imputes to Deleuze the opposite view of desire as a precursor to the social. But, in fact, Deleuze's claim is that desire *is* the social, that difference is already in (as forces) and a product of the social. That is, difference or desire is immanent in the social. It seems that Butler wants Deleuze to take the implications of his ontology of difference more seriously in such a way as to apply it almost directly within an already constituted cultural-linguistic world. In this sense, she drags Deleuze into constructing an opposition between desire and the social, the natural and the cultural (artificial), which he is not willing to make.

Butler argues that Deleuze's appeal to multiplicitous affectivity, or natural desire as a precultural eros, is akin to the projects of Rousseau and Montesquieu (Butler 1999: 215). Not only does this perform violence upon Deleuze's notion of the return of the different, it also implies that he historicises desire. Butler's criticism follows from her commitment to the idea that desire is lack grounded in experience, and that the satisfaction of desire is a return to identity. But to say that Deleuze historicises desire is an unfortunate misreading. If anything, Deleuze wants to move away from historicisation, for a historicised difference is the making of an external rather than internal difference, subsuming pure difference to an historical order that acts as its other. As Dorothea Olkowski notes, in her attempt to bring Butler back into a more penetrative reading of Deleuze, if we are going to speak of desire (or of difference for that matter), it is essential that we pay proper attention to Deleuze-Nietzsche's discussion of the body (Olkowski 1999: 44–5). As we have already witnessed in *Nietzsche and Philosophy*, a body is the meeting place of forces in relation, and this body can take

myriad forms, be they physical, political, geographical, chemical, etc. The power expressed in this body, as well as the power it expresses, is desire, but the variety of desire that experiments with forces. Returning to the *Gorgias* exchange, what separates active force from what it can do is the law. This is the reason why the weak do not actually separate the active from what they can do because reactive forces can only impose an inverted image of law (the candle in the eye of the dialectical ox). It is only through the shored up reserves of the juridical that reactive forces can triumph, but it is the false triumph of slave morality, for reactive forces – although successful in subjugating active forces to the law – are themselves also enslaved to the law. The law of desire sets up this notion of the lack, whereas the nature of desire as truly affirmative strives to go to the limit of its own power. The error in Butler's reading is to assume that nature is opposed to law, when in actual fact it is law that believes in this fiction of opposition, while nature is indifferent to contradictions of that order. Nature's 'necessity' is expressed by following its own inner difference to go to the limit of its power; it is not concerned with the kind of oppositional structures that the law sets up as limitations on what an active nature can do.

What is important about the Callicles–Socrates distinction in the *Gorgias* is its bearing on the idea of desire. Socrates' notion of desire is reactive in so far as the limit of desire will be determined by the law (as lack), whereas for Callicles desire represents the limit of the body and what it can do without the fetters of the image of law. This *puissance* of (not necessarily physical) bodies and their relation of forces incorporates both the Spinozist *conatus* (as that which desires to persist in its being) and the Nietzschean will to power (as that which strives to go to the limit of power). Thus we are left with an ethical view of desire as the *puissance* of forces in dynamic and differential relation, thereby – as Olkowksi points out – rendering Butler's claim that Deleuze is attempting to inaugurate an emancipatory *and* ontological theory of desire a misreading (Olkowski 1999: 46). Desire, for Deleuze, is neither purely *ontological* nor *structural*. Rather, it is *ethical* and *experimentally disruptive*. If desire is viewed as lack, as Hegel appears to support, then, following Deleuze's Nietzsche, there would have to be the possibility of an equalisation of forces (desire and lack entering into a synthetic union where the pain of separation comes to an end in a kind of satiety or *ataraxia*). For this reason, neither Deleuze's nor Nietzsche's formulation of forces permit by their very constitution any degree of equality. (It is this same pain-pleasure dialectic that permeates that folk wisdom which assumes that medicinal cures have value and effect if they are initially

awful to the taste or cause a certain degree of pain and displeasure, on which would follow the pleasure of health.)

In sum, it is our contention that Butler's reading of Deleuze remains marked with the Hegelian bias that desire is negative, and that the identity of the subject is only completed in synthesis with an object that will negate this lack.

III. Catherine Malabou

Houlgate's claim that Deleuze in practice actually confirms Hegel's dialectical view is echoed in part by Catherine Malabou, who develops this criticism in a slightly different direction, in terms of unity and multiplicity. If, in fact, Deleuze is a 'secret Hegelian' then his criticisms of the Hegelian project will lose *puissance* and fail to gain significant purchase, for his credibility as a critic of Hegelianism will be jeopardised by his very repetition of or reliance upon the Hegelian dialectical method.

Malabou, like Houlgate, is conscientious in distinguishing between Hegel and the version of Hegel Deleuze deploys in his critique of the dialectic: 'the Hegel that appears in Deleuze's texts is always the *single* figure of the thinker of identity' (Malabou 1996: 115). The definite article 'the' is enough in itself to suggest a fundamental difference or deviation between Hegel and 'the' Hegel Deleuze critiques. In terms of this version or caricature of Hegel, Malabou argues, Deleuze's primary interest is in demonstrating how the 'systemic, binary heaviness' of the Hegelian dialectic can only produce the identical by way of negativity, and so cannot effectively ground a truly affirmative theory of difference (115). As Malabou understands Deleuze's method, Deleuze restricts the Hegelian dialectic to being merely the sublation of difference and then demonstrates how this dialectic is a form of *ressentiment* (115). This *ressentiment* is that of Zarathustra's Ass, the one who bears everything, who brays his Yes to everything, and is incapable of saying No to the negative viewpoint. To clarify: what is burdensome is the infinite circularity of the identical by the negativity of the dialectic, how the *self* is constructed by means of recognition and representation, especially in so far as the Ass always affirms the terms and results of his own dialectical relation with the other.

For all his talk of concepts and conceptual personae, it appears odd that Deleuze never seeks 'to determine what the Hegelian equivalent of "conceptual personae" would be' (Malabou 1996: 116). Deleuze is quite diligent in demonstrating the conceptual personae in Plato,

Spinoza, Leibniz, Kant, and even Descartes, but why does he neglect to mention any Hegelian conceptual personae? Concepts, for Deleuze, are the dramatisation of ideas that both emerge from and constitute a plane of immanence (Deleuze and Guattari 1996: 75). Just at the moment Deleuze might reveal the conceptual personae of Hegelian concepts as differential mobile points on a plane of immanence, he recasts Hegel's immanent system as being merely the constitution of a plane of transcendence, bolstering the 'higher opinion' (*Urdoxa*) of the State and the learned scholars (Malabou 1996: 116–17). Hence, Malabou suggests, Deleuze views Hegel's system as being 'on a fixed plane, in the immobile image and severe and fatigued visage of the Prussian professor whose friends very early on nicknamed "the old man"' (117). What we are truly left with, she concludes, is a static and monochromatic Hegel who attempts to negate all differences in the service of the negative dialectic. It may turn out, however, that Deleuze is himself creating an oppositional structure in so far as he *opposes* his own theory of multiplicity to the bare and static unity (the false multiplicity of the *many* in the *one*) of the Hegelian system.

Malabou does not aim to reconstruct the Hegel contra Deleuze debate, which would, in her view, only reproduce the anti-Hegelian arguments in *Nietzsche and Philosophy*; instead, she pursues the problem of Deleuze's understanding of Hegel. One possible solution, that would perhaps entail a redemption of Hegel from the Deleuzian critique, would be to declare Deleuze's ontology of difference merely a romanticised continuation of the Hegelian dialectic, or a consequence already prefigured and anticipated by Hegel (Malabou 1996: 118). Such a reduction of Deleuze's ontology to a moment in the Hegelian dialectic, however, runs the risk of portraying Deleuze as a philosopher of the Beautiful Soul. For her part, Malabou acknowledges this solution to be a dead end, not least since Deleuze himself had anticipated the objection when he claimed that a positing of a multiplicity of differences in no way amounts to a mere yearning for the peaceful resolution of contradictions. The Beautiful Soul still clings to a belief in the primacy of negativity in order to gain an affirmation as a productive (and peaceful) result, whereas Deleuze rejects the primacy of negativity altogether. Hence casting Deleuze as a philosopher of the Beautiful Soul would not be an accurate interpretation, but a reduction (119). What remains to be determined, however, is whether his own philosophy of affirmation is not a mere inversion or contradiction of the Hegelian dialectic.

The only fecund operation we can perform, says Malabou, is a Nietzschean evaluation of the Hegel–Deleuze problem (treating both

figures as 'symptoms' in a genealogy) in order to uncover 'the network or dynamic constellation that *motivates* it' (Malabou 1996: 119). No solution or resolution can be found, for Malabou implicitly asserts that there can be no compromise between Hegel and Deleuze. However, to perform said genealogical procedure examining the interplay between affirmative difference with respect to Hegelian negativity would not be a Hegelian method of examining the issue (119).[12]

If there does not seem to be a method that would be fair either to Deleuze or to Hegel in comparing the two then what is to be done? 'If Deleuze manages to reduce Hegelian philosophy to a unity, the solution would no doubt lie in *problematising this unity itself*, in exposing its differentiated structure in other terms' (Malabou 1996: 119). Without following this hypothetical solution to its conclusion, Malabou suggests 'that the unity of Deleuze's Hegel *both is and isn't what it is*, one arrives at a crossing of pathways where one might encounter the real sense of the confrontation between these two philosophers' (119). The solution she has in mind is to create a complication in the relation between the two philosophers. Malabou describes how Deleuze interprets Hegel as follows: 'If, for Deleuze, there seems to be only *one* Hegel, this unity is brought about by two possible scenarios: *reduction* and *exception*' (120). In so far as Deleuze *reduces* Hegel to unity (the solitary figure of a negative dialectics of Identity), he makes of Hegel an exceptional phenomenon in his own work. Since Deleuze devotes special attention to Hegelianism as a problem (albeit not always explicitly), 'he becomes the *only one*, with all the negative respect one pays to an absolute *heteron*: unable to be assimilated and thus veritably other' (120). Effectively, Deleuze makes Hegel an other, the 'enemy', thereby replaying the same dialectical procedure he claims to reject: an initial external negation of specific differences between things. Hegel becomes, for Deleuze, absolute exteriority, an Other to be mediated; i.e., Deleuze can only define his project by its contradiction, this contradiction embodied in his version of Hegel. This reduction of Hegel as an absolute outsider (*heteron*) is a very special problem that necessitates our attention if we are to take Deleuze's non-dialectical philosophy seriously, and to address the question as to 'why Deleuze never recognises Hegel as his white whale, leaving the reader the task of recognising in his relentless opposition to the dialectic the impassioned limping of a Captain Ahab' (121). It is debatable whether Deleuze does indeed set up 'Hegel as his white whale', a veritable leviathan that he champions against, or whether this may be chalked up to an interpretive fancy on the part of Malabou. It does, however, seem plausible, at least given

some of the antagonisms Deleuze appears to present in *Nietzsche and Philosophy*.

Malabou returns to an extremely crucial point of division between Hegel and Deleuze, that of *becoming*. For Hegel, becoming cannot be the actual site of being, but is an intermediate stage or move towards the actualisation of being or nothing. Becoming in this instance has a clear teleological objective: the actualisation of being or nothing – although we acknowledge that this may be a simplification of Hegel's somewhat rarefied point. For Deleuze, being can only be a becoming, for there is no resting place or telos to being in so far as it is always in a state of becoming.[13] Becoming takes *time*, and the duration of becoming is inseparable from that of being (hence Deleuze speaks of a being *of* becoming), whereas Hegel's Being exists in a punctual temporality (Being exists in a *point* in time, like coordinates on a line).[14] Becoming for Hegel is (in terms of a becoming-being rather than a being of becoming) a not-yet complete being, for it has not been synthesised in the present as actuality, has not yet been individuated by a process of negative determination. This becoming can continue beyond being's first negative determination thanks to negativity: being, although temporarily complete in the present, is still not a unity, and so the dialectic motors being along until it has been synthesised with essence and the Idea. But this very privation that drives being onto the telos of its actualisation as both real *and* rational is still, according to Deleuze, more indicative of consciousness than it is of actual beings (Malabou 1996: 124). In effect, consciousness 'imprints on becoming a categorical movement that doesn't belong to it' (124). Rather, Deleuze's view of becoming 'is not a hesitation between the abyssal vertigo of absence of form and the security of a particular incarnation . . . Becoming is pure milieu . . . a momentary assemblage that cannot and will not give its reason for being' (125). This is precisely why, for Deleuze, representation cannot be suitable in understanding being. For if the being is the being of becoming, and becoming cannot be represented due to its constant movement in duration (thereby resisting the unity or static form of the self-identical), then being itself will not submit to being represented. If becoming is infinite, then there is no final or absolute form being can take: it continues becoming by an unpredictable, fortuitous set of encounters with other becoming-beings. This ateleological becoming would in Hegel's view be a bad infinite (130).

If Deleuze presents Hegel through the aforementioned unity of subtraction (reducing Hegel, in a sense caricaturising or abbreviating his system) and the unity of exception (Hegel as the exceptional figure

who receives the most enmity from Deleuze, and the only figure he will not directly confront), and if Deleuze wants to dramatise the history of philosophy qua figures that embody what he means by conceptual personae, then Hegel becomes a figure in Deleuze's own philosophical project (Malabou 1996: 120). If this is the case, then Hegel (as a figure or symptom in Deleuze's philosophy) is inclined to synthesise these two unities of subtraction and exception (129). This, it should be noted, would be the act of Deleuze's Hegel (as a dramatised figure), based on Malabou's interpretation of how Deleuze interprets Hegel. The result of this synthesis would be a unity of abbreviation in so far as the 'points of being are not subtracted from themselves. They remain potentially rich in qualitative multiplicity and intensity' (135). In the configuration of Hegel in his texts, Deleuze does not make the distinction between these two unities explicit, and so Hegel remains an Other, an outsider, in Deleuze's philosophy. 'Doing justice to Deleuze's finely wrought thinking concerning affirmation implies, in my opinion, affirming Hegel's role in it' (136). Hence, in accord with dialectical progression, the figure of Hegel remains a moment in Deleuze's philosophy. If that is the case, Malabou implies, then the difference between Deleuze and Hegel is not as radical as Deleuze or his supporters like Hardt and Brusseau would have us believe.

Despite the possibility that Hegel represents a 'dramatic moment' in Deleuze's philosophy, the fundamental error to be avoided is that of attempting a forced comparison between the two thinkers. For although both appeal to similar terminology in their respective enterprises – an unavoidable disciplinary inheritance – they approach the problem of difference and Being from alternative perspectives. Judging Hegel from a purely Deleuzian standpoint, or, vice versa, is an exercise that will most likely end in a stalemate, hobbled by the inherent limitations of such a comparative project. What may be retained from the debate is a focus on what emerges from each thinker's metaphysics in terms of what is produced. It is, in the end, a question of arguing over the *consequences* of their respective philosophical gains, beyond the distraction of taking issue with terminology alone.

Notes

1. Dorothea Olkowski (1999) is one notable example of this.
2. See Hardt 1993 and Smith 2001.
3. Cf. Foucault's preface to Deleuze and Guattari's *Anti-Oedipus*: 'Withdraw allegiance from the old categories of the Negative (law, limit, castration, lack, lacuna), which Western thought has so long held sacred as a form of power and an access to reality'; and 'Do not demand of politics that it restore the "rights"

of the individual, as philosophy has defined them' (Deleuze and Guattari 1983: xiii–xiv).

4. See Deleuze and Guattari's *Anti-Oedipus* and *A Thousand Plateaus* for a much more developed idea of what Deleuze has in mind in terms of the social, and how his earlier ontological and ethical principles are laid out on this 'plane of immanence'.
5. See also Smith 2001.
6. Lumsden 2002: 151: 'This passage makes it seem that the Hegelian notion of self-consciousness is somehow transparent or straightforward. Moreover, without some attempt to make a genuine engagement with these thinkers, we are left simply with an opposition.'
7. In her attempt to summarise the position of the many French philosophers in this Nietzschean inflected camp, Butler's comment still proves too broad a generalisation. There is a conspicuous lack of mention or careful study of other notable thinkers in this tradition (couched within her phrase 'and others') such as Klossowski, Barthes, Blanchot and Bataille, whose projects – although not strictly poststructuralist in the way English-speaking audiences have come to understand this term – still merit mention and study.
8. See Hardt and Negri's *Empire* (2000) and Foucault's *The History of Sexuality* (1980). The problem with these applications is that they tend to romanticise Deleuze's work.
9. See Milton 1998: Bk. III l. 499–523.
10. Milton 1998: Bk. IX l. 119–22. The word 'siege' in Latin is derived from *sedere*, to sit, the seat, throne. We are privy to the image of Satan chair-bound and beguiled by these oppositions without cease.
11. A good literary example of a successful return is found in Dumas' *Count of Monte Cristo* where the protagonist not only returns to his beloved, but succeeds in avenging himself and resuming his life where he had left off prior to being exiled at the *Chateau D'if*. This is yet another analogue of St Paul's Christ, who is made to return and exact vengeance against those who denied him. This vengeful character is the petty and reactive version of return.
12. Although Malabou does not show us what this genealogy would look like, or what would result from it, it remains an interesting idea worth exploring in more depth.
13. This is a delicate point necessitating a thorough discussion of Deleuze's conception to time, in particular the empty form of the present versus Hegel's full present where Being is said to reside. Economy demands that this issue be reserved for a future examination.
14. See Derrida 1982: 42. The negation of the point (say, pure Being and pure Nothing) is a line (Becoming), this line negated becomes a plane, and so forth.

Reading Orwell Through Deleuze[1]

John Michael Roberts Brunel University

Abstract

George Orwell has often been accused of articulating a naive version of empiricism in his writings. Naive empiricism can be said to be based on the belief that an external objective world exists independently of us which can nevertheless be studied and observed by constructing atomistic theories of causality between objects in the world. However, by revisiting some of Orwell's most well-known writings, this paper argues that it makes more sense to place his empiricism within the contours of Deleuze's empiricist philosophy. By recourse to Deleuze's ideas the paper argues that far from being a naive empiricist Orwell in fact engages in a reflexive exploration of his virtual affects through the particular events he writes about. The assemblage that is 'George Orwell' is thus comprised by a whole array of affects from this unique middle-class socialist as he crosses through particular events. Orwell subsequently acts as a 'schizoid nomad' who transverses the affects of others. As a result Orwell takes flight from his own middle-class surroundings in order to reterritorialise his identity within the affects, habits and sensations of others. By becoming a schizoid nomad Orwell is able to construct a critical and passionate moral standpoint against forces of domination.

Keywords: affects, empiricism, habits, George Orwell, Gilles Deleuze, nomad

I. Introduction: Orwell and the Problem of Empiricism

When one reflects upon the place that George Orwell holds in British culture it soon becomes apparent that perhaps no British literary figure

of the twentieth century has stirred up so much controversy than as is the case with 'St George'. Some see Orwell as a purveyor of radical ideals while others prefer to see him as hostage to a form of English conservatism (see Hitchens 2002). In academic circles these debates have been played out previously in the fields of political studies (for example, Ingle 1993; Newsinger 1999; Woodcock 1984), literary studies (for example, Rai 1990; Williams 1991), linguistics and discourse analysis (for example, Bolton 1984; Hodge and Fowler 1979; Fowler 1995), cultural studies (for example, Coleman 1972), and feminism (for example, Beddoe 1984; Campbell 1984). In many instances debates about Orwell have been concerned with the underlying philosophical standpoint he adopts in his writings. Some critics, for example, argue that Orwell clearly works from within a philosophical perspective that can be broadly termed 'naive empiricism'.

A common assumption made about empiricists is that they champion an atomistic theory of causality, namely that causality exists between two objects when a regular, constant succession can be observed between them (A causes B). According to its critics, there are a number of reasons why we need to remain sceptical of this causal theory. First, empiricists reduce a statement's empirical content to the actual or hypothetical regularity of relations between independent objects. But if causality can only be arrived at through observation then causal production as an independent phenomenon must be an illusion – an illusion that critics of empiricism reject (Harré and Madden 1975). Second, and relatedly, critics argue that empiricists merely explore the surface appearances of the world and thereby fail adequately to enquire into the underlying real causal powers of the world. Causal powers, on this understanding, refer to those 'real' internal mechanisms of the world which might not be observable to us but which nevertheless have tendencies to produce events at an observable level through their contingent interaction with other causal powers in the world. Capitalism, for example, has a real tendency to go into a crisis if specific underlying contradictions assert themselves in contingent circumstances. Thus the ideas we have about the world are generated not only by observable events – as empiricists are said to argue – but also from underlying causal powers (Bhaskar 1975: 13; see also Collier 1993; Dean et al. 2005; Sayer 1992).

Orwell is believed by some to have articulated a naive and simplified version of empiricism in his writings. Christopher Norris (1984), for example, is suspicious of Orwell's insistence that meaningful statements about the world are simply gathered from one's personal experiences. Such a viewpoint, suggests Norris, strays dangerously close towards

a naive empiricist agenda in which truth can simply be apprehended through our senses. While Orwell critiques ideological themes evident in 'pre-formed' words (for example, the word 'freedom') he apparently nevertheless favours the transparency of experience through which to understand the world. Norris is harsh in reprimanding Orwell for this seemingly simplistic empiricist observation:

> What exactly can Orwell have in mind when he conjures up a pre-linguistic stratum of innocent, original thought as yet untouched by the malign influence of words? ... These are crude formulations, but nowhere near as crude – or as hopelessly confused – as Orwell's way of stating the case. (Norris 1984: 254–5)

Raymond Williams also finds Orwell hard-going on these issues. Agitated at the supposed 'plainness' of Orwell's writing style, Williams bemoans the successful impersonation of the ordinary person pursued by 'St George' – the type who bumps into experience in an unmediated way simply by telling the truth about it. The inclination is then, problematically, to bracket out the social context of the writer and to cancel out his/her social standpoint towards the context s/he is observing (Williams 1981: 385). Even a sympathetic commentator, Ingle, similarly claims:

> For Orwell, reality, the external world, could be discerned by the undeceived intelligence of the ordinary individual ... by means of Lockean sense experience interpreted and codified by reason ... [F]or Orwell man's very humanity and identity were rooted in this capacity to apply reason to sensory experience, and man's capacity for reason led him to grasp the nature of objective truth. (Ingle 2007: 734)

But while it is indeed true to say that Orwell can be placed within an empiricist train of thought this does not necessarily mean that he also articulates a naive version of empiricism in his writings. Indeed, the purpose of this paper is to show that underlying Orwell's writings lies a more sophisticated empiricism than his critics often give him credit for. This claim will be argued for by re-reading some of Orwell's most well-known writings through the philosophy of Gilles Deleuze. Why Deleuze, especially since Orwell seems to be such a quintessential modernist writer at variance with Deleuze's writings? On one level the answer is relatively straightforward. Throughout his major works Deleuze continually develops a philosophically sophisticated version of empiricism. Importantly, Deleuze's empiricism does not merely explore how we come to know an external world through our senses and

perceptions of it; rather, it seeks to understand the forces of potential within the world, how these forces contingently assemble together during specific events, and how they impact on our sensations at a pre-subjective and pre-personal level (cf. Clough 2009).

The intention here is therefore simply to argue that it makes more sense to place Orwell's writings in relation to Deleuze's version of empiricism than to that of naive empiricism. More specifically, it will be argued that Orwell contemplates not so much something called 'objective truth' as what Deleuze calls 'affects', and that he acts as a schizoid nomad in using his own assemblage of virtual singularities, or affects, to traverse the embodied virtual singularities of other human and non-human objects at particular events. In the process Orwell takes flight from his own middle-class surroundings in order to reterritorialise his own identity within a wider network of power relations. By becoming a schizoid nomad, then, Orwell gains a more precise understanding of how his own assemblage of affects is caught up within various mechanisms of power. Orwell thus operates on a plane of intensity whereby different singular affects fold into one another both within him and through and within others and vice versa (cf. Massumi 2002: 24–8). This being the case, Orwell does not exist as a singular person but only gains an identity through a number of affects; affects which combine both human and natural intensities. At the same time Orwell is able to bring these intensities into his own writing in such a way that he manages to avoid suffocating the intensities he experiences through signification.

What the paper will therefore show is that, unlike the naive empiricist who wishes to impose their own 'sensory reason' upon the world to arrive at 'objective truth', Orwell is more interested in entanglements of intensive affects, in how these affects might be relayed reflexively through his own embodiment, and in how various affects transform his personal embodiment into issues of public relevance. None of this, of course, is meant to imply that Orwell's empiricism exactly mirrors that of Deleuze. But it is to suggest that Deleuze can help us rethink Orwell's empiricism in a manner that is more in keeping with what Orwell actually writes. To demonstrate these points, some of Orwell's most well-known documentary writings and essays will be drawn upon (for example, Orwell 1989a, 1989b), supplemented where necessary with some ideas expressed in his novels. But to begin with, we must first briefly examine the extent to which Orwell is in fact an empiricist. The next section will argue that Orwell is an empiricist of sorts, but one noticeably different to what is commonly understood by the term. This discussion will then lead on to our contention that Orwell's own

brand of empiricism enables him to escape from a debilitating relativism in order to become a writer engaged in a critique of society.

II. Why Orwell is an Empiricist of Affects

Lionel Trilling once claimed that while Orwell was no genius, he could nevertheless be elevated to the heights of being 'a figure'. 'Plainness' of writing and reporting is the foundation upon which this status of a figure is based. Orwell's main strength therefore lies in 'the virtue of... fronting the world with nothing more than one's simple, undeceived intelligence, and a respect for the powers one does have and the work one undertakes to do' (Trilling 1952: 220). It is, however, exactly this 'plainness' that has so infuriated some and led, in turn, to accusations that Orwell is a simple and naive empiricist.

There is little doubt that Orwell is an empiricist of sorts. For example, in his essay 'Why I Write' Orwell admits: 'So long as I remain alive and well, I shall continue to feel strongly about prose style, to love the surface of the earth, and to take pleasure in solid objects and scraps of useless information' (Orwell 1981: 753). The empiricist nuances of Orwell's description are obvious to see, especially his comment 'to love the surface of the earth'. Critics of empiricism would no doubt highlight the limitations of this approach, believing that it misses the opportunity to explore causal mechanisms that lie beneath the surface of the earth. However, there are other passages in Orwell's writings that seem to suggest a different empiricist standpoint is at work in his writings other than that of naive empiricism.

To begin to understand this alternative viewpoint let us momentarily look at a quote by Orwell from one of his essays – 'A Hanging' – in which he recalls his experiences working for the Burmese police force as part of the British imperialist state. In this particular essay Orwell describes the hanging of a male Hindu prisoner.

> It was about forty yards to the gallows. I watched the bare brown back of the prisoner marching in front of me. He walked clumsily with his bound arms, but quite steadily, with that bobbing gait of the Indian who never straightens his knees. At each step his muscles slid neatly into place, the lock of hair on his scalp danced up and down, his feet printed themselves on the wet gravel. *And once, in spite of the men who gripped him by each shoulder, he stepped slightly aside to avoid a puddle on the path.* (Orwell 1981: 364; emphasis added)

The quote alerts us to another type of empiricism evident in Orwell's writings, for what the passage conveys is a description of what it means to human: for Orwell, being human is, at least in part, being a bundle

of everyday habits. This comes through forcibly in the final highlighted sentence. About to be executed, the prisoner still nevertheless exhibits everyday habits of association: the simple association that stepping in a puddle makes one's feet muddy and wet. For Orwell, as we will see, it is such habits that, when brought together with other habits, engender passionate holistic feelings about social life that are also profoundly moral. Before we explore this latter point, however, we need first to unpack theoretically the notions of habit and association. Deleuze's work on the British empiricist philosopher David Hume is useful in this respect because here Deleuze outlines an innovative empiricist account of both of these terms.

In *Empiricism and Subjectivity* Deleuze argues that Hume is not primarily a philosopher of either knowledge or the mind. Rather, Deleuze claims that Hume is first and foremost a philosopher dealing with practical issues. For Deleuze, then, the real impact of Hume's insights is to demonstrate that empiricism is a practical philosophy based not upon 'abstract reason' but upon distinctively human characteristics such as imagination, passion and sympathy. Empiricism should not therefore necessarily be regarded as an atomistic theory of causality based on external causal relationships between objects in the real world. Instead, Deleuze contends that a more fruitful empiricist philosophy demonstrates how '[c]ausality is *felt*. It is a perception of the mind and not a conclusion of the understanding' (Deleuze 1991: 26).

By working through Hume's main ideas Deleuze argues that causal relations emerge by forming associations from impressions of sensations rather than through the discovery of atomistic causal relationships in the world. Before we investigate subjectivity and causality, insists Deleuze, we must first investigate and understand how reason is 'an affection of the mind' (Deleuze 1991: 30). Through the mind we receive impressions of sensation about the world around us and through these impressions we form associations about aspects of the world – the means by which objects are associated with one another so as to provide a causal relationship. And through associations we form habits and expectations about the world – the ability 'to move from the present to the future' (63). We use these habits to reflect on our own subjectivity and our own sense of self. If this is the case then reason is a 'kind of feeling' (30) that not only provides a habitual mode of practical activity, but also instils in us a reflective passion for the world. Thus whereas impressions of sensations only develop within the mind, impressions of reflection give an individual a sense of subjectivity, 'diversely qualifying the mind as subject' (97). On this understanding association presupposes 'projects, goals, intentions, occasions, an entire life and affectivity' (120).

A practical illustration of Deleuze's thinking on this subject matter can be gleaned once again from Orwell's essay on hanging. Just after we are given the description of the prisoner stepping aside to avoid the puddle, Orwell says:

> It is curious, but till that moment I had never realized what it means to destroy a healthy, conscious man. When I saw the prisoner step aside to avoid the puddle, I saw the mystery, the unspeakable wrongness, of cutting a life short when it is in full tide. This man was not dying, he was alive just as we were alive. All the organs of his body were working – bowels digesting food, skin renewing itself, nails growing, tissues forming – all toiling away in solemn foolery. His nails would still be growing when he stood on the drop, when he was falling through the air with a tenth of a second to live. His eyes saw the yellow gravel and the grey walls, and his brain still remembered, foresaw, reasoned – reasoned even about puddles. He and we were a party of men walking together, seeing, hearing, feeling, understanding the same world; and in two minutes, with a sudden snap, one of us would be gone – one mind less, one world less. (Orwell 1981: 364)

What is interesting about this quote is the way Orwell describes the condemned man through impressions of the mind of what Deleuze elsewhere will name as virtual singularities or affects: bowels digesting food, skin renewing itself, nails growing, tissue forming, and so on. These virtual singular sensations come together to form habits and probabilities (not stepping in puddles). This simple causal relationship is therefore *felt* by Orwell. After all, Orwell consciously describes his own felt experiences of the hanging – 'seeing, hearing, feeling, understanding'. And it is through his direct felt experience of the hanging event itself that Orwell is able to form the associations he does and from here to constitute a new set of relations from the simple habit of not stepping in the puddle. Orwell's description, then, is a rejection of the conventional philosophical meaning of empiricism 'according to which the intelligible 'comes' from the sensible, everything in the understanding comes from the senses' (Deleuze 2002: 41). In place of this conventional meaning Orwell embraces an alternative empiricist viewpoint which suggests that relations are independent of their terms. Or, to put the same point slightly differently, *relations* operate independently of *ideas* attached to terms, the latter being embedded in the significations of language (Deleuze 2002: 41–2; see also Buchanan 2000: 84–6; Colombat 2000: 17).

The distinction between relations and ideas is one constantly invoked by Orwell, particularly in his writings on language. In 'Politics and the English Language', for example, he suggests that one way to overcome what is today known as 'signification' is to let the meaning choose the

word rather than the other way round (Orwell 1981: 743). Elsewhere, in 'The English People', Orwell suggests that too many words and phrases become mere thought-saving devices, 'having the same relation to living English as a crutch to a leg' (Orwell 1970a: 43). What Orwell insists on here and in other essays is that written language should aim to capture the reality of everyday speech. Indeed, in his essay 'New Words' Orwell explicitly suggests that words should be weaved in with definable objects and relations existing in the real world. Accordingly, language is 'practically useless for describing anything that goes on inside the brain' (Orwell 1970b: 17). Feeling, emotion and sensation are too subtle to be translated fully into language, and much of these feelings fails to be conveyed through pre-defined linguistic forms such as 'ready-made metaphors', which for Orwell frequently go on to produce a 'filthy stew of words' (134). Orwell's rejection of 'ready-made metaphors' is thus a rejection of a language form that seeks to represent and signify pre-conceived ideas. It is therefore not too far off the mark to say that for Orwell this linguistic procedure fails to capture how the relations between one's sensations of the world are in contact with the real physical world; sensations which have the potential to be creatively combined in innovative ways so as to produce new visual images in language.

Returning to his essay on the hanging it is now possible to see how the distinction between ideas and relations is a crucial device which enables Orwell to express both the complex associations and relationships at work in the hanging event and his moral revulsion concerning public execution. One dominant *idea* pervading the essay is that execution is a normal matter-of-fact event. This is *signified* to the reader by what the various other figures (guards, jailers, a superintendent overseeing proceedings, a boy selling goods) *say* to one another about the actual hanging they witness. Yet the idea that hanging is a matter-of-fact event is destabilised by the *relations* evident at the execution. These relations are communicated not through language but through virtual singularities (for example, those of the prisoner) which then go on to open up a void in the idea that hanging is a normal matter-of-fact event. In other words, for Orwell, it is exactly what is not communicated by language that becomes the defining moment of the event he is actually witnessing. Ideas of hanging are turned on their head through their affectual relations: public execution is not a normal matter-of-fact event, nor should it ever be.

It is true to say that a phenomenological moment can be detected in much of what Orwell writes here and in many of his other works.

In respect to the hanging, for example, Orwell clearly describes an embodied intentionality in relating the prisoner's perception of his execution. This is both conscious (the prisoner knows he is to die) and precognitive (still, he avoids the puddle out of habit) (cf. Coole 2007: 415). However, we must remain cautious as to the extent to which Orwell can be brought solely within a phenomenological perspective. After all, Orwell deliberately comments on the virtual affects of the prisoner, and it is these affects which seem for him to present a more powerful, deeper meaning of the hanging event than do either intentional or (precognitive) subjective attributes. Such affects move within and without intentionality and involve amongst other things muscles of the prisoner which 'slid neatly into place', a 'lock of hair', and feet which print 'themselves on wet gravel'. These can all be taken as illustrations of what Deleuze refers to as 'a primary sensibility that we *are*' and demonstrate how 'we are made of contracted water, earth, light and air – not merely prior to the recognition or representation of these, but prior to their being sensed' (Deleuze 1994: 93; see also Kennedy 2000: 56–8).

The uniqueness of affects in this respect can be appreciated by comparing them with emotions. Massumi argues that one important difference between both is that emotions serve to narrate affects and thus often have a conscious moment to them. Affects, on the other hand, are a 'never-to-be-conscious autonomic remainder' of indeterminate bodily reactions to specific events (for instance, how skin registers an event before emotions narrate the very same event). Thus affects carry different intensities associated with the strength and duration of an event's impact (Massumi 2002: 24–5). Emotions often capture affects and enclose and name them so that we can then understand them at a conscious and intentional phenomenological level. In other words, emotions help us create a narrative around affects even if affects refer ultimately to non-conscious and non-phenomenological relations and not to ideas found in the language or in the emotions of a subject (see Deleuze 1988: 64; see also Wissinger 2007: 260–1).

In relation to the hanging essay this distinction between affects and emotions makes sense. The affects of the prisoner are emotionally connected by Orwell into a new narrative about reciprocal relations of hanging. That is to say, Orwell narrates the affectual relations of execution into emotional ideas about extensive relationships between 'parts' of the hanging event. He then reassembles these 'parts' into an emotionally charged 'passionate whole'. For example, the relational 'parts' of the hanging event that lead to the prisoner avoiding the

puddle acquire an emotional and moral 'passionate whole' for Orwell concerning the wrongness of hanging and ultimately the debilitating effects of British imperialism.[2] But, most importantly, Orwell instigates the movement from relational 'parts' to a passionate moral whole through his own body. Indeed, we, as readers, come to understand the passionate moral whole of the social injustice of hanging through the impact that the actual-virtual affects have on Orwell's embodied emotions. In effect, the event of the hanging brings into being a new becoming for and of Orwell.

We will later explore in more detail Orwell's methodological strategy of drawing on his own embodied affects to make critical observations of specific events, but at this point it is worth clearing the way for that particular discussion. Once more Deleuze's thought provides assistance in mapping out this moment in Orwell's writings, particularly in terms of his notion of singular affects as forces within the world that produce distinctive states of becoming within specific events. As potential states of being, affects bring together and break apart various energy flows through relations of movement and rest, speed and slowness, in often contingent ways (Deleuze and Guattari 1988: 300; see also Deleuze and Guattari 1984: 315–16). According to Deleuze, such relations can be captured through an assemblage of rhythm. Rhythm relates to the sensation a body feels without its organs – or rather, without organisation (Deleuze 2005: 32). Rhythm in this respect is also an intensive vibration: a wave which flows through flesh and nerve and traces itself therein. In the paintings of Francis Bacon, observes Deleuze, we see rhythm displayed in respect to the non-organic figures depicted. Bacon paints pictures of organs that remain indeterminate. He paints pictures of organs which assume different shapes depending on the affectual forces that flow through them. Bacon does not paint representations of life but instead chooses to paint pre-subjective forces that act on the nervous system of bodies and yet also remain outside of bodies (36; see also Deleuze and Guattari 1994: 168).

Naturally, it would be nonsensical to say that Orwell somehow prefigures Deleuze's specific observations on affects. A more modest claim is to say that Deleuze's work helps to illuminate and make sense of Orwell's commitment to a variant of this type of empiricist thinking. As we now know, Orwell also insists on one level that the human body is comprised of pre-verbal affects which vibrate throughout the body so as to produce states of intensity. Orwell provides an illustration of the rhythm of sensations in his experiences of fighting in the Spanish Civil War for the non-aligned Marxist POUM group against Franco's

fascists. While Orwell writes about his time spent on the battlefield in actual combat against the fascists, he also recalls other 'rhythms' of war which are not marked by such speed. War, for Orwell, is additionally a moment of rest and slowness, interspersed by moments of fatigue and boredom on the battlefield as one waits for combat. Flows of energy from the human and natural worlds vibrate across the body under these conditions and are assembled in unpredictable and contingent ways. Orwell is surprised that the greatest enemy in the trenches is not the fascists but the energy of nature itself.

> We were between two and three thousand feet above sea-level, it was mid-winter and the cold was unspeakable. The temperature was not exceptionally low, on many nights it did not even freeze, and the wintry sun often shone for an hour in the middle of the day; but even if it was not really cold, I can assure you that it seemed so. Sometimes there were shrieking winds that tore your cap off and twisted your hair in all directions, sometimes there were mists that poured into the trench like liquid and seemed to penetrate your bones; frequently it rained, and even a quarter of an hour's rain was enough to make life intolerable. (Orwell 1989b: 28–9)

Orwell's organs are transformed through the energy of nature, and the energy of nature assumes new potentials as it assembles itself in Orwell's organs. His bones become vessels for the liquid of mist, his hair is twisted by winds that cry out, and he is at the mercy of a sun that refuses to give heat and warmth.

But Orwell is also aware that vibrations of affects come to be narrated through embodied emotions. For example, the doomed protagonist of *Nineteen Eighty-Four*, Winston Smith, feels that the body is *the* location for understanding the distinctively human qualities of particular events in everyday life. Winston says:

> On the battlefield, in the torture chamber, on a sinking ship, the issues that you are fighting for are always forgotten, because the body swells up until it fills the universe, and even when you are not paralysed by fright or screaming with pain, life is a moment-to-moment struggle against hunger or cold or sleeplessness, against a sour stomach or an aching tooth. (Orwell 1983: 803)

Here, Orwell observes that while sensations move the body to 'swell up' this becomes manifest and narrated through emotions associated with social, natural and human qualities such as hunger, cold, or an aching tooth. Affectual sensations within distinctive events thus communicate something which is emotionally social about the event at hand.

Orwell's own way of exploring rhythms is motivated in part to demonstrate his capacity to affect and be affected by others and by a

surrounding environment (cf. Massumi 2002). One way to understand this tactic is to utilise Deleuze and Guattari's thoughts on percepts. Existing independently 'of a state of those who experience them' (Deleuze and Guattari 1994: 164), a percept does not rest in one's immediate lived experience as such but rather subsists in the zone of becoming, or in a 'zone of indetermination'. Percept refers to that zone which allows for the 'coupling of two sensations without resemblance' (173). This is the 'passing through' of sensations from one object to another so that a new becoming is created between both that escapes the immediate perception of a particular state of affairs. We see this in Orwell's rendition of the hanging discussed earlier. The condemned man is made up of a series of affectual singularities (bowels digesting food, growing nails, and so on) which go beyond his actual concrete manifestation of being that Hindu man just about to be hanged and enter Orwell's own embodiment. By viewing the condemned man as comprising a set of affectual singularities which combine with various other sensations, including those in Orwell, a 'percept' of the hanging event is created that goes beyond the empirical immediacy of the hanging itself. This percept brings about a moral passionate event in Orwell: the awful event of 'cutting a life short when it is in full tide'.

In the final substantive section we will return to these themes in order to draw out Orwell's methodology and its relation to his critical social observations in more depth. Before this, however, one final related issue needs to be addressed. For some critics argue that Orwell's insistence on using his own experiences as a methodological device to make social observations lead him to embrace a rather incapacitating relativism. According to Lucas (2004: 11), for example, Orwell's subjective empiricism injects a 'superficial immediacy' into his writings whereby assurance in his political beliefs is gained simply through experience rather than through any intentional theoretical approach. Others develop similar critiques to argue that Orwell lacks any objective basis from which to make his observations. Rai, for instance, insists that Orwell's belief that language is often used to deceive and to inject dominant meanings into everyday usage betrays an extreme form of relativism in which 'language and therefore communication is beset by an apparently inescapable subjective falsification' (Rai 1990: 124). Stuart Hall (1984) similarly argues that *Nineteen Eighty-Four*, Orwell's dystopian vision of the triumph of totalitarianism, is a distorted mimicry of complex modern societies. According to Hall, *Nineteen Eighty-Four* presents a picture of state power that simply imposes its will upon poor unsuspecting souls. The idea that the modern state must actually aim to

win hegemony from sections of the population, and thus must produce policies that at least respond to some elements of popular culture, is anathema to Orwell. As a result Orwell cannot see beyond power relations operating in modern societies.

The next section begins the process of providing answers to these criticisms. It will argue that Orwell develops his own take on the distinction between ideas and relations through the motif of 'vagueness' and that this motif is itself part of Orwell's broader empiricist theory of affects. Furthermore, Orwell's celebration of vague affects enables him to demonstrate how ordinary people might resist dominant power relations. This will then take the argument back to Orwell's own affectual methodology.

III. The Vagueness of Affects

Commenting on Charles Dickens, Orwell says that this acclaimed author combines 'a quasi-instinctive siding with the oppressed against the oppressors' with a Christian sensibility (Orwell 1984: 82). Dickens embarks on a radical journey in his novels without sermonising. He revolts against authority in a humorous manner that distils a human face without any highly worked out plans for social change. 'The vagueness of his discontent is the mark of his permanence' (81).

This basic motif of 'vagueness' is an important one for Orwell. Indeed, it informs his analysis of capitalism, which is in itself derived from his many experiences and, contrary to what Hall argues, from his deep appreciation of the potential resistance to authoritarianism embedded in popular culture. For example, in *The Road to Wigan Pier* Orwell says that the working class articulate vague socialist ideals. Socialism for them equals justice and common decency. The worst abuses are left out but life generally carries on much the same as before, 'centring around... family life, the pub, football and local politics' (Orwell 1989a: 164). Nobody disputes the fact that normative words such as 'justice', as well as others like 'equality', 'freedom' and 'liberty', are abstract concepts. Orwell's conviction turns on the surety that such concepts have found expression in all aspects of British life and therefore deserved to be honoured. They may all very well carry illusionary elements, as Orwell admits in his pamphlet *The Lion and the Unicorn*, yet they are powerful illusions affecting everyday conduct: 'national life is different because of them' (Orwell 1984: 150–1). Neglecting these ideals therefore implies neglecting a distinctively human and common culture.

But why is 'vagueness' celebrated by Orwell? One reason concerns his distaste for excessive intellectualism. Or, to put it in more Deleuzian terms, Orwell rejects that 'neurosis' in which a writer demonstrates 'no risk of seeing the power of life which runs through a work. All has been crushed in advance' (Deleuze 2002: 37). Neurosis is evident in such approaches in so far as, through clearly defined 'manifestos', 'ideologies', 'theories of writing' and so on, a writer imposes pre-conceived 'critical' significations onto an object of analysis. For Deleuze, this neurosis towards writing lacks creativity because of its failure to open itself up to the flux of life, to the different affects that run through the body of a writer and which go onto imprint themselves on the page.

Vagueness is Orwell's own device for denouncing something similar to the intellectualism of neurosis. Visiting the north of England's working-class communities in *Wigan Pier* planted in Orwell the view that the dogmatism expounded incessantly by many in the Church or disseminated by numerous socialist intellectuals just didn't exist among the working class. 'It is only the 'educated' man, especially the literary man, who knows how to be a bigot... The creed is never found in its pure form in a genuine proletarian' (Orwell 1989a: 165–6). Rather than reading every word of the Bible or talking incessantly about class struggle, the working class revel in their cheap luxuries despite the fact that these are a sorry compensation after years of being plundered by the rich. Even though their lives are on no account desirable, the workers have made the best out of difficult circumstances. Talk from some on the Left about progress being brought about through mechanisation only disaffected workers, leading to 'a spiritual recoil from socialism' (174) as creative life was seen to be increasingly sapped by industrialisation. Above all else, those 'possessing a technique which seems to explain everything... do not often bother to discover what is going on inside other people's heads' (173). Or, to put it in more blunt terms, they do not bother to understand people's everyday vague experiences.

What these writers therefore lack is an 'emotional sincerity' of the sort that Orwell finds in the American novelist Henry Miller. Miller's exceptional gift, Orwell claims in his famous essay on the novelist, is his aptitude for a style of fiction 'dealing with recognisable experiences of human beings' (Orwell 1981: 496). Specifically, Miller projects a familiarity with the reader beyond the confines of his novels by bequeathing 'the feeling that these things are happening to you' and by dragging 'the real-politick of the inner mind into the open' (497). Like Jonah inside the whale, Miller allows himself to be swallowed whole by his surroundings. Miller is thus secure in the whale's belly – 'the dark,

cushioned space that exactly fits you, with yards of blubber between yourself and reality' (514). Indeed, Orwell equates Miller's writing with those of First World War writers who turned their backs on the carnage they witnessed by simply switching off mentally from the destruction around them. Under these truly horrendous conditions the only avenue open to remaining human was to write or think about a void, a space where other sensations might flower and blossom far removed from the surrounding destruction. Miller does not therefore stipulate how people ought to feel but how they *do feel* (516–17; cf. Deleuze 2002: 23).

Miller's writing style is in opposition to some other well-known authors of the day. Orwell notes for instance how W. H. Auden could casually scribble down the requirement for murder in the Spanish Civil War. Orwell's own encounters of people being killed in Spain had accorded him 'some conception of what murder means – the terror, the hatred, the howling relatives, the post-mortems, the blood, the smells' (Orwell 1981: 510). In this instance Auden simply imposes linguistic pre-significations, his neurosis, onto a minimal linear narrative of the Spanish Civil War, without trying to understand the underlying sensations that murder causes in real events. 'Mr Auden's brand of amoralism is only possible if you are the kind of person who is always somewhere else when the trigger is pulled . . . It could only be written by a person to whom murder is at most a *word*' (510).

But Orwell's injunction to take everyday experiences seriously is not a plea to stay merely at the relativist level of concrete experience. Experiences for Orwell are 'vague' precisely because they do not appear in a clear and concise concrete form but rather live and breathe through what might be termed a complex and creative intermeshing of actual and virtual affects. And it is exactly these affects that open up a space through which Orwell suggests people gain the potential to become conscious of distinct power relations. Orwell's observations on time in *Nineteen Eighty-Four* provide an illustration.

One scene in the novel has Winston Smith take a bite of a piece of chocolate that stirs up memories of his sister, memories that the authoritarian government of Big Brother had tried to extinguish. 'But some time or another he had tasted chocolate like the piece she had given him. The first whiff of its scent had stirred up some memory which he could not pin down' (Orwell 1983: 815). It is the smell and taste of the chocolate that helps Winston to go back to his preserved virtual past, to fill in the interval between perception and recollection with another time-image that disrupts the linear narrative of the past given by Big Brother in the actual present. Orwell thus shows the importance of recovering a

number of times that travel along multiple paths: actual-virtual circuits. Memories thus emerge between the actual present image that passes onwards and the past virtual image which is preserved (cf. Deleuze 1989: 79; see also Colebrook 2006; Martin-Jones 2006). Indeed, for Winston, useless scraps of information and everyday ordinary objects initiate various time-images of different cultural heritages through the memories and affects they elicit. At a junk shop Winston buys a paper weight, an apparently useless object. Yet the paper weight holds an immense importance in 'belonging to an age quite different from the present one' (Orwell 1983: 799). A few solid objects become the key to a preserved virtual past, to a culture almost dead in the linear movement-image created by Big Brother, a culture which, once revived in Winston's mind, might open up a space for him to recognise himself as being different to how he actually appears to himself in the present.

The point for Orwell is that associations with one's imagination in both the past and present have the potential to create a passionate moral appreciation of one's conditions only if they are related to actual-virtual everyday affects. The main character in Orwell's novel, *Coming up for Air*, George Bowling, returns to the town of his childhood, Lower Binfield, in order to escape the oncoming threat of Nazi bombs during the Second World War. When he reaches his hometown he discovers none of the old characteristics he remembers from when he lived there as a child. Manifestly Bowling's desire to construct a linear movement-image of his past is out of step with his affectual sensations in the present. Returning to his hometown opens his eyes to a quandary. 'All those years in Lower Binfield had been tucked away somewhere or other in my mind, a sort of quiet corner I could step back into when I felt like it, and finally I'd stepped back in and found that it didn't exist… The old life's finished, and to go back to Lower Binfield, you can't put Jonah back in the whale' (Orwell 1983: 565). The events of his past remain just that – events of his youth, hazy images and untimely recollections that remained out of step with the smells, sights, sounds and feel of his current life.

Of course, the aim of Big Brother in *Nineteen Eighty-Four* is to enter the interval between perception and recollection, to stop people from producing new assemblages of affectual singularities that make connections between the past and present. 'The Party told you to reject the evidence of your eyes and ears. It was their final, most essential command' (Orwell 1983: 790). Winston Smith eventually realises this when he begins again to recall his own past. He manages to gain a faint vague image of being with his younger sister when they were

children. He thinks back to the time when he stole some chocolate from her. His sister immediately takes refuge in the safe arms of their mother; maybe an unconscious and trivial act by his sister, but it taught Winston a momentous lesson about the ruling oligarchy of Big Brother. 'The terrible thing that the Party had done was to persuade you that mere impulses, mere feelings, were of no account, while at the same time robbing you of all the power over the material world' (841). Big Brother's aim is to stop people feeling a vague sincerity by controlling 'mere impulses', by controlling everyday affects. Memories, then, are not just a bundle of emotions. Memories instead mix up the past, present and future and enable one to use affects in order to resist dominant power relations. Winston recognises the force of memories, which is why he secretly obtains a diary in which to document his thoughts. In it he writes: 'To the future or to the past, to a time when thought is free... to a time when truth exists and what is done cannot be undone... greetings!' (758).

The next section continues the discussion of how vague everyday affects might be used to escape the relativism associated with naive empiricism in order to develop a critical social theory. Indeed, we will suggest that Orwell manages to articulate a moral and political standpoint that dissolves the boundaries of objective and subjective. By recourse once again to Deleuze, the section will show that Orwell dissolves these boundaries by assembling affectual singularities evident in specific events within his own body that then allow him to make moral and political statements about an empirical context beyond how it immediately appears to the senses.

IV. Becoming a Schizoid Nomad: Or, an Assemblage of Moral Affects

When Orwell speaks about the importance of the body in helping one gain a critical awareness of one's surrounding environment he does not mean this to imply that the body simply represents, or signifies, an interior self-contained 'reality'. Instead, Orwell draws attention to the forces, or singular affects, that inscribe themselves on the body in contingent ways within the interiority of the context at hand and from forces exterior to the self-same context. One illustration of Orwell's thinking here is when Winston Smith describes his apartment block. Winston is struck by how a neighbour's apartment 'was shot through by a sharper reek of sweat which – one knew this at the first sniff, though it was hard to say how – was the sweat of some person not present at the

moment' (Orwell 1983: 754–55). The neighbour is not visibly present through his/her physical appearance within the interior context where Winston is standing. Nevertheless, the neighbour is present through his/her singular affects which themselves become entangled with other forces penetrating the apartment building such as 'the usual boiled-cabbage smell, common to the whole building'. In fact such is a smell's explanatory potential that in *The Road to Wigan Pier* Orwell judges it as a sort of responsibility to employ an aroma to convey the social intensity and reciprocal relations of a particular context (Orwell 1989a: 14).

But to assemble sensations in new and creative ways is no easy task. Certainly Orwell is aware that it is often difficult to surpass our own habits in order to understand the habits of others. In his novel, *Keep the Aspidistra Flying*, the middle-class character Ravelston is enticed into a working-class pub:

> Ravelston persuaded himself that he was fond of pubs, especially lower-class pubs. Pubs are genuinely proletarian. In a pub you can meet the working class on equal terms – or that's the theory, anyway. Ravelston never went into a pub unless he was with somebody . . . and he always felt like a fish out of water as soon as he got there . . . There was a moment's hush and people glanced inquisitively at Ravelston. He was so obviously a gentleman. They didn't see his type very often in the public bar. (Orwell 1983: 631)

Orwell is thus conscious of the difficulties involved in merging one's own experiences with those of others. In *The Road to Wigan Pier* he evokes the metaphor of a pane of glass to describe these difficulties:

> Whichever way you turn this curse of class-difference confronts you like a wall of stone. Or rather it is not so much a stone wall as the plate-glass pane of an aquarium; it is so easy to pretend that it isn't there, and so impossible to get through it. (Orwell 1989a: 145)

This separation between spatial frames of meaningful experiences does not, however, instil in Orwell the belief that it is impossible to achieve significant levels of empathy and understanding with others. On arriving in Spain to fight against fascism the first person to officially greet Orwell is an Italian militiaman aged about twenty-five. They shake hands and an immense sense of comradeship flows through Orwell's veins.

> It was as though his spirit and mine had momentarily succeeded in bridging the gulf of language and tradition and meeting in utter intimacy. I hoped he liked me as well as I liked him. But I also knew that to retain my first impression of him I must not see him again; and needless to say I never did see him again. (Orwell 1989b: 2)

Orwell momentarily submerges his thoughts and feelings with the Italian militiaman through the touching of hands. However, this special bond of intimacy is only fleeting and soon relapses back to one of different zones.

It is this realisation of the difficulties in merging one's own experiences with another that leads Orwell in *The Road to Wigan Pier* to ask his middle-class readers: '[I]s it ever possible to be really intimate with the working class?' Orwell thinks that it is not possible. Why? 'The essential point is that your middle class ideals and prejudices are tested by contact with others which are not necessarily better but are certainly different' (Orwell 1989a: 106). The crucial phrase here is 'really intimate'. Although Orwell wants to locate a common place with his readers and with those he deems to be treated unfairly, he does not believe that it is possible to diminish essential differences between them and him. While staying in working-class homes during his excursus to the north Orwell notes of 'the proles': 'However much you like them, however interesting you find their conversation, there is always that accursed itch of class-difference, like the pea under the princess's mattress. It is not a question of dislike or distaste, only of *difference*, but it is enough to make real intimacy impossible' (145). Orwell concludes that, for him as a member of the middle class, to pretend to be really intimate with members of the working class would be dishonest, insincere, and end up simply creating a degree of fictitious sympathy since 'to abolish class-distinctions means abolishing part of yourself' (149).

Yet, it is exactly through his assemblage of affects that Orwell can in fact gain a degree of intimacy with others. If we think of an assemblage as being characterised by its ability to map out its own territory by bringing together different molecular affects then there is also a process of 'deterritorialisation' as an assemblage seeks out new molecular affects to link up to during specific events. Deterritorialisation, in turn, raises the possibility that objects have a 'nomadic' existence. Nomads have no fixed spatial boundaries; they do not travel from A to B along a linear pathway. Nomads traverse a number of zones and boundaries. Indeed, they blur the boundaries between spaces by often being in two spaces at once (Deleuze 1994: 46). And by distributing themselves across an open space, nomads gain the potential of creating percepts of their surroundings – that passing through of affectual sensations between different bodies and objects discussed above.

It is by creating percepts in this way that Orwell becomes a nomad and from here can relate to his readers something about the sensations that

flow through the events he depicts. Indeed, it is precisely this assemblage of affects in distinctive percepts that develop in Orwell a schizoid state of being: the unbearable coming together of different states of becoming through affects. The tension between these states of becoming is summed up by Deleuze and Guattari in the term 'celibate machine': a schizoid 'cry suspended between life and death, an intense feeling of transition, states of pure, naked intensity stripped of all shapes and form' (Deleuze and Guattari 1984: 20) that lead one to feel both repulsion and attraction towards an indeterminate state of becoming.

We can begin to understand what this means by briefly turning to Orwell's own experiences. Visiting working-class towns in northern England, Orwell describes some of the awful conditions he was witness to. Once more the assemblage of his sensations is the main focus of attention for wider observations about the working lives of miners. In one scene Orwell is taken down a mine. Inside the mine cage he is within minutes nearly 400 yards underground. As he crawls out of the cage into the mine a terrible anxiety suddenly descends upon him. A miner, once out of the cage, has to creep 'through passages as long as from London Bridge to Oxford Circus' in order to reach the coal face (Orwell 1989a: 22). Being extremely narrow the passages make the excursion an excruciating endeavour. 'You have not only got to bend double, you have also got to keep your head up all the while so as to see the beams and girders and dodge them when they come. You have, therefore, a constant crick in the neck, but this is nothing to the pain in your knees and thighs' (23). The pain is so intense that 'a week afterwards your thighs are so stiff that coming down downstairs is quite a difficult feat; you have to work your way down in a peculiar sidelong manner, without bending the knees' (25). In the north of England, then, Orwell's sensations act as both repulsion and attraction to gain a critical insight into the working conditions of miners. Orwell thus produces an assemblage of sensations by temporarily merging his own bodily experiences with those of others in specific events.

In descriptions such as these Orwell certainly seems to articulate something akin to the 'double hermeneutic' method put forward by Anthony Giddens. According to Giddens, this method is founded on the relatively simple idea that any social investigation will comprise a 'duality' in the sense that 'the 'findings' of social science do not remain insulated from the 'subject-matter' to which they refer, but consistently re-enter and reshape it' (Giddens 1993: 9). For example, by collecting data which challenges existing ideas around an object of analysis a

social investigator might initiate a public debate around the object in question, which in turn influences future social investigations of the object, and so on. But how Orwell as a nomad operates is in fact quite at odds with the double hermeneutic method. Giddens tends to sever the link between the researcher and the researched. Ultimately, his method is based on an external standpoint in which different people, including the social investigator, occupy their own frames of meaning and descriptions of the social world, even if each frame makes contact with the other (Giddens 1993: 170). This external step-by-step guide to social research through the double hermeneutic method therefore posits a divide between the researcher and the researched. In contrast, Orwell develops and situates his own categories of understanding in the very moment of his actual-virtual experience. As such, he is able to evaluate his categories within practical encounters and actual events and at the same time generate an internal critique of these encounters and events.

This schizoid nomadic moment in Orwell's writing can be clarified by momentarily reflecting on the autobiographical procedures involved in his social analysis. Broadly speaking, autobiographical procedures tend to abandon psychologically reductionist explanations of the individual, preferring instead the idea that people are fully social and cultural products (see Stanley 1992: 5). An autobiographical account is conscious of the fact that the self goes beyond the individual level as it reaches out to other lives and their experiences. Authorial power is a socially constructed phenomenon, a highly partisan accomplishment, which must also grapple with the complexities of social presentation to different audiences.

Orwell, however, discards the projection of an 'autobiographical I' veering towards an analysis of one's subjective life story and one's personal encounters in a social and objective environment. Indeed, he abandons the use of the subjective/objective dualism altogether. More precisely, Orwell focuses on the relation 'AND' that exists between subjective 'AND' objective. The middle term 'AND' is the zone of indeterminacy where subjective and objective fold into one another to create new assemblages (Deleuze 2002: 42–4). Orwell does not therefore converse with his readers from a subjective 'unified I' within an objective world but readily accepts and welcomes his indeterminate schizoid formation. His own character is that of the bourgeois English socialist typically mindful of his seemingly contradictory stance, but creatively playing upon it all the same. His public school background respects, even cherishes, Englishness. His socialism subverts it, yearns for elements to

be thrown away. This persona is constantly being creatively opened up through his nomadic experiences and it is Orwell's brilliance as a writer to publicly convey the intermingling of these different sensations on his own body. Contrary to Williams' (1981: 385) claim, therefore, Orwell does not simply bump into experience in a naive relativistic manner but allows a plethora of other actual-virtual affects to wash over his body and combine with his own sensations to create something anew.

V. Conclusion

Such have been the perceived debilitating consequences of naive empiricism in Orwell's writings that Raymond Williams was moved to admit that he could no longer read Orwell (Williams 1981: 392). This paper, however, has argued against the charge that Orwell is a naive empiricist who, thanks to this, is also a subjective idealist and relativist. Indeed, if what has been argued here has some validity then it is legitimate to ask why Orwell is so often accused of being a naive empiricist in the first place. One response is that he is too good at setting out what he says he wants to do, which is to make 'political writing into an art' (Orwell 1981: 753). For Orwell, this entails the ability to 'reconcile my ingrained likes and dislikes with the essentially public, non-individual activities that this age forces on all of us' (753). As such Orwell endeavours to assemble his empiricist and aesthetic feel for the world, including everyday and ordinary objects, and along with how he uses language, with the events he becomes part of and the indeterminate zones he visits. By entering these indeterminate zones the body of George Orwell is broken down into a new molecular bodily assemblage. Orwell's body momentarily merges with the affectual singularities (sights, sounds, tastes, smells, and so on) of an event and this remakes the virtual identity 'George Orwell'.

Orwell therefore demonstrates how one can utilise a language style that to all intents and purposes creates an asignifying way of writing. While Orwell is not of course the only writer who accomplishes this, his conscious and explicit injunctions to write in this style, and his numerous practical illustrations of how to achieve it, constitute perhaps one reason why his work still provokes such debate in the public sphere. We might add that, arguably, it is this asignifying ability that transforms his political writings into an art form. After all, Orwell is able both to convey his own affectual sensations through words and to break down the pre-conceived signifiers of language.

Deleuze and Guattari champion a similar approach to language. In their book on Kafka they note that

> Kafka deliberately kills all metaphor, all symbolism, all signification, no less than all designation. Metamorphosis is the contrary of metaphor. There is no longer any proper sense or figurative sense, but only a distribution of states that is part of the range of the word. The thing and other things are no longer anything but intensities overrun by deterritorialized sound or words that are following their line of escape. (Deleuze and Guattari 1986: 22)

Deleuze and Guattari find in Kafka an author who is able to describe states of becoming amongst collective assemblages. Kafka is interested in how language no longer signifies observable characters as such but rather can be made to describe the different intensities produced when different characters encounter one another.[3]

Notice, however, that what Deleuze and Guattari endorse in Kafka – how he 'kills all metaphor' – is not in fact taken up by Orwell. Refusing to reject metaphors per se, Orwell prefers instead to discard 'ready-made metaphors' and to 'let the meaning choose the word, and not the other way round'. His reasoning here is that metaphors are used in everyday speech to make sense of everyday experiences. The problem of rejecting all metaphors, then, is that one risks also rejecting a way in which ordinary people make sense of their lives. Massumi might very well claim that 'matter-of-factness' conveyed through language 'dampens' the intensity of affects (Massumi 2002: 25), but matter-of-factness is creatively used by Orwell to sense the affectual vibrations of ordinary lives. He therefore seeks to creatively produce new language styles through ordinary affectual singularities. Orwell's brilliance, in part, is to make this immensely difficult and complicated task look relatively easy.

Notes

1. I would like to thank David Savat, Tim Clark for his excellent copy-editing, and Colin Cremin, Monica Degen, Peter Wilkin and the external referee for their comments on a previous version of this paper. I would also like to thank the participants at Birmingham University's Sociology Department Seminar Series at which a version of the paper was presented, along with comments offered at BIG, Sociology and Social Policy, Leeds University, where I also presented an older version. Finally, much gratitude goes to Michael Roper at Essex University for giving me some invaluable advice about my initial thoughts on Orwell many years ago. All errors remain my own.
2. It is in this way that, as Deleuze suggests, passions 'give the relations a direction and a sense; they attribute them with a reality, a univocal movement, and hence a first term' (Deleuze 1991: 63).

3. Some of Deleuze's books, *A Thousand Plateaus* being the most obvious example, also attempt to work in a non-representational (asignifying) style (see O'Sullivan 2006; Massumi 1988).

The Empty Square of the Occupation

Marcelo Svirsky Cardiff University

Abstract

This paper is an attempt to implement Gilles Deleuze's theory of the series and the event, and the related function of the empty square (as formulated primarily in *The Logic of Sense*), in relation to the geopolitical regime comprising 'Israel proper' and the system of occupation in the West Bank and the Gaza Strip. The purpose of this exercise is to help establish a practical access to Deleuze's philosophies, and to offer a clinical account of the Israeli occupation of the Palestinian territories.

Keywords: Israel/Palestine, occupation, Deleuze, empty square, series, event

The regime of Israeli occupation of the Palestinian territories of the West Bank and Gaza, following the Six Day War of June 1967,[1] has become increasingly theorised, especially since the outbreak of the first Palestinian *intifada* (in Arabic, literally 'shaking-off', or 'revolt') in 1987. By deploying nuts and bolts from Deleuze's conceptual 'toolboxes', my aim is to proffer an analysis of the event of the occupation that frees us from prevailing views of the system of relationships between Israel and the Palestinian people. Specifically, the paper joins recent critical research deconstructing consensual representations of the conflict, representations that for decades have divorced the Israeli socius and its internal organisations of hobbled citizenship for non-Jews from the oppressive system of occupation in the territories. Hitherto, Zionist representations of the conflict have been successfully territorialised into ideological and political arenas, so as to mobilise most of the Jewish citizenry into the daily management, at both micro and macro levels,

Deleuze Studies 4.3 (2010): 381–411

www.eupjournals.com/dls

of oppression against Palestinians, and to disengage the international community from adopting a deep critical standpoint towards Israel. By injecting Deleuze's theoretical tools into critical readings of the conflict, we hope to contribute to ongoing interventions aimed at deterritorialising the workings of the desiring-machines involved in the social production of the real in the region between the Mediterranean Sea and the River Jordan. To this end, in the main I examine critically three recent and significant works on the occupation: Eyal Weizman's (2007) *Hollow Land*, Neve Gordon's (2008) *Israel's Occupation*, and Ariella Azoulay and Adi Ophir's (2008) *This Regime Which is Not One: Occupation and Democracy Between the Sea and the River (1967–)*. In addition, the analysis will refer to a highly recommended recent volume which compiles diverse studies of the 'prevailing modalities of the occupation regime in various periods and their order of significance'. Rather than convey a uniform image of the occupation, these studies 'highlight disparate rationalities and mechanisms of power whose heterogeneity reinforces the overall effectiveness and perseverance of this regime' (Ophir et al. 2009: 22).

These critical works will serve here as a platform for highlighting the traits of the 'system' of the occupation – or, in Deleuze's terms, 'how the series connect to make the structure' (see Deleuze 1990, 1994, 2004). As Lecercle explains, for Deleuze, the series 'define a field of problems, and their terms are correlated through a relation subject to constant variation and displacement' (Lecercle 2002: 108). What we are interested in is the *sense* of the event of the occupation as a surface effect produced by that displacement, which Deleuze explains in terms of the circulation of a paradoxical element – which needs to be explained here contextually – crisscrossing and zipping together the series of the structure of the occupation. This element is what Deleuze refers to in *The Logic of Sense* as the 'empty place or square' (also named 'the aleatory point', and, in *Difference and Repetition*, 'the dark precursor') – whose function is to explain the points of contact between the series and how they interconnect (Deleuze 2004: 184–9). As Deleuze puts it:

> Given two heterogeneous series, two series of differences, the precursor [the empty square] plays the part of the differenciator of these differences. In this manner, by virtue of its own power, it puts them into immediate relation to one another. (Deleuze 1994: 119)

This seemingly structuralist tint to Deleuze's philosophy is nevertheless consistent with his emphasis on univocity, and with the critiques he and Guattari make of biunivocal structuralism (in both volumes

of *Capitalism and Schizophrenia*, particularly in their critique of the despotic signifier and the 'binary logic of dichotomy', which dominates psychoanalysis and linguistics). In fact, this approach serves to highlight the production of sense taking place – since 'sense is produced by nonsense and its perpetual displacement' (Deleuze 1990: 71) – thereby keeping the structure open to constant movement and deterritorialisation and staving off stratification and the hierarchical functions of a signifier. Here it is worth bearing in mind that by examining a particular series of historico-political relations, what is productive, in terms of resistance, is to understand the sense of these relations not as 'a phenomenon of degradation representing a deviation from the true order', but as an involutionary process of becoming (Deleuze and Guattari 1987: 237–8) in which forces change in nature (intensity) and a real difference is actualised (Deleuze 1994: 231–46, 252–6).

Accordingly, the occupation cannot be thought of as an infection or disturbance of the normal functioning of the formally democratic regime of 'Israel proper' (assuming that, when it finally ends, the regime will be cured of the disease), but must rather be understood as a device which, by maintaining a fluid communication with the regime of 'Israel proper', both explains the Jewish state's practices and meanings and opens them to contestation. As we shall see, the 'empty square' of the occupation appears as emerging from the various combinations of historically and spatially changing modalities of the oppression of Palestinians across the 'Green Line',[2] creating intricate relations of abandonment (cf. Agamben 1998).

I. From 'Hollow Land' to 'One Regime'

Eyal Weizman's *Hollow Land* (2007) offers a good starting point, mainly in view of the attention his work has gained among Deleuze researchers. Weizman is among the non-resident Israeli academics who have been openly critical of the occupation project. In a nutshell, his book expands upon the evaluation of the 'matrix of control' of the Israeli occupation, beyond the traditional bounds of political territoriality, to the vertical dimension – extending, that is to say, not just to the land surface, but to the underground domain and to the airspace as well, all of which play a part in the logic of segregation from, and control of, the Palestinian people and its land. According to Weizman, Israel's elastic geography of nomadic domination responds to multiple and diffused power sources, in relation to which architecture fulfils a functional

role. Indeed, Weizman contends that the occupation – as a plane of production – has developed architectural properties. The reason we lack an intelligible reading of the occupation, he says, is because we overlook verticality. He builds on the concept of the 'politics of verticality' to outline the main patterns of a three-dimensional domination, compounded by a patchwork of sealed 'islands' of Palestinian territory which – like the subterranean water aquifer and the militarised space above – fall under Israeli control. An intricate web of roads, tunnels and bridges has been woven to secure Israeli colonies – which are generally sited on the summits of mountainous terrain – within the Palestinian territories. Moreover, Israel uses roads and land confiscation to curb Palestinian development, and to restrict Palestinian movement by introducing a 'forbidden road regime that [limits] the inhabitants' access to major traffic arteries in the West Bank' (Gordon 2008: 137). As a consequence, the diverse boundaries of the conflict are revealed at varying topographical latitudes (Weizman 2007: 12).

It is in this context that the subterranean and aerial Palestinian resistance in Gaza – specifically, the tunnels to Egyptian territory for the smuggling of goods and arms, and rocket attacks on Israeli towns near the border – should be understood.[3] For Weizman, this 3-D logic multiplies Palestinian geography 'to separate the inseparable' (Weizman 2007: 15). This is the same logic of partition which, as Ilan Pappe argued recently (Pappe 2009), has weighed upon both Palestinians and Israelis like a curse, condemning them for nearly half a century to seeing the conflict exclusively in terms of partition. Ultimately, we are left with a hollowed-out land inhabited in layers, and controlled through them.

From a Deleuzian point of view, Weizman's work has become known among scholars not only for the vocabulary he employs to describe the Palestinian space (elastic territories, multiple and diffused sources of power, nomadic domination, vertical strata, connecting flows, and so on), but mainly for an unexpected implementation of Deleuze and Guattari's spatial concepts. 'Walking through walls' was a trademark of the military campaign waged by the IDF (Israel Defence Forces) against the West Bank city of Nablus in April 2002 (during the second *intifada*), amidst claims that it was based on a particular implementation of critical theory, including works by Deleuze and Guattari. Terms such as 'inverse geometry', 'nomadic terrorists', 'swarming and infestation', 'non-linearity' and 'deterritorialisation' became part of the IDF's lexicon during the planning and execution of its offensive, which involved moving military units through domestic interiors – 'punching holes

through party walls, ceilings and floors' – and avoiding the use of streets and conventional urban open spaces (Weizman 2007: 185–6). As Shimon Naveh, a former co-director of the IDF's Operational Theory Research Institute (since closed), explained:

> Several of the concepts in *A Thousand Plateaus* became instrumental for us [in the IDF] ... allowing us to explain contemporary situations in a way we could not have otherwise explained. It problematised our own paradigm ... Most important was the distinction [Deleuze and Guattari] have pointed out between the concepts of 'smooth' and 'striated' space ... [which accordingly reflected] the organisational concepts of the 'war machine' and the 'state apparatus'. In the IDF we now often use the term 'to smooth out space' when we want to refer to operation in a space in such a manner that borders do not affect us. (Cited in Weizman 2007: 200–1).

For Naveh, theories do not have a soul, nor do they strive for utopian socio-political ideals ('theory is not married to socialist ideals'). He recognised that theories are based primarily on methodological principles, and focused on their capacity 'to disrupt and subvert the existing political, social, cultural, or military order' (cited in Weizman 2007: 215). Naveh is correct – nor should his claim be regarded as particularly outrageous. In fact, the case is illustrative. The point is not what can be done with theory or literature – which in any event cannot be foreseen – but how our actions relate to our desiring-production. The expectation that a 'correct' reading of Deleuze and Guattari might transform IDF officers and Zionist politicians into anti-segregationists or even humanists is a notion drawn from a classical Marxist interpretation of thought and action. It is not false consciousness that impedes revolutionary action, but rather the type of desiring-machines at work, and the entrapment of desire by interest (cf. Buchanan 2008: 38–133). In the case of 'walking through walls', the unconscious (collective) libidinal investment of the IDF assemblage 'continues to invest the former body, the old form of power, its codes, and its flows' (Deleuze and Guattari 1983: 347). In this instance, 'desire is enslaved to a structured molar aggregate' – namely, Zionist colonialism – and invested with the changing forms of power deployed by the system of occupation (348). Thus, there is nothing particularly revolutionary in the IDF's reading of Deleuze and Guattari – not because it facilitated domination and killing, but because the syntheses that it allowed for were already predisposed to given and fixed military and political interests, rendering the desiring-production paranoid and reactionary (366–7). In other words, it takes more than reading Marx to become Che Guevara.

To return to the issue at hand, Weizman – like other scholars of the conflict before him (Benvenisti 1984, 1986, 1987; Kimmerling 1989; Peled and Shafir 2002; Yiftachel 2006; Raz-Krakotzkin 2007)[4] – 'define[s] the limits of the discussion in terms of the boundaries of the space of control' (Azoulay and Ophir 2008: 371), and refers to a relationship or dynamic of dependence between the Israeli regime within the Green Line ('Israel proper') on the one hand, and the Israeli military regime in the occupied Palestinian territories on the other. However, it is a mistake to limit the discussion of the regime to the boundaries of Israel proper, since 'there is no such geopolitical entity' (371): the real geographical realm of Israel proper extends beyond the Green Line as far as the River Jordan, as does its economy and its politics. As Azoulay and Ophir explain, the problem is that these scholars uncritically accept the premise that the two entities are somehow separate, thereby ignoring the effects of the occupation on the regime of Israel proper. As a result, they

> perpetuate the prevailing view that the Palestinian territories constitute an 'outside' where everything that occurs – however appalling morally and politically – does not compel us to re-conceptualise and analyse the Israeli regime as a whole, and can therefore be described without reflecting upon the fundamental characteristics of the Israeli regime. (Azoulay and Ophir 2008: 46–7)

This circumscribed view of the effects of the occupation is also apparent in Gordon's Foucauldian analysis of the occupation. It is most notable, for example, in his book's final passage, where he suggests that a solution to the conflict hinges solely on the emergence of Palestinian sovereignty in the territories (Gordon 2008: 225) – or, as he puts it, on re-connecting the Palestinian people with its land. As I hope to establish in this paper (apart from placing the focus on problematisation rather than resolution), if we wish to deal more effectively with the event of the occupation and reach a more positive problematisation of the conflict for all concerned, we must link the processes and changes occurring within the territories with those within Israel proper. As Azoulay and Ophir point out: 'The occupation of the Territories in 1967 represents a rupture-line in the history of Israel, because as a result of this event a radical change took place in the Israeli regime' (Azoulay and Ophir 2008: 395).

The event of the occupation, as we shall see, obliges us to revise our concepts and understanding of the nature of the Israeli regime if we wish truly to grapple with this event on the political level. One facet of this effort must involve new formulations of what can be said in

our discourse concerning the conflict: we must intersect and make more immanent connections between the Palestinians of the West Bank and Gaza, and Israeli citizens and residents (Palestinians, Jews and others), and between their respective material and cultural interactions.

This, in fact, is the analytical innovation introduced by Ariella Azoulay and Adi Ophir in their book *This Regime which is not One* (2008). Beyond a mere demonstration that the two regimes are somehow connected, they demonstrate how the oppressive regime of Israeli occupation (in the West Bank and Gaza) and the formal democracy in Israel proper, form a single political regime consisting of two discrete, but symbiotic, systems of control. According to Azoulay and Ophir, despite their dissimilarities, these two political systems have become increasingly integrated since the start of military occupation in 1967 into a single body of domination. As they explain:

> At the end of the 1960s the state of affairs of the Occupation became a national project; in the 1970s it became larger; and at one point at the beginning of the 1980s the project was institutionalised and became a regime of its own, almost differentiated but not totally separated from the ethno-democratic regime in place within Israel of the pre-June 1967 borders. (Azoulay and Ophir 2008: 395)

By thoroughly investigating the system of domination of the 'one structure' and embarking on a comprehensive counter-actualisation of the given, the main purpose of these two writers is to decipher the conditions that allowed for the emergence of such a hybrid political construct. They also maintain that, after four decades of military occupation, the Israeli political regime has doubled in size in all respects, through a carefully engineered form of production of separation between its two parts – one maintained by proximity and interconnection – compounding the impact of this 'inclusive exclusion' upon the Palestinians (Ophir et al. 2009). In the following section, I shall try to show how a Deleuzian framework might expand upon Azoulay and Ophir's main contention vis-à-vis Israel's schizoid redoubling in size, and proceed from there to enhance and expand the optical resolution of their analysis, before finally offering a clinical diagnosis of the state of forces of the 'one regime'.

II. Two That Are 'One'.

Given that Azoulay and Ophir's book has so far appeared only in Hebrew, I will briefly outline its structure and rationale.

The fundamental question addressed by its authors concerning the Israeli project for Palestine after the partition war of 1948 – and especially after the conquest of the Palestinian territories in 1967 – is 'how the institutionalised and prolonged domination over the Palestinians has shaped and changed the Israeli regime' (Azoulay and Ophir 2008: 19).

Based on this question, the researchers aim at shedding light on the nature of the Israeli regime that is simultaneously 'one' body and yet more than one. The study sets out from two central premises: first, as noted above, that 'the debate cannot be limited to Israel proper, since such a geopolitical entity does not exist' (Azoulay and Ophir 2008: 371); and, second, that: 'The occupied territories are an integral part of the Israeli system of domination, [involving] a relentless effort to preserve them as an 'outside' . . . this being the Israeli regime's primary concern' (57).

The authors' task is to distil the general principles of the Israeli regime, which must be seen as extending 'from the Mediterranean Sea to the Jordan River'. This undertaking involves two major methodological measures: first, to describe empirically how the occupation regime works, by focusing on 'the forms of Israeli domination over the Palestinian territories' (Azoulay and Ophir 2008: 13); second, to link these modalities with their reverberating practices within Israel proper, and to synthesise their abstractions of the system of the occupation with the more general and known patterns of the ethnocratic regime within Israel proper.

What distinguishes Azoulay and Ophir's work is the way in which they present the problem of the occupation. While drawing on Foucault – without doing so overtly – their proposed analysis also owes much to Deleuze. First, by creating new concepts, the work removes restrictions that restricted the scope of critical understanding in previous analyses. For instance, they point out that while most scholars agree that the central distinction to be taken into account when conceptualising the Israeli regime is the ethno-national distinction between Jews and non-Jews, they omit the significant category of non-citizens, without which the formation of Israeli mainstream subjectivity cannot be understood (Azoulay and Ophir 2008: 377–9). Second, they distinguish between the actual and the virtual, allowing the conditions of the boundaries of the structures in question to be deduced, and thereby enabling a mobile understanding moving between the two realms.

Azoulay and Ophir's analysis does not offer programmatic solutions to the problematic of the occupation; rather, they search for what emerged to become the conditions of a project (the occupation) in the

course of its evolution over four decades. These conditions set out the 'solubility' of the problem of occupation in a Deleuzian fashion: they point to the significant changes in the historical 'graph' of the occupation, to the 'zeros' of its function (cf. Deleuze 1994: 171; 180–1). These are the points where distributions in the given diverged, illusions of identification and significations took root, and the occupation was established as the new possible of the Zionist–Palestinian structure. More importantly, it becomes clear from Azoulay and Ophir's analysis that the significant points of inflection in the 'problem' of the occupation do not exhaust the problem itself but should be seen as a manifestation of what has varied, and how it has done so, throughout the observed systems – in the form of a single infinite series of answers to a problem that is itself constantly evolving.

Azoulay and Ophir's book is a splendid exercise in poststructuralism.[5] Their starting point is Foucauldian: two dominant discourses on the event of the occupation are deconstructed in the book; the first concerns the occupation's temporariness (a temporal discourse), and the second, externality (a spatial discourse). The temporal discourse dressed up the occupation with a temporality that became indefinite by promoting a sense of imminent resolution, based on talk about 'peace for territories'. This linguistic space allowed for a professed Zionist readiness to discuss the *terms* of ending the occupation, while in fact standing in for, or perpetually deferring, any actual discussion about that ending. At the same time, the spatial discourse succeeded in placing the occupation outside the daily lives of most Israelis – as a distant space, physically and mentally, making it possible to bracket the territories away from the Israeli collective consciousness (Azoulay and Ophir 2008: 27). As Gordon points out, 'The overall objective was to weaken internal resistance to the Occupation, and since rhetoric does not always have to avoid contradiction, the Occupation was presented as simultaneously temporary, moral, and nonexistent' (Gordon 2008: 7). The main point Gordon stresses here is that in the discourse of the Occupation, it became a *temporary project and simultaneously exterior to the State of Israel*.

The intersection of the respective discourses of temporariness and externality is what gives the occupation the discursive force that has preserved it as a 'normal' or 'invisible' form of living (Gordon 2008: 49). These discourses explain how the impact of the occupation on the production of Israeli cultural, political and social life is minimised or eliminated. For instance, we find no reference to the occupation as such, as a system of colonial occupation, in the increasingly militarised

educational system (where it is explained as a space being negotiated for the sake of all involved);[6] in the perennial debates over the condition of Israel's 'democracy' (in which the occupation is presented as an ongoing test of a still-vibrant democracy, rather than its antithesis); in the discourse regarding peace and national security (where the occupation is presented as a 'necessary evil', for which the Palestinians themselves are responsible); or in discussions in which ethnic segregation (which has deepened since the occupation began) is presented as both justified and as a self-evident necessity.

These two suspensions have given the occupation project both life and legitimacy: if it is 'outside' Israel proper, then it does not reflect on Israel as a whole; and if it is temporary it is tolerable. This is the consensus that Azoulay and Ophir tackle in their book and which has resulted in two interlinked and appalling actualisations: the various modalities of oppression of the Palestinians across the Green Line, and Israeli normalcy. To examine this unfortunate situation critically, we must go beyond the limits imposed by the occupation's discourses and modes of thinking, modes of dominance, and general productions.

In terms of the operational political regimes involved, the status quo in the land between the Mediterranean and the River Jordan is as follows: within the Green Line – 'Israel proper' – there is a sovereign system operating along the lines of a sophisticated ethnocracy (Yiftachel 2006), which skilfully manipulates democratic tools and techniques to its own ends; the areas beyond the Green Line – the Palestinian territories held since 1967 – are subject to an oppressive colonial-military regime. The stark contrast between these two entities underscores the 'outside-ness' of the occupation and is related, according to Azoulay and Ophir, to two fundamental classifications which are also in play: first, a territorial division between the area within the Green Line and the occupied Palestinian space beyond; second, a division between two discrete systems of subordination: of citizens on the one hand (Jews and non-Jews – the latter being mainly Palestinian), and non-citizens (Palestinians) on the other. These distinctions, however, are merely plain and unadorned statements of empirical fact, and do not attest to the qualitative properties of the systems of domination. In fact, if this was all there was to the matter, they would point to a simple congruence of the 'territorial' and 'subordinate' classifications, rendering the detaching of the territories from Israel proper a redundant exercise. However, this is not the case.

The two classifications are not congruent because matters such as land, people, apparatuses of control and the market economy, do not

form separate planes of production divided neatly along the Green Line – contrary to the claims made by promoters of the so-called 'Security Barrier' (the Wall), now running through the West Bank, and of the barbed-wire fence along Gaza. Rather, Azoulay and Ophir's main argument should be read as follows: the occupation project has evolved in the Sea-to-River region as a dynamic system of domination, in which intertwining libidinal flows – of authority, of people, of material things, of cultural ideas, and of economic investments – run in both directions, from Israel proper into the Palestinian territories and vice versa. Particular forms of domination – of the Palestinians – arise from this organisation. As a result, trying to examine the two regions as two separate and unconnected entities is akin to dismembering a body and studying each part in isolation, in a bid to understand the function and properties of the anatomy as a whole. No interpretation could be more mechanical or more empirically wrong about Israel/Palestine.

By contrast, what emerges from a holistic examination of the Sea-to-River space, beyond the formal and tangible political systems, is the overall body that we do not normally see – the structure – which has no official existence as a recognised political entity, but which nevertheless impacts in a very real way on its subjects, given the reciprocal workings between its two constituent parts. The Sea-to-River regime is a manifestation of the order of the structure – a third order, defined by Deleuze as the *symbolic* (Deleuze 2004: 171–3). For Deleuze, the symbolic realm is the outcome of choices, selections and omissions of particular relations – 'a process where the symbol implies a rearrangement of relations in structures' (Williams 2005: 58). In this instance, the rearrangement occurs in the organising body of relations and connections emerging from the ways in which the occupation has evolved since 1967. This body is the latest stage of evolution of the historical encounter between Zionist immigrants-settlers and the native Palestinian people at the end of the nineteenth century, and provides the structural conditions for the real for Israelis and Palestinians. As a structure, it 'is defined as a necessary condition for the transformation of the thing' (54). By understanding this structure as a source of becomings for Israelis and Palestinians, we might 'read' more correctly how this body evolves and may be transformed. To put it another way, this understanding converts the conditions of impossibility into the conditions of possibility. In practical terms, it frees us from the limited and fanciful view that the occupation and its wider repercussions may be easily undone by a peace accord following a political resolution – as well as from the consensual model of the 'two states' solution. One

way to pose the question raised by Azoulay and Ophir might be: can Israeli citizenship, cultural habits and governmentalities be regarded in detachment from the systems of control of the West Bank and Gaza? From the point of view of the 'structure', the answer must be no.

III. A Regime of Fluxes

From the outset of the occupation in June 1967, Israeli domination has been applied concurrently but differentially to territories and subjects, 'making a clear distinction between the land it had occupied and the people who inhabited it' (Gordon 2008: 6). What has evolved is a system of 'confiscation without integration' involving

> a series of mechanisms... thus developed to expropriate the occupied land without fully annexing it, while numerous apparatuses and practices were introduced to regulate and manage the lives of the Palestinians without integrating them into Israeli society. (Gordon 2008: 6)[7]

This distinction, however, is incidental to the more fundamental principle of the territorial distinction, as we said, between the occupied land and Israel proper (Azoulay and Ophir 2008: 46). On the one hand, a complex legal patchwork system for governing the Palestinians has been repeatedly amended, incorporating elements of 'Ottoman, British Mandatory (particularly the emergency regulations of 1945), Jordanian and Egyptian law (depending on the region), and Israeli military orders' (Gordon 2008: 27). At the same time, the Israeli colonies[8] and settlers on the West Bank and Gaza have always been subject to Israeli law as if they resided within the Green Line (8). In other words, settlers, soldiers and other Israelis within the Palestinian territories have been 'extra-territorialised' and invested with 'personal jurisdiction', carrying the Israeli law on their person, as it were, within the territories, thereby expanding the functions and spaces of action of Israeli law. This embodiment of the law, in the most literal sense, has turned *movement* into a unit of analysis and of biopolitical application.[9] In other words, to the question of whose body it is, these expansions have added the spatial question of 'where'.

Moreover, the occupation is 're-imported' on a daily basis into Israel proper through those self-same bodies (settlers, IDF soldiers and officers, clerks, private companies' employees, and – ironically – also left-wing activists 'visiting' the territories for purposes of protest and support) – who by their very presence and the roles they play reiterate the

'doubled' or expanded nature of the Israeli regime. As Gordon describes it:

> Settlers are constantly travelling both within the OT [occupied territories] and to Israel, commuting to work, taking children to school, going shopping, and visiting friends. While these private trips are no doubt part of the settler's daily routine, simply by travelling within the OT the settlers fulfil several functions. (Gordon 2008: 139)

To manage the Palestinian territories – complementing the military administration which acts as the executive branch – Israel deployed various formal administrative ministerial committees made up of senior officials from government ministries, and – since 1981 – the Civil Administration, which was appointed as the governing body for all civil affairs (Gordon 2008: 30). On the economic front, the relationship that has arisen between Israel proper and the Palestinians has been 'marked by a series of constraints and restrictions that hindered the development of an independent Palestinian economy' (70) – the better to promote Israel's needs and interests. One hallmark of this interdependence is the securing of the Palestinian territories as a captive market for Israeli goods (Azoulay and Ophir 2008: 97; Gordon 2008: 70–5). Although the occupation 'opened up' new labour opportunities for Palestinians from the West Bank, East Jerusalem and Gaza (mainly in services), the dependency it engendered proved to be a double-edged sword, as it enabled Israeli employers – with the state's blessing – to exploit Palestinian workers as cheap labour, which in turn helped trigger the swift growth in the Israeli economy following the 1967 war (Gordon 2008: 66).

As Gordon explains, Israel has implemented various modes of economic power to manage the Palestinian population and economy: in the first decades for example, Israel used 'pastoral power' to promote a certain degree of Palestinian prosperity to discourage organised national resistance (Gordon 2008: 62–9): 'in exchange for their partial economic incorporation, the Palestinians had to contain their political desires' (82). But management here should not be understood in terms of Foucauldian confinement; rather, domination was based through the monitoring of moving bodies: a continuous control of Palestinians within the whole geography of the Israeli regime (cf. Deleuze 1995: 174–5). This is how, slowly, open fields, roads, streets, homes and workplaces – on both sides of the Green Line – became a multiplicity of sites of control.

The territories' colonial dependency has been compounded by the way Israel has expropriated Palestinian land (for colonies, military

bases, security, and roads infrastructure) and natural resources (mainly water), at the expense of Palestinian farmers (Gordon 2008: 127–8). It has also had disastrous consequences for the prospects of economic prosperity and a sound economy developing in the West Bank and Gaza. From the time of the first *intifada* – and, more acutely, since the second one – Israel has placed severe restrictions on the movement of Palestinian goods and workers (33–40; 185),[10] reducing the Palestinian economy to a precarious state of affairs and the Palestinians themselves to destitution.[11] The occupation became not only a means for the IDF to stimulate the Israeli economy, but for the colonies and the military regime to become targets of economic investment by Israeli private companies seeking to profit from servicing the settlers and the IDF system of control (electricity, communication, construction, and so on). All in all, as Gordon describes,

> At a certain point the distinction between government expenditures within Israel proper and expenditures in the OT was expunged from the annual budget, in effect transforming the entire area from the Jordan Valley to the Mediterranean Sea into one economic unit. (Gordon 2008: 8; see also 63)

The incorporation of the territories into the Israeli economy has ultimately led to their annexation in all but name. This includes controlling Palestinian imports and exports (in contravention of the 'Paris Accord Custom Union' of 1994);[12] skewing competition with Israeli products to ensure that the Palestinians are a captive market; imposing restrictions on Palestinian business and industry development to favour Israeli companies, who benefit from tax relief and the protection of the law for their exploitation of Palestinian workers; worsening restrictions on movement of Palestinian goods and labour through a complex regime of permits, and so on. No one today can imagine the Israeli economy without the territories.[13]

This state of affairs did not change substantially as a result of the Oslo process (which began in 1993) and the resulting Accords. Indeed, as Gordon maintains, these should in reality be seen as the 'outsourcing of the Occupation' (see Gordon 2008: 169–96), since they reorganised power by making the Palestinian Authority a proxy of the occupation regime. Although the establishment of the Palestinian Authority created a semblance of sovereignty (see Azoulay and Ophir 2008: 167–72), in fact, for the Palestinians themselves it has doubled the burden on a personal level: the Israeli occupation has given up nothing of its general spatial dominance, while ushering in a new regime of controlled human

movement, and slicing the territories into hundreds of separate enclaves and Jews-only spheres of movement.

In addition, land colonisation did not cease but was transformed in inventive new ways (for example, through more land appropriations for Jews-only roads and separation artefacts, and through what Israel ingeniously refers to as 'illegal outposts', which in reality extend the colonial fabric while portraying the illusion of a rule of law befitting a democratic state).[14] In fact, the only area where the Israeli regime has truly abdicated its responsibility is in relation to the civil welfare of Palestinians, which it has handed over to the Palestinian Authority while simultaneously undermining the latter's ability to provide welfare and manage the population (Gordon 2008: 192). In the final analysis, the Palestinians have found themselves facing two kinds of Israeli control – direct and indirect – depending on the type of territory they live in.[15] In effect, it might be said that Oslo silently 'killed off' the first *intifada*, while contributing a great deal to the normalisation of the occupation (182). This description of the various ways and means of oppressing the Palestinians in the territories shows 'that suspension of law and the forsaking of life do not completely overlap' (Ophir et al. 2009: 23): to deny citizenship and rights, Israel implemented power-regimes that activate law in different forms ('a tapestry of regulations, procedures, and decrees'), making clear that abandonment is not necessarily produced by scarcity of care (letting die), but rather the opposite, through active action. This is how irresponsibility, abandonment and perfection are held together. Azoulay and Ophir's critique of Agamben on this point is clear:

> The abuse of life at the hands of the ruling power is not due to some withdrawal of the law, but occurs thanks to a savage proliferation of legalities and illegalities and the creation of an extensive judicial patchwork that has no lawfulness of its own and that keeps changing the law itself, the regime's authorities and immunity, and the subject's own status before the law. (Azoulay and Ophir 2009: 114)

For Israelis, if anything clear-cut has emerged from the Oslo Accords, it is that they have bestowed legitimacy on the time-honoured notion of separation and partition not only as the logic by which space must be governed, but as the moral and political horizon to aspire to.

All in all, the project of occupation has created mutually supportive metastases (Israel proper and the territories), born as such due to the continual movement of material, human, legal, political, economic and cultural fluxes between them. In addition to these two spatial

paths of fluxes, there are innumerable other, related, fluxes, such as those determining the type of relationships between the State of Israel and its Palestinian citizenry, and fluxes forging connections beyond the territorial space of the 'Sea-to-River' regime (for example, internationally supported forms of resistance). All these fluxes are instances – particular (here-and-now) actualised sub-structures – of an unconscious structure: at this point I suggest that the structure explaining the functioning of the Zionist–Palestinian system or the 'one' Israeli regime in the Sea-to-River region corresponds to, following Agamben, a structure of abandonment (Agamben 1998: 2005).[16]

In 'How Do We Recognize Structuralism?', Deleuze states that every structure is a virtual multiplicity of serial coexistence, consisting of elements held by differential relations that continue into the determination 'of singular points that constitute a space corresponding to these elements' (Deleuze 2004: 176–7, 179–80, 182). Many series are involved in the production of this structure of abandonment: from the previous description of fluxes alone we can attest to the coexistence of politico-juridical, biological, economic and territorial series. The elements of the politico-juridical series, for example, include the rule of law, political rights, political subjects and political spaces (the camp and the public realm). The interrelations of these elements, and the differential relations between this series and the others, 'determine the nature of the beings and objects which come to realize them' (177). In the capitalist mode of production, for instance, exploitation and alienation are explained by the historical differential relations of property and appropriation holding between the symbolic elements of the labour force, the worker, nature, money and the segregated space of production (178). We will now go on to ask how the differential relations between the series of the Zionist–Palestinian system create values and attitudes (effects) that confer a relation of abandonment upon the structure.

This means we must 'account for the very particular presence of [the] structure in its effects, and for the way in which it differenciates these effects, at the same time as these latter assimilate and integrate it' (Deleuze 2004: 181) – in our case, then, we must retrieve the structure of abandonment (of Palestinians) of the 'Sea-to-River' regime by analysing its effects in terms of the actual impact upon life within those boundaries. Indeed, a structure not only 'lives' in the virtual, but in accordance with the logic of reciprocal causality 'also differentiates the species and parts, the beings and functions in which the structure is actualized' (180). The virtual multiplicity constituting the structure of the 'one' regime is embodied throughout the matrix of fluxes running across the

Green Line, 'according to exclusive rules, always implicating partial combinations and unconscious choices' (179). These fluxes carry and distribute parts and objects – such as the contested land, the soldier, the Palestinian farmer, the settler, the Jewish-citizen, the Palestinian citizen, the Palestinian worker, the economic relations, the colonies, the forms of authority and dominance, the forms of resistance, and so on – which actualise differential relations between the series by arranging themselves differently within each flow, forging different roles and functions and ultimately manifesting certain subjectivities.

From the point of view of the two metastases, the main conclusion is that since 1967, the occupation has broadened Israel's range of governmentability beyond the Green Line, and that the Line itself has since become a differentially permeable membrane through which a new political regime has developed. What is taking place is a dual dynamic of accentuation and erasure of the Green Line. On the one hand, the way in which the educational system within Israel proper has portrayed the occupation as a complete outside, the economic integration, the 'extension' of Israeli law embodied within the settlers and the colonies themselves, the colonisation of Palestinian land, labour and water – these have all but erased every vestige of the Green Line as a traditional frontier. On the other hand, the separation wall, the 'menial jobs without benefits and security' (Gordon 2008: 89), the regime of permits, closures, curfews and other instruments installed to control Palestinians' movements and to confine them, and the Palestinian resistance – all underscore the continuing existence of the Line. The changing location (always moving checkpoints for example) and varying porosity (changing the permit regime to allow passage according to age, profession, hours and so on) of the membrane striates the space of the 'in between' structurally, but not specifically – terrorising the entire passage-zone.

The endless traffic between the two parts of the regime attests to the 'extensions' produced by each flow. This perspective is revealing of the nature of this particular form of military occupation: it has evolved not only as a profusion of systems of control, surveillance and resistance, but also as a host of systems of mutual absorption between the territories and Israel proper.[17] The respective extensions of the two sub-structures together form a particular kind of connection. We have seen how they are joined together by the fluxes that render them interdependent; it is, however, a relation normalised by depicting the occupation as an 'outside' that should be disregarded. For most Israeli Jews, 'the part [i.e., the occupation regime] of the whole [the regime between Sea and

River] is grasped as extrinsic to the whole, and this is exactly how it is included' (Azoulay and Ophir 2008: 390). 'Most Israelis do not know the other part of the moon', as Azoulay and Ophir explain, yet it is nevertheless one and the same moon. This is how 'normalcy' has been incrementally established since 1967: upon a productive plane (political, legal and economic) which has fused together the Sea-to-River space in a particular manner, while at the same time presenting the occupation as something divorced from everyday life in Israel.

Azoulay and Ophir dub this situation *inclusion through separation*, or *inclusive separation*; more recently Ophir et al. (2009) have named it *inclusive exclusion* – that is to say, what is separated is retained, because otherwise:

> If the separation is completed, the project will come to an end and the regime will collapse, leaving just the two entities that constitute it... [conversely] if the separation is terminated, the regime will also collapse, since the two entities that constitute it will merge into one. (Azoulay and Ophir 2008: 391)

This is how 'placing the territories on the outside in fact amounts to their incorporation within the State of Israel' (Azoulay and Ophir 2008: 26). The logic of 'inclusive exclusion', therefore, is what prevents the structure from slipping either into complete annexation or into complete withdrawal (187). It is this suspended state that explains the productive aspect of the regime and its changes over time. The production is the result of a continuing struggle between two kinds of forces – one generating separation, while the other enhances the degree of involvement and contact between the two parts of the regime (190–2). 'The regime of the Israeli state is therefore the structure formed from the particular amalgamation of two different regimes under one roof' (330) – hence the label, 'two that are one'. In other words, there is no such thing as an Israeli or a Palestinian socius as a separate entity – there is only a common Israeli/Palestinian socius.

In this way, the occupation regime has transformed the government of Israel into the 'Sea-to-River' government, and – more crucially – its citizenry into an electorate for that government. 'The Israelis are also part of this regime as citizens – not only because for over forty years they have voted in 'free and democratic elections' for governments that persist in expanding and cultivating the system of domination in the territories', but mainly because their civic *habitus* became an instrument of the occupation (Azoulay and Ophir 2008: 400).

IV. The Empty Square of the Occupation

It follows that Israel cannot be contemplated on its own – nor can the system of occupation. Nevertheless, there is no formal structure between the Sea and the River in the shape of a unified regime, but rather a series of hybrid, disjunctive syntheses of fluxes. The dynamic of 'inclusive separation' suggests that 'the structure contains a paradoxical object' (Deleuze 2004: 184) – something that signals that the project is unfinished and lacks a clear and final identity, something that 'has become a permanent feature of the occupation regime and of the apparatus linking the two regimes' (Azoulay and Ophir 2008: 395). This object leaves behind the real as something unresolved, in a state of dynamism and discomfort. Something clearly connects the two regimes, and runs through them, displacing elements and generating properties in its path. This object, the paradoxical object of the structure, is the empty square: it does not remain in a fixed position, but is constantly moving; nor is it occupied continuously by the same element – thereby preventing the formation of an identity based on elements. It neither belongs to, nor is fixed by, either series, but is present in all of them dynamically. Its content can never be fully identified and, according to Deleuze, it prevents our minds from merging series together. In the case at hand, it has indeed been successful: although by rights we ought to, we tend not to think of the regime lying between the Mediterranean and the River Jordan as a single entity.

Is it possible for us to 'identify' the element maintaining the dynamism of the structure – the empty square of the occupation? What is it that ceaselessly slices through the series, crossing them and yet still capable of depicting their communication? What is this object that has enabled the regime's effective doubling in size, and its syntheses?

To answer this question, I shall examine the way the symbolic series are manifest through the fluxes running between the two metastases. Firstly, I adopt Azoulay and Ophir's distinction between '*the governed condition*' – that is, the formal-legal relationship of the subject to the state, and '*participation*' – namely, how hegemony and political dominance are constructed, and by whom (Azoulay and Ophir 2008: 379–81). Both dimensions highlight Agamben's structure of exception in politics. Citizens and non-citizens are ruled or governed differently, while the dimension of participation is absent in non-citizens but differentiates – in Israel – along ethno-national lines. Within the territories, citizenship eclipses ethno-national differences, since it is the Palestinians' non-citizen status that defines their 'governed condition'

and establishes the distinction and relevance of the sphere of citizenship. Within Israel proper, the ethno-national categorisation relies upon citizenship differences in 'participation' – a practice that is the *raison d'être* of the Jewish state.

Secondly, on the 'game-table' of the occupation, the shape of the empty square is governed by the combination or interdependence of 'the governed condition' and 'participation'. It is present in the fluxes running to and fro between the two regimes, and has varying values at different coordinates of time and space. The initial distribution at the start of the occupation in 1967 was the starting point. At that time, the Palestinian citizens of Israel were only a year into the new regime that followed the revocation of the military government they had lived under since 1948. So while Palestinian subjects within Israel proper were passing from meticulous control by the state to a more mild biopolitical subjectivation (Lustick 1980; Ghanem 2001), Palestinians in the newly occupied territories were about to become a subject of disciplinary power (Gordon 2008: 23–47): different 'rulings', and different 'participations' – for a divided people by one regime.

But as the occupation evolved, and fluxes started crossing it back and forth, elements began changing places in the series, producing a navigable border which in effect doubled the scope of the Israeli regime. The empty square communicates between the series by communicating between the flows running from Israel proper into the territories and back again, and its singularity resides in what it enables us to think – the transformations and becomings occurring throughout the series within the actual order of things. Thanks to the empty square, the series reverberate off each other (Gil 2008: 410) in a communication based on their intersections as streams of differences (not as identical items of a species), which in fact is the principle of emission of singularities, or of events (Deleuze 1990: 51). This works as follows:

> Once communication between heterogeneous series is established, all sorts of consequences follow within the system. Something 'passes' between the borders, events explode, phenomena flash, like thunder and lightning. Spatio-temporal dynamisms fill the system, expressing simultaneously the resonance of the coupled series and the amplitude of the forced movement which exceeds them. (Deleuze 1994: 118)

The relations between the series cause the two parts of the regime to make contact and merge, synthesising subjects and objects into a single body by displacing the system of subordination (of citizens and non-citizens) from matching the territorial distinction (between the two

sub-structures), thus generating a productive tension – or the 'problem' of the occupation. However, although this displacement defines the problem, it does not determine it fully, attempting as it does both to approach and to separate. In this context, we must remember that 'problems are defined by the way structures do not fit together and yet have internal drives to achieve that fit' (Williams 2005: 64).

While keeping in mind that power applies itself ubiquitously, shaping bodies and subjects everywhere and not only at one of its 'ends',[18] we might follow Gordon's example and argue that the communication between the series since 1967 has been constantly changing and expressing the transformations in the 'modes of power' and 'modes of resistance' between Israel and the Palestinians. 'During the occupation's first years', explains Gordon, 'Israel emphasised disciplinary power and bio-power…' while during the last years, and especially since the second *intifada*, Israel plays 'the more traditional mode of sovereign power – shifting from a politics of life to a politics of death' (Gordon 2008: 11–13; 115; 206–8). This 'shifting emphasis on one mode of power rather than another… [and] the interactions, excesses, and contradictions within and among the controlling practices and apparatuses… and Palestinian resistance' explains the 'changing nature of the occupation' (15).[19] For example, 'with the adoption of the separation principle' following the Oslo Accords and the modes of power implemented in response to the second *intifada*, the nature of the Green Line changed from a comparatively 'open membrane' to a border that is 'normally closed' to Palestinians, 'transforming the OT into a container of sorts' (212; 180).[20] On the other hand, since 1966 Palestinians in Israel proper have been increasingly challenging the promises of Israeli democracy by levering the discourse of rights and, lately, of multiculturalism for the sake of creating a more inclusive regime (Smooha 1990, 1997; Adalah 2007).

The relationship to the law (by way of another example) also changed regarding the territories: until September 2000 Israel controlled the occupied inhabitants primarily through the application of draconian laws (including the legalisation of incarceration of political prisoners, of deportations, house demolitions, torture, extended curfews and other forms of collective punishment), but, according to Gordon, the period since the second *intifada* has been characterised by a more violent abandonment of the Palestinians (Gordon 2008: 205). Uncertainty is assured by making it impossible for those in the territories to internalise the law, as Azoulay and Ophir explain: 'What the Palestinian learns in an encounter with the regime in one venue… does not teach him or her

what to expect in other encounters in other venues' (Azoulay and Ophir 2009: 115). Although we would like to move through a less arborescent model of the law, it seems that this somehow rhizomatic character does not enhance life. Here, once more, we have another striking example of how the IDF implement Deleuze and Guattari's conceptual tools. In parallel, as we shall see in the next section, a new assertive approach to laws having a direct impact on Palestinians in Israel proper (in terms of land, housing and loyalty to the state) has been adopted lately, marking a departure from the former policy of hidden discrimination.

The mechanisms for discipline and control of the Palestinians across the Green Line are integrated into a single plane of production of oppression, but operating from different strata, and through different assemblages, so as to shape different but connected subjects. As we can see from the examples, the pairing of 'the governed condition' and 'participation' is based on the kind of conditions Deleuze set for the empty square: when appearing in one place as an excess, it is manifested elsewhere as an absence (Deleuze 1990: 51). This enables the series to communicate in terms of reciprocal determination, and to flow as two branches of the same structure. The empty square is the element that attests to the historical sets of selections, omissions and syntheses in the actual – the symbolic element of the structure, the infrastructure. It is the event of the occupation that leaves its mark upon the series, changing them and their relations of sense, thereby 'making sense' of the problematic nature of Western democracy.

V. A Triangle of Subjectivities

In examining this developing state of affairs, Azoulay and Ophir are right to claim that 'the domination of the occupied territories is the **context** in which the government has acted since 1967, and whose constraints have governed its handling of outlying issues' (Azoulay and Ophir 2008: 26; original emphasis). The domination of the territories rapidly changed from yet another national task in 1967 into a project that became 'the fundamental matrix through which the government operates' (Azoulay and Ophir 2008: 26). As a result, it was not only the international community that started to view Israel through the occupation, but the regime itself embraced that outlook as well. At some point since the occupation began, four forces merged together, with irreversible consequences for the Israeli political and social regime, namely: unwillingness to incorporate the occupied Palestinians; persevering on the distinction Israel made between

Palestinian inhabitants and Palestinian land; the emergence of the criterion of citizenship to differentiate between occupied Palestinians and the Palestinians within Israel proper; and the devastating force of the ethno-national logic inside Israel proper. The syntheses between these forces crystallised the differences between occupied people and citizens, and created a relation of conceptual and practical interdependence between the *three significant subjectivities* emerging in the Sea and River space: on the one hand, the Palestinian subject – the non-citizen and pariah of the regime (exploited worker and oppressed political subject); his antithesis – the Jewish-Israeli citizen (Azoulay and Ophir 2008: 109); and lastly, the Palestinian citizen within Israel (living under a relationship of ethnically alibied abandonment). This triangle of subjectivities (conceptual rather than geometrical) embodies the empty square that actualises 'the governed condition–participation' pair, enabled by a twofold harnessing of the non-citizen status of the occupied Palestinians and the handicapped citizenship of those inside Israel. This connection points to what appears to be the most significant change introduced by the system of occupation in the Zionist–Palestinian structure since the assembling of the Zionist collective desire to 'cleanse' Palestine at the start of the national project in the early years of the twentieth century (Svirsky 2010), and the brutal widespread cleansing of the land in 1948–9 (Pappe 2006). Specifically, this change means that denying citizenship to the Palestinians in the territories reinforces ethnic restrictions within Israel; to put it more bluntly, the former became the logic of the latter. Viewed from the other side, we might say that for the regime – and for most Jewish Israelis – thinking about the prospects for the role the Palestinians citizens should play is almost never detached from the fact that the Palestinian territories are being occupied. The resonance between the Israeli public's acceptance of and acquiescence in the occupation on the one hand, and with the devalued character of the citizenship held by Palestinians within Israel on the other, is a consequence of the 'ethnic sounding-board' reverberating between the Sea and the River, and evident in all walks of life – be they legal, geopolitical, educational, social or cultural.

A few examples might illustrate the range and depth of this phenomenon. For many years, one of the state-controlled radio stations has broadcast a 15-minute programme called 'Friends and Family – Lost and Found' five times a week. People phone in to ask for help in finding friends and relatives with whom they have lost touch. Like many other shows on Israeli radio and television, the intended audience might be Hebrew or Arabic native speakers – or so one would

assume – but in reality the programme is broadcast in collaboration with the Jewish Agency and the Central Zionist Archive, and serves as a means for seeking out Jews who went missing during the Holocaust or its aftermath, or with whom contact was lost during one of the waves of immigration to Israel. No one in his right mind – Jew or Palestinian – would imagine a Palestinian citizen phoning in for information on his or her relative lost during the *Nakba*.[21]

Nowhere is this 'ethnic normalcy' more plainly evident than in housing policy, particularly when it comes to rural housing. Under the notorious 'Judaisation of the Galilee project' (launched in the early 1970s), many small and expressly Jews-only communities were established in Israel's northern region in a blatant attempt at demographic engineering (Yiftachel 1993, 1999, 2006). Following riots in the region in October 2000 – in which 12 Palestinian citizens were killed by the police – and in the face of threats by Jewish local authorities, the Israeli Ministry of Defence allocated funds 'to increase security', which meant enclosing the Galilean Jewish communities behind iron fences and electrically operated gates. This kind of physical landscape is reminiscent of that of the Jewish settlements in the territories – thereby further diminishing the significance of the Green Line and highlighting the occupation's expansion into the ethnic project taking place within Israel proper (Azoulay and Ophir 2008: 421).

To enshrine in law the existing ongoing exclusion of Palestinian families from these bourgeois rural communities, the Knesset has lately initiated legislation on the subject, echoing the internal codes of admission set by 'acceptance committees' established by the communities themselves.

In contrast to the old manner of concealed discrimination (which implied a measure of discomfiture), this time ethnic segregation is being overtly stratified (and justified) in a manner similar to the practice in the territories. The occupation has infiltrated and shaped action, thinking and subjectivities[22] in other areas as well. This is clearly demonstrated in the amendment to the Law of Citizenship of 2003, ratified four years later by the Supreme Court.[23] Although passed as a temporary provision, it has been re-enacted every year since then (echoing the discourse of temporariness used to perpetuate the occupation). According to this amendment, the right of equality in starting a family is seriously curbed for Palestinian Israeli citizens. On the pretext of 'security', it precludes a Palestinian Israeli citizen from applying for citizenship for their spouse if the latter is a (Palestinian) resident of the territories. Consequently, if a family wishes to stay together in such marriages, its only option is to

move to the territories, or abroad. Such is the plane produced for them by the occupation and Israel proper.

Increasingly, the sound of abandonment reverberates and connects Palestinians across the Green Line: although separated by the criterion of citizenship, this is what governs the relationship between the two populations of Palestinians, between their hobbled citizenship within Israel proper, and their managed abandonment within the territories. It is no wonder, then, that the emergence of a civic-democratic *habitus* in Israel lies far beyond actual conditions. The Israeli regime of citizenship/non-citizenship is a blunt example of how abandonment is exercised as a defining feature of contemporary politics – a toxin with no antidote. In the case of the Palestinian citizens of Israel, the ethnic barrier is what prevents them from becoming full and equal citizens, and it is structurally underpinned by another form of abandonment, namely, the non-citizen status of the Palestinians in the territories. In other words, given the latter exception, the former becomes logical and plausible: for the Palestinians in Israel proper, the realistic alternative to their situation is not full integration and egalitarianism, familiarity and proximity to the regime, but rather non-citizenship. Thus, the occupation must be understood not simply in terms of the radicalisation and endless restrictions placed upon the Palestinian citizens of Israel, but as the total alienation of occupied Palestinians so that the ethnic-based exclusion of the Palestinian citizens within Israel proper may be more easily ignored, managed and justified (Azoulay and Ophir 2008: 386). In this way, the realms of citizenship and non-citizenship are bound together, inasmuch as one defines the other, and the argument that the Israeli regime and citizenship cannot be understood without reference to 40 years of Israeli occupation becomes evident.

VI. Epilogue

In fact, Israeli democracy should be seen as the expressed form of the event that is the occupation; democratic life in Israel proper takes place amidst the exploitation and the total exclusion of the Palestinians from the territories (Azoulay and Ophir 2008: 431). To put it another way: 'the regime of the Occupation is an extreme instance of a known structural property of democratic regimes: the existence of a significant backyard of a ruled population that takes no part in the shared administration of public life' (Azoulay and Ophir 2008: 446).

The notion of 'democracy's backyard' is a clear echo of Agamben's structure of exception, and yields a fruitful discussion of what needs to

be transformed. The backyard may be democracy's hell, but it is also that which defines the democracy. Abandonment and exploitation are a given in this space. In the case of the Israeli regime, it refers both to the regime's split nature (it is not inclusive and yet universal) and to its physical boundaries (from Sea to River). It is embodied in the differences in how the various communities in that space are ruled – the aforementioned empty square, or pairing of 'the governed condition' and 'participation'. In the region bounded by the Mediterranean and the River Jordan, this square, 'the backyard', moves and takes on varying shapes and contents. The territories function as the regime's significant backyard, but at the same they are also the immediate backyard of the Israeli colonies. Additional backyards exist within Israel proper. The linking between the various backyards is what absolves the regime of responsibility for the harm done to the people populating them. By this method, the regime succeeds not only in putting the backyards out of mind, but in laying responsibility for them elsewhere.

Azoulay and Ophir's contribution to this discussion is to highlight how the exclusion of Palestinian citizens within Israel proper is seen as a fault that need not be remedied – or in other words, 'the alienation of the occupation as a regime is the flip side of the alienation of the non-Jewish citizens in Israel proper' (Azoulay and Ophir 2008: 442). At the same time, the reciprocal relationship between distance and proximity, and between citizenship and non-citizenship, in the Sea-to-River region, accentuates their contrasts, providing yet another significant sign left to us by the event of the occupation.

In light of all the above, it would be wrong to think of 'internal' changes within Israel proper – such as the notion of equal rights for Palestinian Israeli citizens – as taking place independently of events in the territories. The 'internal' must be seen as extending from the Mediterranean Sea to the River Jordan, given Israel's success in establishing 'dominance over the Palestinian non-citizens as a self-evident feature of the Israeli regime' (Azoulay and Ophir 2008: 430).

If the empty square of the occupation represents the boundaries of the structure, then only by introducing new differences within these boundaries can the structure be changed. Any substantive change in the structure of the Israeli regime must involve new deterritorialisations of the dyad 'the governed condition' and 'participation', whereby the struggle is taken up by all individuals in that jurisdiction, in a bid to change the form, the limits and the content of the regime in the area under Israeli control.[24]

Notes

1. As a result of the war, Israel also conquered East Jerusalem, the Golan Heights and the Sinai Peninsula (see note 2).
2. The term refers to the 1949 armistice lines agreed between Israel and Egypt, Jordan, Lebanon and Syria following the 1948 war (known in Israel as the 'War of Independence'). The Green Line refers to the border separating Israel from the territories of West Bank, Gaza, the Sinai Peninsula and the Golan Heights, before they were captured during the Six Day War of 1967. The Sinai Peninsula was returned to Egypt as part of the peace agreement reached in 1979. In 1981 Israel officially annexed the Syrian Golan Heights.
3. Handel explains that the Palestinian creates his physical and spatial resistance by forbidding himself 'to take paths generally considered accessible or even obligatory' (creating shortcuts and detours to avoid checkpoints for example) (Handel 2009: 215).
4. At the start of the 1980s Meron Benvenisti was the first to diagnose the system of control over the territories as fundamental to the Israeli regime, and pointed to the irreversibility of these changes (see www.matzpen.org).
5. Azoulay and Ophir disassociate their study from the critical tradition that sees Zionism as a colonising fabric, arguing that the occupation is not the inevitable product of a long colonial history (Azoulay and Ophir 2008: 22). Although they are right to refuse to reduce their analysis to assigning the given (the occupation) to existing given categories (Zionist colonialism), and to insist on forging new concepts for evaluating the given – by uncoupling their study from the historical storyline of Zionist colonialism, I believe that they withhold important layers of understanding. The genealogy of Zionist colonialism – to which we have access thanks to pioneering studies by the likes of Shafir (1989), Smith (1993) and Pappe (1999, 2004, 2006) – teaches us about the cultural and political processes we are engaged in. The past always plays a role in the present – 'for example, the consequences of colonisation persist and produce further effects, in social life as well as in the memories of those affected, long after the initial acts of settlement' (Patton 1997: 5). Thus, the colonial past which evolved from the initial Zionist–Palestinian encounter, continues to be evident in the present, playing a role which cannot be ignored. This is because the qualitative difference encapsulated in the Zionist colonial event did not abdicate its position of dominance in the Zionist–Palestinian plane in favour of new differences. Shafir's main thesis in his seminal work on the origins of the Zionist–Palestinian conflict (Shafir 1989) was that the logic of ethnic exclusion adopted by the Zionist settlement at the start of the twentieth century emerged from class struggles in the labour market. At this point, as I have already argued elsewhere (Svirsky 2010), a collective desire producing displacement-replacement began to be assembled (I defined it as a desire for terra nullius). This turning point continues to echo today. In other words, we cannot gain a comprehensive understanding of the occupation regime without taking into account the historical evolution of the colonial event of Zionism, and the ways in which desire has been and is collectively put to work throughout this project. My contention in this context is that the 'appetite' for land and the corresponding effects of expropriation, dispossession and expulsion of Palestinians was already an established and evolving Zionist habit well before 1967.
6. This is the case for example, with the civic-education official curriculum in high-schools. The subject of the occupation is treated in the official book in two sections: under the headings 'The national schism' and 'The ideological schism'. In both sections the territories appear with their biblical-recycled-Zionist names,

Judea and Samaria, and the issue is totally detached from any discussion on the relation of the occupation with the regime of Israel itself, and with its impact on Israeli political culture or ways of life. Most sadly, the connection between the maintenance of the occupation and the role the pupils studying this very book will play in that effort is also absent. (See *To Be Citizens in Israel: A Jewish-Democratic State*, Jerusalem: Ministry of Education, 1999, pp. 289–90; 332–45).

7. The legal integration of the Palestinians into Israel would have been detrimental to Israel's demographic desire to maintain a clear dominant Jewish majority.
8. The first colony was established as early as 1967. According to the figures published by the Israeli Central Bureau of Statistics, in 2008 the Israeli population in the West Bank colonies totalled 268,900, representing approximately 3.75% of the total Israeli population.
9. As Azoulay and Ophir explain: 'The Palestinian ceased to be he or she who is subjected to power. His or her existence was reduced to that of a moving body that interests the ruling power' (Azoulay and Ophir 2009: 135).
10. 'In 1970, 5% of the Palestinian workforce was employed inside Israel or by Israeli employers. By 1987, over 45% of the workforce provided 85% of the Palestinian gross domestic product, which gradually created economic dependence among Palestinians on the possibility of entry into Israel. This was due to a relatively free passage of people and goods to and from the OPT implemented in 1971 . . . [which] come to a temporary halt during the 1991 Gulf war' (and worsen afterwards as a response to the intifadas) (Shenav and Berda 2009: 338).
11. 'By 2007, Palestinian real per-capita income fell by 40% compared with its 1999 levels, and poverty rates soared to over 67% . . . Palestinian GDP has fallen by 30% over the past fifteen years' (Farsakh 2009: 379, 398).
12. In the economic treaties of the Oslo Accords, Israel also secured itself an unfair advantage, while bringing about yet further deterioration of the Palestinian economy (Gordon 2008: 185–7).
13. See http://www.whoprofits.org/index.php. This website shows who profits from the occupation.
14. Illegal or unauthorised outposts, as defined by the Sasson Report of March 2005 (submitted at the request of the Prime Minister's Office), are small settlements in the West Bank (there are more than a hundred) erected during the 1990s after building in the Palestinian territories was frozen by the Rabin administration (following the Oslo Accords). In the absence of an official governmental decision, any establishment of a settlement in the occupied territories is illegal. These outposts were built by groups of West Bank settlers in cooperation with public institutions; the leitmotif of this phenomenon was simply the expansion of the Jewish presence so as to make it impossible to reach a peace agreement.
15. The Oslo agreements defined three types of domination, combining civil control and security: A, B and C. Territories of type A are under Palestinian control (both civil and security); type B fall under Palestinian civil control, with Israel controlling security; and type C are under total Israeli control. All roads and border crossings remain under Israeli control.
16. I'm aware of Ilan Pappe's critique of using Agamben's paradigm to analyse the occupation (Pappe 2008: 148–70), and I agree that Israel must not be seen as a democratic polity corrupted to include exception for it never was a democracy in any sense. But what is important for me in using Agamben's paradigm is the conceptual framework it provides for analysing relations of abandonment: what characterised them, how are they maintained, by whom, and how they can be transformed.

17. Eyal Benvenisti wrote on the legal aspect of the absorption of the occupation. See Benvenisti 1990.
18. Power is that which connects between subjects, objects, practices and systems, transforming them from 'sides' into points of application.
19. I must say that, in a way, Gordon's formula for change (power–excess–contradictions–resistance and back again) appears to be a catch-all explanation for any phenomenon, and thus fails to capture the uniqueness of the event of the occupation.
20. The 'Wall' winding through the West Bank separates not only Israelis from Palestinians, but 'in many areas ... actually separates Palestinians from Palestinians' and from their land, in violation of fundamental rights and serving to 'create facts on the ground whose aim is to undercut the Palestinian state-building project' and to promote the annexation of lands by Israel (Gordon 2008: 213).
21. Al-Nakbah – Arabic for 'The Calamity' or 'The Catastrophe' – is the Arab name for the Israeli war of independence of 1948–9, when nearly 800,000 Palestinians were expelled from their homes by forces of the nascent Israeli state and their lands seized, destroying about 550 villages and neighbourhoods, and devastating the spine of Palestinian society.
22. For example, the 'Separation Barrier' – in reality, the Wall – through the West Bank affects the Israeli soldiers charged with guarding it: 'the Barrier transforms the soldiers into an effect of its own logic ... [becoming] in a sense, an automatic weapon in the service of a concrete wall and a series of trenches and fences' (Gordon 2008: 214–5).

Deleuze, Mann and Modernism: Musical Becoming in *Doctor Faustus*

Ronald Bogue University of Georgia

Abstract

Thomas Mann's *Doctor Faustus* traces the life of the composer Adrian Leverkühn, whose career culminates in the compositions *Apocalipsis cum figuris* and *The Lamentation of Doctor Faustus*. Mann treats *Apocalipsis* as the endpoint of a dangerous modernism allied to fascism, and *The Lamentation* as its partial antidote. From Deleuze and Guattari's perspective, however, *Apocalipsis* is a positive musical becoming-other and *The Lamentation* a regression. Crucial to the contrasting interpretations of *Apocalipsis* are two very different conceptions of modernity and fascism, that of Deleuze and Guattari providing a means of valorising becoming as a mode of aesthetic and political invention and redefining modernism and fascism.

Keywords: Thomas Mann, *Doctor Faustus*, modernism, fascism, musical becoming, atonal music, bourgeois humanism

Thomas Mann's *Doctor Faustus* (1947) may well be the greatest novel ever written about music. Although some have questioned the depth of Mann's understanding of music, pointing to his lack of formal training and his status as a mere enthusiast of the art rather than a practising musician, his attention to strictly musical elements of the work's imagined compositions, his grasp of the fundamentals of the art and their relation to literature, and his sense of music's position in the history of the West in general and Germany in particular are undeniably sophisticated and, in my judgement, quite profound. In preparation for the writing of *Doctor Faustus*, Mann undertook an ambitious course of study in music theory, and during the compositional process he made

www.eupjournals.com/dls

use of the considerable talents of Theodor Adorno, an accomplished musician and formidable philosopher, to fashion the musical sections of the work. Detractors of Mann's achievement have suggested that Adorno's importance is so great that he should be given equal credit for the novel, but for anyone who has attempted to fathom the complexities of Adorno's difficult essays on music, Mann's lucid presentation of the musical elements of *Doctor Faustus*, whatever their source, must be viewed as a victory in itself. That he is then able to integrate such materials within a moving and complex narrative is surely one of the great triumphs of the literary imagination.

Undoubtedly, the most significant of *Doctor Faustus*' imaginary musical works are *Apocalipsis cum figuris* and *The Lamentation of Doctor Faustus*, the last major compositions of Adrian Leverkühn, the novel's protagonist. The two works are presented as masterpieces of atonal music that voice the torment of modernism's struggle to reconcile an ascetic, intellectual rigour and a fascination with the mystical demonic. Notable in *Apocalipsis cum figuris* are experimental elements that Mann sees as representative of a dangerous tendency within modernism towards decadence, barbarism and animality. Some of those elements are honed, perfected and brought to an even greater level of intensity in *The Lamentation*, the result being a 'breakthrough' (Mann 1997: 509) that allows Leverkühn to transcend the perilous practices of the *Apocalipsis* and discover a way beyond the impasses of modernism. When approached through the aesthetics of the philosopher Gilles Deleuze, however, these same elements in the *Apocalipsis*, so decried by Mann, emerge as positive components of a general musical 'becoming-other', whereas the breakthrough practices of *The Lamentation* assume the guise of a negative betrayal of the potential created in the earlier work. Although Mann makes no simple equation of atonal music and Nazism, he does suggest that loose parallels exist between the cold detachment and demonic expressivity of musical modernism and the cynical, calculating rationality and cruel barbarity of Nazi politics and ideology. Some have criticised Deleuze's philosophy, especially as articulated in *Anti-Oedipus*, as promoting a politics of libidinal fascism. Such critiques, however, are based on the same assumptions that underlie Mann's critique of musical modernism, assumptions that are antithetical to the concept of becoming as a mode of aesthetic and political invention. When viewed from the perspective of Deleuzian becoming, Leverkühn's *Apocalipsis cum figuris* may, finally, be regarded as a model for musical innovation and creative activity in general, unlike *The Lamentation*, which represents a limited practice, and possibly a musical dead end.

I. Music and Literature

Doctor Faustus purports to be the biography of the fictional German composer Adrian Leverkühn, as told by Serenus Zeitblom, his lifelong friend. The novel follows two narrative lines. The first details the life of Leverkühn, from his birth in 1885, through his early education, his gradual decision to abandon the study of theology for music, his contraction of syphilis at a house of prostitution in 1906, his ascent as a composer, culminating in the production of his masterpieces *Apocalipsis cum figuris* in 1919 and *The Lamentation of Doctor Faustus* in 1930, to his collapse into madness that same year and his death in 1940. (The parallels between Leverkühn's and Nietzsche's lives are deliberate.) Zeitblom writes the biography from May 1943 to April 1945, interspersing his narrative of the composer's career with comments on the declining fortunes of Germany during the Second World War and his own anguished responses to the evils perpetrated by his country.

Zeitblom is a classical philologist and staunch defender of culture, learning, the arts, and the values of what he calls the era of 'bourgeois humanism' (Mann 1997: 372), stretching from the end of the Middle Ages to the outbreak of the First World War I. In his enthusiasm for 'ancient languages and their classical poets and writers' (49), Zeitblom savours 'that inner and almost mysterious bond between . . . classical philology and a lively and loving eye for man's beauty and the dignity of his reason – a bond made manifest in the very name we give the study of ancient languages, the "humanities," whereby the psychological connection between linguistic and human passion is crowned by the idea of pedagogy' (11). He claims that one may teach the exact sciences, of course, but never as a true pedagogue, and the same may be said of music:

> And it seems to me that that other, perhaps even more internal and yet strangely inarticulate language, the language of tones (if one may call music that) cannot be included, either, in the pedagogic, humanistic sphere, though I am well aware that music played an ancillary role in Greek education and in the public life of the *polis* generally. It seems to me, however, that despite the logical, moral rigor music may appear to display, it belongs to a world of spirits, for whose absolute reliability in matters of human reason and dignity I would not exactly want to put my hand in the fire. (Mann 1997: 11)

Language, literature and the humanities, then, are fundamentally different from music and the sciences, if only as the pursuits responsible

for cultural pedagogy. Music may be a language, but it is a 'strangely inarticulate language' and one that lacks 'reliability in matters of human reason'.

Zeitblom, like Leverkühn, sees music as an art allied in complex ways with mathematics, theology and the experimental sciences. Zeitblom notes that mathematics, 'as applied logic, which nevertheless stays within pure and lofty abstraction, holds a curious intermediate position between the humanistic and the realistic sciences' (Mann 1997: 50). In its abstraction, music belongs to the theological realm, as Leverkühn suggests in his remark to Zeitblom that music is ordered relationship and that 'Studying ordered relationships is ultimately the best there is. Order is everything. Romans thirteen: "For what is of God is ordered"' (50). Music has an 'inherent lack of sensuality', according to Leverkühn's mentor, Kretzschmar, and hence 'a secret bias toward asceticism' (67). Music '*per se*, music as pure abstraction', Kretzschmar asserts, may have as its 'deepest desire not to be heard at all, not even seen, not even felt, but, if that were possible, to be perceived and viewed in some intellectually pure fashion, in some realm beyond the senses, beyond the heart even' (68).

Music, then, as Leverkühn remarks, ' "has always seemed a magical union of theology and the fine sport of mathematics"' (Mann 1997: 140). Its alliance with theology, however, makes Zeitblom uneasy. He views religion as 'the feeling and taste for the infinite' (97), and as such a subject of study better left to 'our sense of piety, to the fine arts, to free contemplation, indeed to exact research as well' (98) than to formal theological argumentation. Yet Zeitblom knows that religion has always been, and will continue to be, a subject of logical disquisition, and 'in all ages theology has willy-nilly let itself be influenced by the scientific currents of its era' (98). In the Renaissance and the Enlightenment, this gave rise to 'liberal theology', which Zeitblom regards as an oxymoronic fusion of the rational and that which defies rational comprehension. Such a theology is 'cultured, but shallow' (99), in that it ignores the mysterious and darker sides of human experience. He notes that nineteenth-century theology has seen 'the infiltration of theological thought by irrational currents within philosophy, in whose domain the nontheoretical, the vital, the will, or instinct – in short, once again, the demonic – had long since become a major theoretical issue' (99). But if such thought is less shallow than liberal theology, it is also something the 'civilised human mind' cannot help but sense as 'uncanny'. 'For by its very nature, theology, once it is linked with the spirit of Life Philosophy, with irrationalism, runs the risk of becoming demonology' (99).

Zeitblom also finds this alliance of theological thought with the irrational in the natural sciences. When Leverkühn and Zeitblom were children, Leverkühn's father liked to entertain them with scientific demonstrations, which, says Zeitblom, 'always moved along one particular path, that is the mystical or intuitive semi-mystical, down which, it seems to me, human thought is almost inevitably led when in pursuit of the natural world' (Mann 1997: 20). Zeitblom finds the natural world 'eerie' (20) and ultimately demonic, for which reason Zeitblom later develops a 'lack of interest, bordering on distaste, for the pranks and mysteries of natural phenomena, for "nature" in general', and a 'devotion to the sphere of humane letters' (285). The natural sciences inevitably lead thought into mysticism, but they also do so through an engagement with the world of the senses, and in this regard, they resemble music. Although music has an 'inherent lack of sensuality' (67), it nonetheless cannot exist independently of the senses and material reality. According to Leverkühn, the purpose of rigid order in musical composition is to induce a 'chilling effect' in a work, since 'music has so much warmth of its own – like a cow stall, bovine warmth, one might say' (76). Music 'always does prior penance for its sensual realization', and its 'rigor, or what you might call the moralism of its form, must serve as the excuse for the bewitchments of its actual sound' (76). Music, thus, is open to the allure of the mystical, but also to the bewitching, animal warmth of sensuality. If, as Zeitblom asserts, the domain of the demonic is that of 'the nontheoretical, the vital, the will, or instinct' (99), then clearly music, like the natural sciences, has affinities with the demonic. And if, as Leverkühn claims, music is 'energetic will, energetic will *per se* – not as an idea, but in its reality', and 'this is almost a definition of God' (87), then theology, too, partakes of that same demonic domain, one that is at once elemental and mystical.

If music and literature meet at any point, it is in the voice. Language, after all, has a sonic dimension, and hence an inherent musicality. In its oral enunciation, language is embodied, rendered sensual, and imbued with emotional and affective nuance. For Leverkühn, music's sensuality is most evident in 'the resonating breath of the human voice, which probably has the most bovine warmth of any sounding board imaginable' (Mann 1997: 76). The human voice may be abstract, he claims, 'the abstracted human being, if you like. But it is an abstraction in about the same way as the naked body is abstract – it's practically genitalia' (76). In this sense music is a concrete abstraction, an essence of sensuality and sexuality manifest in matter, just as, in Leverkühn's words, music may be regarded as 'energetic will *per se* – not as an idea,

but in its reality' (87). In Leverkühn's view, music and speech 'belonged together, were ultimately one – language was music, music a language' (174). Zeitblom does not contradict Leverkühn when he makes this observation, but he clearly sees the music–language relationship as more problematic than does Leverkühn. Perhaps music is a language, but to Zeitblom it is a 'strangely inarticulate language, the language of tones' (11), and thus outside the domain of the humanities. Zeitblom distrusts music, yet loves it, a position that he recognises as paradoxical: 'That I am nevertheless devoted to it with all my heart is one of those contradictions which, whether a cause for joy or regret, are inseparable from human nature' (11). Perhaps that essential contradiction stems from the human voice, at once the vehicle of linguistic enunciation and musical expressivity.

II. *Apocalipsis cum figuris*

Zeitblom deeply admires Leverkühn's music, yet finds in his works disturbing tendencies that Zeitblom regards as symptomatic of a general malaise within modernism. The problem facing the modern composer is that the possibilities of tonal music have been exhausted – traditional forms seem clichéd, expressive devices empty and insincere. The bond between art and world has been shattered, and as a result the complete work of art as analogue of a social totality is no longer viable. To move beyond this impasse, Leverkühn develops an atonal approach to composition whose outlines are roughly similar to those of Schoenberg's twelve-tone method. Leverkühn aspires not only to invent the vocabulary of a renewed polyphony but also to enable the formation of a genuine community of artist and audience. Zeitblom, however, discerns a cold rationality in the composer's calculated manipulation of twelve-tone rows, one that ultimately denies freedom and agency. And in Leverkühn's revival of Renaissance and medieval forms and techniques, as well as his experimental violations of musical conventions, Zeitblom sees not the creation of a new community but the activation of the barbaric forces of the demonic.

The composition that Zeitblom presents as the best example of Leverkühn's tendency towards 'bloody barbarism and bloodless intellectuality' (Mann 1997: 393) is his 1919 oratorio, *Apocalipsis cum figuris* ('Apocalypse with pictures'). Loosely based on Dürer's 1498 series of 15 woodcuts of the same name, the *Apocalipsis cum figuris* incorporates texts from various sources, including the Revelation of St John of Patmos, the fourth-century *Vision of St Paul*, the writings

of the Venerable Bede, Mechtild of Magdeburg and Hildegard of Bingen, and Dante's *Inferno*, the end result being 'a new apocalypse of [Leverkühn's] own, a résumé in some sense of all previous proclamations of the end', a 'descent into hell, into which visionary power has worked the images of the beyond from both earlier, shamanistic levels and those of antiquity and Christendom, on up to Dante' (377). According to Zeitblom, the work is written in 'a compositional style subject to the strictest laws of intellectual and technical complexity' (378). The oratorio is clearly atonal, although its technique apparently is that of a 'free atonality', rather than a strictly Schoenberg-like row methodology, since it subsumes both tonal and atonal materials within its general design, the entire work governed by the paradox 'that its dissonance is the expression of everything that is lofty, serious, devout, and spiritual, while the harmonic and tonal elements are restricted to the world of hell or, in this context, to a world of banality and platitudes' (394). Leverkühn offers 'parodies of diverse musical styles', including 'burlesqued French impressionism, bourgeois drawing-room music, Tchaikovsky, music hall songs, the syncopations and rhythmic somersaults of jazz', yet 'always sustained by the main orchestra, speaking its serious, dark, difficult language and asserting with radical rigor the work's intellectual status' (395).

These are what Zeitblom regards as the oratorio's broad characteristics, which it shares with other works of Leverkühn. Its more specific features, however, are found only in this composition, and it is here that any reader familiar with the works of Deleuze (including those co-written with Guattari) must be struck, for they bear a remarkable resemblance to the elements of musical 'becoming-other' that Deleuze and Guattari discuss in *A Thousand Plateaus* and other texts.[1] (The resemblances may well be more than fortuitous, given the fact that Deleuze and Guattari briefly cite *Doctor Faustus* – without specific textual attribution – at one point in their discussion [Deleuze and Guattari 1987: 97].) First, Leverkühn's *Apocalipsis* makes frequent use of the glissando, a musical device in which Zeitblom has 'always tended to hear something anticultural, indeed anti-human, even demonic' (Mann 1997: 393). In Zeitblom's analysis, music begins when humans 'wrest from chaos a system of tones' and 'assign individual notes to song – which originally among primitive humans must have been a howl that glided over several pitches'. Hence, the glissando for him is 'a barbaric rudiment of premusical days' (393). Deleuze and Guattari also observe the disturbing effects of the glissando's dissolution of individual pitch differentiations, but they see in this device a

positive means of activating a virtual line of continuous variation immanent within musical material. The glissando's sliding sounds create zones of indiscernibility, passages of becoming, and if extended, the device discloses 'the plane of a generalized "glissando" implying the constitution of a statistical space in which each variable has, not an average value, but a probability of frequency that places it in continuous variation with the other variables' (Deleuze and Guattari 1987: 96). Deleuze and Guattari cite pieces by Berio and Schnebel as creative uses of a generalised glissando, arguing as well that *Sprechgesang*, *parlando*, and other uses of the voice to create indiscernible passages across a continuum from speech to singing are extensions of the principle of the glissando. Not surprisingly, in Leverkühn's *Apocalipsis* we find

> ensembles that begin as speaking choruses and only by stages, by way of the oddest transitions, arrive at the richest vocal music; choruses, that is, that move through all the shades of graduated whispering, antiphonal speech, and quasi-chant on up to the most polyphonic song – accompanied by sounds that begin as simple noise, as magical, fanatical African drums and booming gongs, only to attain the highest music. (Mann 1997: 392–3)

And at the conclusion of the first part of the oratorio, we hear another continuum of sonic becoming, a 'pandemonium of laughter', in which 'the giggle of a single voice' gradually gives way 'to a dreadful mayhem of yowls, yelps, screeches, bleats, bellows, howls, and whinnies, to the mocking, triumphant laughter of hell' (397).

The apocalyptic oratorio also elides gender distinctions in its treatment of the voice, as well as distinctions between the human voice and non-human instruments. The narrator of the oratorio, a role 'traditionally given to a tenor, is also written here for a male voice, but one almost in the range of a castrato, whose cold, reporterlike, matter-of-fact crowings stand in horrible contrast to the contents of his catastrophic message' (Mann 1997: 396). (Zeitblom notes that in the oratorio's premier performance, 'the role was sung in masterly fashion by a eunuchoid tenor named Erbe' [396].) The merging of voice and instrument is found in the role of the whore of Babylon, which is assigned 'to the most graceful coloratura soprano, and her virtuoso runs are at times so completely like a flute that they melt into the orchestra' (394). Conversely, the instruments often mime human voices: 'variously muted trumpets imitate the most grotesque vox humana – as does the saxophone as well' (394–5). (Admittedly, the vox humana is an organ stop, but that stop, as its name implies, is designed to imitate the human voice, and it is not certain whether Zeitblom is referring

to the organ stop or simply displaying witty erudition in likening the trumpets and saxophone to human voices.) This elision of gender and material distinctions Zeitblom regards with alarm, but Deleuze and Guattari see the practice as a creative 'machining of the voice' (Deleuze and Guattari 1987: 303). In their discussion of Dominique Fernandez's eccentric book on the disappearance of the castrato in opera and the subsequent partitioning of voices by gender, Deleuze and Guattari treat the castrato as an instance of the becoming-woman and becoming-child of the voice. In the castrato, it is not a question of 'imitating a woman or a child', but of deterritorialising the voice, such that it becomes 'unengendered' (304). And though Deleuze and Guattari agree with Fernandez that in Verdi and Wagner one can find a treatment of the voice that accentuates the differences between male and female voices, they argue that a compensatory tendency is activated in their works, whereby voice and instruments become increasingly indiscernible. Such practices represent a 'new threshold of deterritorialization of the voice', 'no longer that of a properly vocal becoming-woman or becoming-child, but that of a becoming-molecular in which the voice itself is instrumentalized' (308). This becoming-molecular they see as the guiding principle of modern music, especially evident in Varèse and Messiaen, whose works manifest in sound the molecular's 'capacity to make the *elementary* communicate with the *cosmic*' (308). One aspect of this molecular capacity that they discern in modern music is its exploitation of electronic media – something, we should note, that Leverkühn also employs, loudspeakers being used in his oratorio 'to produce directional and acoustic gradations that had never been achieved before' (Mann 1997: 396).

Zeitblom finds the oratorio's 'bloodless intellectuality' disquieting, but what disturbs him most is its 'bloody barbarism' (Mann 1997: 393). Zeitblom holds the traditional view that nature is opposed to culture, and that the rational order of culture is fashioned through the domination of irrational human nature, which, as we have seen, he associates with 'the nontheoretical, the vital, the will, or instinct – in short, once again, the demonic' (99). The irrational cannot be eradicated, but it must be controlled – hence Zeitblom's definition of culture as 'the reverent, orderly, I may even say, propitiatory inclusion of the nocturnal and monstrous in the cult of the gods' (12). Music's origin is paradigmatic of the formation of culture. '[T]he earliest achievement of the art of music', says Zeitblom, 'was to separate sound from nature, to wrest from chaos a system of tones, and to assign individual notes to song – which originally among primitive humans must have been a howl

that glided over several pitches' (393). For this reason, the glissando is ultimately 'anticultural, indeed anti-human, even demonic' (393), as are the other devices of musical becoming that Leverkühn employs.

III. *The Lamentation of Doctor Faustus*

But the *Apocalipsis* is not Leverkühn's final work, nor is it his greatest achievement, according to Zeitblom. Between the composition of the *Apocalipsis* in 1919 and the completion of his last work, *The Lamentation of Doctor Faustus*, in 1930, Leverkühn finds a means of realising his long-held ambition – that of creating music in an absolutely 'strict style' involving 'the total integration of all musical dimensions', such that 'free notes would no longer exist' (Mann 1997: 205). Leverkühn's means of realising his ambition is that of a Schoenberg-like twelve-tone row method of composition. During those same years of 1919 through 1930, while developing his twelve-tone technique, Leverkühn also suffers his greatest personal loss: the death of Nepomuk, nicknamed 'Echo', an innocent child who suffers excruciating and prolonged pain before succumbing to cerebrospinal meningitis. Echo is one of the few individuals Leverkühn has genuinely loved, and the demise of the child instils in him utter despair and a dark vision of the cosmos. It is in *The Lamentation* that Leverkühn gives full expression to his grief at Echo's death within the language of his new-found dodecaphonic 'strict style'.

In the *Apocalipsis*, Leverkühn had concluded part one with a chorus of 'hellish laughter', and then opened part two with 'the totally strange and wonderful children's chorus… whose sound is so sweet, might I say, so inaccessibly alien and superterrestrial that it fills the heart with hopeless longing' (Mann 1997: 397). The utter contrast between the two sections, however, is only superficial, for as Zeitblom realises, 'in its musical substance', the children's chorus 'is, for him who has ears to hear and eyes to see, a reprise of the Devil's laughter' (397). The technique that in the *Apocalipsis* generates 'the inner sameness of its children's angelic chorus and hell's laughter' (511) Zeitblom later finds extended to the entirety of *The Lamentation of Doctor Faustus*. What is realised in the *Apocalipsis*, he says, 'is a formal utopia of terrifying ingenuity, which now becomes universal in the *Faust* cantata, taking possession of the entire work and allowing it, if I may put it that way, to be totally consumed by its thematic element' (511). Early in the novel, Kretzschmar had established an opposition between 'harmonic subjectivity' and 'objective polyphony' (57) that Zeitblom

and Leverkühn had both come to embrace, and in *The Lamentation* Zeitblom sees a reconciliation of the seemingly antithetical elements of subjective expressivity and objective contrapuntal order. In Zeitblom's presentation of Western music history, the rise of harmonic music in the late seventeenth and eighteenth centuries, in which the melody and bass line take precedence over the other voices, eventually reaching the point that inner voices function primarily as simple chord accompaniments, represents an increased emphasis on the expressive and the individualistic in music. That harmonic system is a departure from the genuine polyphony of Renaissance compositions, in which all voices have equal importance. The movement from Renaissance polyphony to eighteenth- and nineteenth-century harmonic expressivity is paralleled by an increasing separation of music from ritual and religious functions, this growing secularisation being identified by Zeitblom as a movement from a 'cultic' to a 'cultural' epoch (65), from traditional communalism to bourgeois individualism. Paradoxically, it would seem, Leverkühn's *Lamentation*, says Zeitblom, 'this, his strictest work, a work of utmost calculation, is simultaneously purely expressive' (512).

Zeitblom's explanation of this paradox is that in this 'formal arrangement of ultimate rigor that knows nothing that is unthematic', in which 'free notes no longer exist', the music 'can now unfold outside all restraints – that is to say, abandon itself to expression' (Mann 1997: 512). *The Lamentation* is the product of 'the dialectic process by which strictest constraint is reversed into the free language of emotion, by which freedom is born out of constraint' (510). What is liberated by such constraint is expressivity. The essence of expressivity, Zeitblom claims, is to be found in the lament, and *The Lamentation* is one 'gigantic *lamento*' (511). The lament 'is expression *per se*, one might boldly say that all expression is in fact lament' (510). '[T]he expression of lament', Zeitblom adds, is 'expression in its first and primal manifestation' (512). Zeitblom's implicit argument, though never directly articulated, is that the personal, emotional dimension of music arises through the human consciousness of death and the experience of mourning. The lament is 'the expressive cry of the soul' (509–10), and as a primal element in music, it marks the emergence of organised musical sound from the chaos of spontaneous noise emitted by human animals, that noise 'which originally among primitive humans must have been a howl that glided over several pitches' (393). The universal nature of the lament's expressivity allows its articulation in all voices of a composition, and hence expression can exist in a work of the strictest polyphony, such as *The Lamentation*. Although expressivity is always individual, 'there

are no solos in *Faustus*' (512), the individual expression of lament being subsumed within the universal polyphony of *The Lamentation*'s strict order. The result is an essence of lament, 'and as such, negatively related to the finale of the Ninth Symphony [of Beethoven] with its variations on jubilation' (511), a renunciation of the Ode to Joy, a 'proudly despairing 'No!' spoken against false and flabby bourgeois piety' (515). Yet in this despair, Zeitblom discovers one final paradox: from this essence of lament, this 'irredeemable despair', emerges 'hope beyond hopelessness, the transcendence of despair', 'a light in the night' (512).

For Zeitblom, *The Lamentation* is a 'breakthrough' that transcends the 'bloody barbarism and bloodless intellectuality' (Mann 1997: 393) of the *Apocalipsis*. The barbarism of the *Apocalipsis* resides in such elements as its pre-human howls, its confusions of laughter, weeping, speech and song, its mixtures of high art and popular entertainment, and its periodic interjections of primitive, non-Western musical idioms. That barbarism is reinforced by the work's cold intellectuality, which manifests itself in Leverkühn's pastiche of styles and the parodic detachment with which he mocks traditional tonal devices. Early in his career, Leverkühn exclaims, 'Why must almost everything appear to me as its own parody? Why must it seem to me as if almost all, no, all the means and contrivances of art nowadays are good only for parody?' (143). In his various compositions from that early moment through the *Apocalipsis*, a thoroughgoing parodic sensibility informs his style. In *The Lamentation*, however, the extreme discipline of the twelve-tone method purges the work of all parody, all popular idioms, and all non-Western elements. The barbarism of the pre-human gives way to the primally human expressivity of lament, an emotional freedom paradoxically made possible through the formal constraints of the twelve-tone row. And in the polyphonic manifestation of individual lament within each of the voices, a new collectivity is discovered.

From a Deleuzian perspective, *The Lamentation* seems a much less transcendent achievement than Zeitblom claims. There is nothing wrong with exploring the possibilities of the twelve-tone row, but it represents only one way of renewing Western music, and Zeitblom's implicit praise of strict serial composition is that it rejects several lines of development that Deleuze would no doubt find promising. The danger of the serial technique is that it can lead to a hermetic elitism, and that its rigours can limit invention to the exploitation of fixed, finite permutations within a closed system. There is little to suggest that the constraints of the serial method represent a genuine breakthrough rather than a temporary escape from traditional tonality that may soon lead to

academic stagnation. Even more suspect than the exclusive triumph of *The Lamentation*'s formal method, however, is the explanation Zeitblom offers for the work's success. Zeitblom frames the work as a reconciliation of expressive subjectivity and polyphonic objectivity, achieved through 'the dialectic process by which strictest constraint is reversed into the free language of emotion' (Mann 1997: 510). What kind of dialectic this process may be, whether Hegelian or otherwise, is not specified, but it implies a transcendence of contradictions, limited in number and generated within a closed historical tradition. Deleuze's philosophy is decidedly anti-Hegelian, stressing difference as a generative, mutative force antecedent to the formation of any full-fledged contradictions. The object in Deleuze's thought is not to overcome given contradictions, but to exploit multiple differences that are immanent within a situation, though unrecognised in dominant conceptualisations of that situation. From this perspective, the *Apocalipsis*, with its heterogeneous disruptions of musical conventions, represents a much more promising source of future invention than *The Lamentation*. The rigors of *The Lamentation*'s method are designed to overcome the contradictions of an unavoidable historical impasse, whereas in fact its dilemma is a function of the narrow range of possibilities this conception of Western art music's history and development makes available. *The Lamentation*'s expressivity, in turn, exploits a negative, life-denying mentality, one in which primal emotion is found in a universal 'being unto death', the source of all expressivity. *The Lamentation* counters the Ode to Joy, and though Deleuze would join Zeitblom in rejecting the 'false and flabby bourgeois piety' (515) often associated with Beethoven's Ninth, he would not reject all joy and celebrate instead human mortality and loss. Paramount in Deleuze's thought is the embrace of a Spinozist joy and a Nietzschean affirmation of life, an affirmation of affirmation that runs counter to the Hegelian negation of negation and the nihilistic being unto death. Rather than loss and the absence of death, Deleuze seeks modes of invention that stress the active forces of life.

IV. Music and Nazism

Although Mann nowhere makes explicit the precise parallels he is drawing between aesthetics and politics in his novel, he clearly suggests that Leverkühn's *Apocalipsis* is informed by principles similar to those that shaped fascism, even if those principles have markedly different results, especially from an ethical standpoint, in the separate

spheres of politics and music. (Less certain are the political parallels to be drawn to *The Lamentation*, which for Mann may represent a solution to the dilemma posed in the *Apocalipsis* that is without a counterpart in the realm of politics.)[2] The 'bloody barbarism' of the *Apocalipsis* has as its political counterpart the Nazi racial and national ideology of blood, soil and will, a form of 'naturalistic atavism' (Mann 1997: 393) that overwhelms humanist culture with a cultic celebration of demonic energy and desire. The 'bloodless intellectuality' of the *Apocalipsis* perhaps corresponds to the disciplinary order of the repressive Nazi state and the cynical, cold efficiency of its death machine. More important, however, are the mystical tendencies behind this intellectuality, tendencies that reinforce the irrational forces of barbarism. Music's mysterious elements, in Zeitblom's analysis, ally it to theology and natural science. Zeitblom, as we have noted, describes religion as 'the feeling and taste for the infinite' (97), and music, in its religious guise, is, in Leverkühn's words, 'energetic will *per se* – not as an idea, but in its reality', and 'this is almost a definition of God' (87). In its alliance with natural science, music furthers a mystical affirmation of the demonic infinite within the material world. What brings bloody barbarism and bloodless intellectuality together, then, is a celebration of will and the demonic, at once ethereally detached and sensually engaged, and this coincidence of mysticism and barbarism informs both the *Apocalipsis* and Nazism.

If one were to accept the terms of Mann's analysis, one might well conclude that the musical becoming advocated by Deleuze and Guattari is as misguided as that of Adrian Leverkühn in the *Apocalipsis*. And indeed, some have argued that Deleuze and Guattari are simply promoting a rehash of Schopenhauer, Nietzsche and Marinetti that is as dangerously fascistic now as it was in the first half of the twentieth century.[3] Such an identification of Deleuze and Guattari's musical becoming as proto-Nazism, however, is indefensible. The Nazi ideology of blood and soil seeks a fixed identity, one grounded in an essential biological, racial 'Germanness', which itself has permanent bonds to a traditional, primeval territory. Far from affirming dynamic processes of metamorphosis, as do Deleuze and Guattari, Nazi apologists oppose all forces of 'becoming-other', especially the forces of racial impurity and territorial usurpation. The Nazi celebration of the will, too, has no parallel in Deleuze and Guattari's thought. The Nazis' appropriation of Nietzsche's will to power, in Deleuze's analysis, is a perversion of Nietzsche's thought. In Deleuze's reading, the affirmative will to power is an affirmation of metamorphosis, a will to expand one's powers

of affecting *and being affected by* other entities. The Nazi 'triumph of the will', by contrast, is a negative will to power *over others*, and as a result, a will to resist outside influences. It is essentially a reactive will that opposes any becoming-other – indeed, a will that aims at the complete domination of the other and its mutative force. Deleuze and Guattari do indeed stress music's inextricable connections with our biological existence within a material environment, but never in the service of racial, national or territorial identities. And though they second Nietzsche's call for an art and a way of life that affirm metamorphosis, they never embrace an irrational mysticism of power and domination.

But one might also use Deleuze and Guattari to critique Mann's analysis and to show that Leverkühn's apocalyptic oratorio, rather than representing the dead and dangerous end of modernism, suggests creative paths for the future development of music. For Deleuze and Guattari, music is not structured by any clear-cut divide between nature and culture, or the rational and the irrational. Deleuze and Guattari characterise music as the 'creative, active operation that consists in deterritorializing the refrain' (Deleuze and Guattari 1987: 300). The refrain is Deleuze and Guattari's term for any rhythmic pattern that organises an environmental system. According to this definition, a bird in its habitat may be characterised in terms of a multitude of refrains, including those of: the bird's developmental trajectory from gestation through maturation to its death; the regular movements of the bird as it forages, mates and interacts with conspecifics; the developmental trajectories and movements of surrounding conspecifics, as well as those of other species with which the bird interacts (predators, prey, symbionts); ambient climatic patterns, rhythms of plant growth, cycles of microbial florescence; and so on. Within this network of refrains, the bird's song constitutes an additional refrain, one that is emergent within its lifeworld, and thus, though distinguishable from the other refrains, ultimately inseparable from its world. Likewise, human music emerges from the refrains of a human lifeworld, gaining relative autonomy as it 'deterritorialises' the refrains that constitute a given environment. What Deleuze and Guattari mean by the musical deterritorialising of refrains is that music engages the surrounding patterns of a lifeworld, extracts them from their context, and thereby detaches them or 'decodes' them, and then gives them a new function within the self-referential system of a given musical language. As an illustration of this process of 'deterritorialising' a natural refrain, Deleuze and Guattari offer the instance of Olivier Messiaen, who

employs birdsongs in many of his compositions.[4] Messiaen claims to reproduce birdsongs in his music with absolute fidelity; however, he adds that the tempi of the birdsongs must be slowed to a human speed, their micro-intervals must be stretched to fit a chromatic scale, and their timbres must be rendered in complex chords and combinations of instruments. The end result, he confesses, is a rendering of birdsong that few ornithologists would be able to recognise, and it is this resultant product that Messiaen then combines with other rhythmic, melodic and harmonic elements within his compositions to form a coherent work of art. In Deleuze and Guattari's terms, Messiaen has 'deterritorialised' the birdsong, subjected it to a mutative 'becoming-other', and 'reterritorialised' it within a musical composition. Although Messiaen's handling of the refrains of birdsong may seem idiosyncratic, Deleuze and Guattari insist that it is paradigmatic of the art of music as a whole.

For Deleuze and Guattari, refrains come into existence as regularised, relatively fixed patterns emergent within zones of variation, continuums of flux and modulation. These zones of variation, flux and modulation remain immanent within each refrain. The refrain 'territorialises' the metamorphic variations, restricting and regulating them, but the potential for destabilising the refrain, or 'deterritorialising' it, continues to play through the refrain. When the potential of this deterritorialising force is activated, a process of 'becoming-other' is inaugurated, a process that may lead to the formation of new, unforeseeable and unpredictable refrains. In musical terms, what this means is that immanent within the chromatic scale of Western art music is a continuum of sonic material in continuous variation, and that the exploitation of the glissando is an activation of that continuum and the instigation of a 'becoming-other' of the intervallic system. Likewise, a zone of variation includes male and female voices in a single continuum that the composer may exploit in a 'becoming-other' of gendered voices; another zone of indiscernibility allows a 'becoming-other' among voices and instruments; a third continuum traverses wails, cries, laughter, speech and song, which may give rise to yet another 'becoming-other' of these expressive components; and so on.

Also immanent within all zones and continuums of variation and the refrains that organise them is a primal affectivity, which is present in all natural entities and determinable through their relative powers of affecting and being affected by other entities. This primal affectivity is manifest in diverse forms of perception, emotion, behaviour, cognition and so on, each particular manifestation of that affectivity being

characteristic of a given organism. In this view, therefore, no radical distinction may be maintained between the various degrees of inner experience that in a given creature may range from sensate responses to the most abstract cogitation. In Deleuze and Guattari's view, then, any analysis that predicates a qualitative opposition between emotion and reason, such as Zeitblom posits in his characterisations of music, is misguided. Just as the human lifeworld emerges within and is inseparable from the lifeworlds of other natural organisms, and the productions of human culture are themselves inseparable from the larger lifeworld of human beings, so too the most elevated of intellectual activities, such as composing and performing music, can never be separated from the affective forces that play through humans and their surrounding environment.

Hence, processes of deterritorialisation and reterritorialisation – those of stratification and destratification, fixing and unfixing, coding and decoding – are constantly at work in our world. The immanent lines of deterritorialisation within material, social and mental structures provide modes of invention that are not exclusively rational or irrational, and they are operative to varying degrees in all such structures. Human culture is not separate from but emergent within nature; it is a specific dynamic configuration of de- and re-territorialising forces embedded in a cosmic lifeworld. Musical deterritorialisation modifies refrains, transforms them, but does not radically separate them from the natural world, since the materials of the musical composition are organised, or reterritorialised, within the work, which itself participates in the play of forces within the world. The lines of musical deterritorialisation are paths of becoming, and Deleuze and Guattari recognise the dangers of activating virtual processes of becoming. Those dangers, however, cannot be escaped by avoiding all becoming – in fact, such an effort would be impossible. The dangers are related to speed and contagion. Deterritorialisation can proceed too rapidly, everywhere and all at once, the result being a suicidal rush into a black hole. This is the apocalyptic becoming of addiction, terrorism, the suicidal state, and so on. Deterritorialisation can also become cancerous, as specific sites of repressive organisation multiply and choke out competing structures and processes. Such becoming gives rise to what Deleuze and Guattari call the fascist body without organs.[5] Thus, the horrors of the Nazi state, according to them, are a matter of destructive speeds and cancerous contagion, the Nazi death machine being an all-consuming black hole and the myths of blood, soil and will being manifestations of an ever-spreading ideological metastasis.

Leverkühn's oratorio is open to the dangerous forces of apocalyptic, suicidal becoming and cancerous, fascistic becoming, and perhaps Zeitblom is right to fear those forces. But such forces need not lead to destruction or barbaric repression. If treated with caution, they may foster new forms, processes and relations. The oratorio's uses of the voice, its becoming-woman, becoming-child, and becoming-molecular, offer possibilities for the transformation of vocal music. Its animalistic elements disclose the existence of paths like that taken by Messiaen, who incorporates motifs from birdsongs and sonic landscapes into his compositions. The so-called 'primitive' components of the oratorio, its 'magical, fanatical African drums and booming gongs' (Mann 1997: 393), far from undermining culture, open Western art music to the musics of diverse non-Western cultures, with their complex rhythms, micro-tone scales, subtle timbres and alternate practices. And Leverkühn's parodies of popular musical forms – especially jazz – might well lead not to mockery but to the renewal of Western art music via an appropriation of alternative ways of music making. Perhaps Leverkühn's oratorio is excessive, in that it exploits all these modes of becoming at the same time, but if explored with caution, if activated selectively and slowly, these becomings could disclose lines of powerful musical invention.

It is perhaps too easy to find fault with Mann from the vantage of the twenty-first century. When he began writing *Doctor Faustus* in 1943, Germany and much of the world were engaged in a conflict whose outcome was far from certain, and by the time he finished the novel in 1946, the consequences of that struggle were still largely undetermined. Understandably, and correctly, he viewed his historical situation as a moment of crisis, in which something had gone terribly wrong in Western culture, and specifically in German culture. His sense that Western art music had entered a similar period of crisis in the years leading up to the Second World War was also accurate, at least from the perspective of many serious composers, and his effort to draw parallels between the political and aesthetic developments of modernity represented a valiant attempt to correlate the spheres of politics and the arts, without reducing one to the other, and to diagnose the problems, attempted solutions, and ultimate failures that have arisen in the modern era. The proliferation of alternative musical practices and vocabularies in post-Second World War art music has no doubt made Mann's high modernist stance – either a regressive repetition of tonal platitudes, or an aggressively experimental atonality – seem arbitrarily limited. But we would be hopelessly deluded to think that we have learned the lessons

of Nazism and Auschwitz and moved definitively beyond those crises. In Mann's view, the era of bourgeois humanism came to an end in 1914, and that humanistic culture found no adequate replacement in the ensuing decades. Mann recognised that a return to such a culture was impossible, but his analysis of the possibilities for developing alternative cultural formations was, I believe, limited by his fundamental conceptions of human nature and human culture, conceptions that also shaped his approach to music and aesthetics as a whole. In Deleuze's thought I find more promising means of reconceiving the situation of humans, their histories and their cultures within the world. That thought furnishes a new perspective on the compositions of Leverkühn, one that confirms the perspicuity of Mann's perception of modernism's tendencies while indicating the limitations of his understanding of those tendencies. Deleuze also helps us reframe Mann's narrative of the political events of his day, such that the parallels Mann draws between aesthetics and politics may be seen as much less certain than he believed. By no means, however, do I see Deleuze's thought as a definitive guide to an understanding and transcendence of the fascist mentality and the abyss of the Holocaust. But his thought does, I believe, suggest fruitful ways of construing Mann's political narrative that open up possibilities he did not envision – and perhaps could not envision, given his historical situation.

Notes

1. I discuss Deleuze's writings on music at greater length in Chapters 1 through 3 of *Deleuze on Music, Painting, and the Arts* (Bogue 2003).
2. For an illuminating, suggestive, and admittedly speculative reading of the musical-political parallels of *Doctor Faustus*, see Cobley 2002; for a more restrained treatment of the subject, see Carnegy 1973. Useful commentary on this topic is also provided in Scaff 1998.
3. A particularly stark instance of this critique may be found in Manfred Frank's *What Is Neostructuralism?* (Frank 1989: 315–58). Frank characterises *Anti-Oedipus* as a 'kind of political and intellectual flipping-out, a spiritual Calibanism', which he regards as inflected with deleterious associations and tendencies. 'We only have to remind ourselves of the already fascistically colored neovitalisms that, as a result of the rediscovery of Gobineau, Nietzsche, and Chamberlain, are creeping back, this time not so much in Germany, the homeland of blind respect for blind productivity, as in France. And they are all the more dangerous due to their anarchist touch that displeases the average bourgeois. But to displease the bourgeois is, as I have said, in itself not enough: after all, even Nazism was a "completely unbourgeois adventure"' (342). For an especially odious effort to associate Deleuze and Guattari with Nazis and fascism via their philosophy of nature, see Ferry 1995: 112–4.

4. See Bogue 2003, Chapters 1 and 3, for a more detailed exposition of Messiaen's compositional methods.
5. For Deleuze and Guattari's most detailed treatment of the issues of speed, contagion, black holes and the fascist body without organs, see Deleuze and Guattari 1987: 161–6.

Book Reviews

Chrysanthi Nigianni and Merl Storr (2009) *Deleuze and Queer Theory*, Edinburgh: Edinburgh University Press.

Queer theory, having become academic, systemic and institutional, is always in need of a good buggering. Buggering philosophy, in fact, was a self-proclaimed practice of Gilles Deleuze (Deleuze 1995: 6). This form of 'posterior' writing 'follows behind' and bends 'normalised' interpretations and understandings of critical philosophy. It likewise proliferates in critically queer philosophical renderings – in attempts to rethink, redress and redefine the parameters of queer theory. The litany of queer literati who contribute to these renderings of queerness range from Judith Butler, who situates critical queerness through discursive negativity to oppose all phallocentric, heteronormative paradigms (cf. Butler 1993), to David Eng, Judith Halberstam and José Muñoz (2005), who affirm the radical promise of queerness through its indeterminable re- and de-constructive potential. These authors affirm how queerness remains 'contingent on its potential obsolescence' – a necessary condition for reconsidering normalising, 'positivist assumptions', even under the guise of 'queer liberalism' – which is also why queer theory must account for multiplicities of queer Diasporas or 'minority philosophies' (3–4).

Crossing queer (theory) with Deleuze, the authors in the collection *Deleuze and Queer Theory* illustrate how the potentiality of queerness might be productively buggered towards new configurations that radically destabilise the possibility of queerness maintaining its fixity. The introduction to this collection initiates 'productive desire' as its overarching promise – a philosophical undertaking that aims to thwart and twist reductive assumptions that might intend to unify the philosophical entries within. Instead, these authors prompt unstable unifications – a 'we' reverberating 'stuttering effects' that are 'endlessly improvised, indefinite' – which envision the potential to mix, cross or otherwise move in between philosophies towards hybrid becomings and

Deleuze Studies 4.3 (2010): 432–450

'qualitative multiplicity' (6–8). The affirmation of 'becomings' is what allows these authors to think queerness aslant – 'queer' sheds fixity as a container for subjectivity in a project that moves towards (in Patricia MacCormack's terms) the 'verbing not nouning' (146) of material bodies which must continually move, become . . . something otherwise, elsewhere, virtually everywhere, nowhere.

Claire Colebrook's chapter, 'On the Very Possibility of Queer Theory', formulates the necessity of contextualising queer (theory) within affirmative contexts. This formulation initiates a dialogue that weaves and wanes throughout the collection: each author envisions pathways towards queerness as positive difference – as the accumulation of relations – instead of iterative difference afforded through difference and repetition. This ontological shift, which emphasises the non-discursive materiality of bodies as multiple and rhizomatic, becomes a radical intervention in much of queer theory to date. The shift is radical in the sense that it promulgates a new path towards 'becoming-queer.' Queered assemblages capable of new becomings emerge as Deleuzian philosophies productively bugger our fecund recollections of (non-Deleuzian) queer theories about discourse or power (Butler 2004), desire (Edelman 1994, 1995; Sedgwick 1985; 1993), and politics (Halberstam 2005; Warner 1999). While becomings emerge and flow through this entire assemblage of texts, the first several chapters raise an interesting question: if I desire to write about 'becoming-queer', must I begin by being Butlerian (that is, understanding and identifying with queer performances of subjectivity or being) and decisively move into becoming-Deleuzian?

Butler is recognised as notable (to different degrees by the authors in this collection) for envisioning 'exemplary' queer bodies, but Colebrook insists on a Deleuzian departure that moves beyond the queer as a discursive subject/self towards queer non-being. Verena Andermatt Conley contributes to this departure by suggesting how the philosophies of Deleuze and Guattari enact 'queering' through attacks on 'normality and enforced behaviour in a capitalist, institutionally bourgeois disciplinary society' (24) to produce becomings as well as multiplicities. Queer becomings move beyond homosexuality to include other minorities because queer assemblages utter: 'no one *is* homosexual' (28). This movement, in Hickey-Moody and Rasmussen's formulation, occurs with a desire to 'craft sexual subjectivities that refute majoritarian readings of gender and sexuality' (38). But, while Deleuze and Guattari refuse subject positions like 'homosexual' because they are constructed through majoritarian discourse – a shift that is often noted

as a move away from discursive subject construction – Hickey-Moody and Rasmussen find a productive 'coupling' between Deleuze, Guattari and Butler. The effectiveness of their chapter emerges from the dialogue between these affirmative and negative philosophical structures whereby each theory, rather than 'neatly fitting' together, vibrates against the other in an attempt to rethink psychoanalysis, desire, partial objects and humanism.

Crossing Butler with Deleuze ultimately elaborates the intricacies of (non-)being, to reveal the potentiality of queer becomings. Becomings always transgress subjectivity by occupying durations between heterogeneous terms. In this sense, every becoming is minoritarian and queer, enabling new becomings towards non-identity. Becomings occur within indeterminable durations, and each discussion about becomings can offer a new slant on the process that causes these queer proliferations. By Jonathan Kemp's account, in his chapter 'Schreber and the Penetrated Male', 'becoming-Deleuze' is 'becoming-queer' (166). This is, as Kemp suggests, a productive buggery that takes philosophy from behind; Kemp buggers psychoanalysis to illustrate how buggery challenges majoritarian interpretations and, through this process, can inspire becomings towards the perpetual rebirth of philosophy.

Becomings are located through sensation in the chapters 'Every "One" – a Crowd' by Dorothea Olkowski and 'The Adventures of Sex' by Luciana Parisi. Olkowski employs Henri Bergson's philosophy on ontological memory to understand experiential reception; the 'queer' Brittlestar – a 'creature that has no eyes, but is all eyes', through nerve reception (54) – illuminates how all beings experience sensitivity beyond singular senses through a multiplicity of interactions that influence the becomings of all beings. Parisi addresses sensation as the potentialities of multiple connections that emerge within 'infinitesimal durations' (83), as becomings connect in innumerable and uncertain ways. Queerness cannot be defined from one point of view or within one becoming but, as Parisi explains, iterations of sex illuminate how sensation and 'pure experience' perpetually vary (87). Sensual, sexual bodies are further elaborated in Chrysanthi Nigianni's chapter 'Butterfly Kiss', on lesbians, and Margarit Shildrick's chapter, 'Prosthetic Performativity', on the disabled body. These chapters rupture subjectivities marked by 'lack' in majoritarian discourse to proliferate desiring (and desirable) bodies, desiring machines, assemblages and multiplicities.

This perpetual process of desiring, becoming inter-connected, and becoming multiple is made explicit in writings on hybridity, where

the emphasis on in-betweens by Hickey-Moody and Rasmussen re-emerges in the chapters 'Queer Hybridity' by Mikko Tuhkanen and 'Unnatural Alliances' by Patricia MacCormack. Tuhkanen considers (queer) hybridity through Anzaldúa's writings on mixedness. Queerness provokes an 'ontology of connectedness between and a crossing of temporalities and cultures' (98); queerness is understood as 'inextricable' mixing, as involution and becoming, which '(re)turns' to virtuality as a queer breeding. MacCormack, in (re)turn, cautions against conceptualising hybrids as beings that can be signified within a taxonomy. She emphasises how hybrids are 'inherently unnatural' – resistant to naturalisation – as becomings in 'verb'-tense. As verbs and not nouns, hybrids enact perpetual and positive (transformative) becomings, which enable the deterritorialisation of bodies (145–8).

The emphasis on 'verbing' in MacCormack's chapter reveals the insidiously desirable potential that emerges in between Deleuzian and queer theories: to understand queer(ing) in verb-tense, as incredibly active becomings, which perpetually mobilise bodies (and their connections, assemblages) otherwise and elsewhere. This also, in various forms, prompts a return to the earlier question: do I/we need to pass beyond 'being Butlerian' towards Deleuzian-queer-becomings? Is it possible to affirm a productive dialogue or mixing between queer theories and those of Deleuze and Guattari? And, of significant concern, do I/we even *want* to transgress queer(ing) subjects as they have been symbolically and discursively constituted? While this assemblage of texts rightfully (re-)invigorates 'queer' with potentiality and instability, it remains unclear whether the 'queer becomings' in this collection mobilise queerness beyond its conceptualisation by other queer theorists.

Judith Butler affirms queerness as a contingent term (Butler 1993: 230) and Tuhkanen reminds us of the etymology for queer, traced in the work of Eve Kosofsky Sedgwick, which functions as a 'constitutive crossing, of a movement athwart' (97). One could say that subjects (or subjectivities), in these formulations, are always on the move. It is also unclear if queer becomings must occur within Deleuzian and Guattarian assemblages or if these potentialities can emerge from other philosophical traditions. Consider queer/ed psychoanalysis: Lee Edelman (2005) reveals the death drive to be incredibly active, insisting that identities cannot congeal in the relentless movements towards destruction. Leo Bersani (1987, 1995) envisions the productive power of self-shattering afforded by the overflow and excess of sameness (not lack) in homosexual relations – which Tuhkanen rightly aligns with

Anzaldúa and Deleuze as thinking in 'virtualities'. Neither employ Deleuze, Guattari or schizoanalysis as a path towards multiplicity or uncertainty/potentiality, but they could.

There are numerous, indeed inexhaustible, potentials for employing the methods found within this assemblage of queer becomings, an assemblage of texts which productively (de)stabilise and (re)produce queer(ness) through a (albeit, buggered) foray into and beyond queer theories. For the (queer) theorist, while reading this collection and ingesting the Deleuze and Guattari punch, it becomes possible to imagine how to pursue philosophical crossings, mixings and hybrids for all of the potentiality they offer 'queer(ness)'. It may only require me/you/us to thwart (mis)perceived theoretical oppositions in order to mess with 'Mister-In-Between' (41).

Joe Hughes (2008) *Deleuze and the Genesis of Representation*, New York: Continuum.

Joe Hughes' recent study *Deleuze and the Genesis of Representation* makes the apparently straightforward claim that Deleuze's 'middle period', and indeed beyond, should be read as a consistent and repeated meditation on the processes of the constitution of representation. Its syntheses, and their necessary constitutions of subjectivity, of forms of production and of time provide a tangibly coherent theme across these apparently quite different texts. Running counter to the image of Deleuze as an endlessly inventive concept factory, Hughes unequivocally reads *The Logic of Sense*, *Anti-Oedipus* and *Difference and Repetition* as each in their own way articulating a systematic phenomenological return to essentially the same process of the constitution of experience. Despite its beginning with and constantly emphasising the transcendental, 'Deleuze's thought ends in phenomena, an empirical consciousness of fully individuated objects' (6). But Hughes' text is more than a review of Deleuze's relations with phenomenology. As the Preface makes clear, while the influence of Merleau-Ponty and Heidegger on Deleuze has not escaped critical notice, the 'Husserlian inspiration behind Deleuze's work' has been overlooked. Given the few direct references to Husserl in the books in question, this is understandable. But Hughes makes a strong case particularly for the relevance of Husserl's late work in understanding Deleuze's treatment of genetic constitution. This locating of the basic motivation behind these texts in a consistent body of influence is the key to Hughes' presentation of Deleuze's work as the project of 'a systematic and totalizing thinker' (157) occupied with the problem of genesis 'from the very first book to the last' (15). Deleuze is of course well known for describing his philosophy as classical and metaphysical, and his thought as 'like a hill' which changes very little, especially in contrast to Guattari's (in)famously volatile hyperactivity. Hughes' skill lies in looking into this immobility and highlighting the ways in which key themes and indeed structuring processes persist at the heart of key texts.

In so doing Hughes carries out a task which bears comparison with literary detective work. The comparison may seem ad hoc, but it helps to emphasise just how engaging and well-written Hughes' study really is, drawing on the work of Husserl, among others, to bear witness to Deleuze's phenomenology. Moreover, while few would underplay the importance of literature to Deleuze, Hughes implies that we might well to take its formal influence even more seriously. We are reminded

early on that *The Logic of Sense* describes itself as 'an attempt to develop a logical and psychological novel' (20), and Hughes takes this reference at its word. His detective work attempts to unravel story from plot and to draw a series of incisive deductions and conclusions with something of the style of a sleuth tracing the clues in a particularly thorny case.
